HERZOG, RUDOLF (1869-). A popular German novelist (see VOL. XI). In the first two years of the War he abandoned fiction and wrote the following volumes of verse: *Ritter, Tod und Teufel* (1915); *Von Sturmen, Sterben, Auferstehen* (1916), and the dramatic poem *Stromübergang* (1916). He later wrote: *Die Stollenkamps und ihre Frauen*, a novel (1917); *Jungbrunnen*, a volume of stories (1918); *Germaniens Götter*, a book of German myths (1919); *Die Buben der Frau Opterberg*, a novel (1921).

HESS, ALFRED FABIAN (1875-). An American pediatricist distinguished for his original researches into certain affections of childhood, notably rickets, scurvy, tuberculosis, blood states and affections of the stomach and intestines. Born in New York City, he was educated at Harvard and at Columbia, receiving his medical degree from the College of Physicians and Surgeons in 1901. After studying pediatrics in Europe, he was made a professor of that chair in the University-Bellevue Medical College. The record of his work in pediatrics and experimental pathology is contained in 70 or more papers published in periodical literature.

HESS, MYRA (1890-). An English pianist, born in London. At the age of five she began to study the piano and two years later entered the Guildhall School of Music, where she graduated as winner of the gold medal. After further study under Tobias Matthay, she made her debut in London, in January, 1908, winning immediate success. She then made tours of Holland and France. Upon her American debut (New York, Jan. 24, 1922) she became a prime favorite in the United States, not only as soloist, but also as a fine ensemble player.

HESS, VICTOR (1883-). An Austrian professor of physics and contributor on radio-activity, atmosphere electricity, and kindred subjects to the publications of the Academy of Science in Vienna.

HESSE, HERMANN (1877-). A German novelist and poet (see VOL. XI). He took up his residence in Switzerland before the War. His recent works include: *Rosshalde* (1914); *In der alten Sonne* (1914); *Musik des Einsamen* (1915); *Knulp* (1915); *Am Weg* (1916); *Briefe ins Feld* (1916); *Schön ist die Jugend* (1916); *Marchen* (1919); *Kleiner Garten* (1919); *Klingsors letzter Sommer* (1920); *Zarathustras Wiederkehr* (1920); *Blick ins Chaos* (1920); *Wanderung* (1921).

HETERODYNE. See RADIO TELEGRAPHY.

HEWLETT, MATRICE HENBY (1861-1923). An English novelist (see VOL. XI). His later books include: *A Lover's Tale* (1915); *The Little Iliad* (1915); *The Song of the Plow*

(1916); *Thoughts of Treadholt* (1917); *Penelope and Paraiul* (1917); *The Village Wife's Lament* (1918); *Flowers in the Glass*, poems (1920); *In a Grecian Shade* (1920). *Welshman Essays* (1922).

HEYCK, EDUARD (1862-). A German historian. He was born at Doberan and studied at Leipzig, Jena and Heidelberg. He was professor at the universities of Freiburg and Heidelberg, and librarian at Donaueschingen. Included among his later works are: *Die Kreuzzüge und das Heilige Land* (1900); *Frauenschönheit im Wandel von Geschmack und Kunst* (1903); *Wilhelm von Oranien* (1908); *Florenz und die Medici* (1909); *Das Deutschland von Morgen* (1917); *Parlament und Volksvertretung* (1918); *Hohenfeuer* (1920).

HEYMANN, LILA GUSTAVA (1868-). A native of Hamburg, active from her youth in welfare work and municipal reform. She was instrumental in securing public baths, commercial courses for girls, and establishing club and lunch rooms for women workers. She engaged in propaganda for the abolition of the *Sittenpolizei*, worked for child protection and was active in municipal and communal reforms in Munich. She also wrote works about the sex problem and hygiene for young people.

HIBBARD, BENJAMIN HORACE (1870-). An American agricultural economist, born in Bremer County, Ia. He graduated from the Iowa State College of Agriculture and Mechanic Arts in 1898, and took postgraduate courses at the University of Wisconsin and in Germany. In 1910, he was special agent in the agricultural division of the Bureau of the Census, and in 1913, was appointed professor of agricultural economics at the University of Wisconsin. In 1918 Professor Hibbard became head of this department. He was a member of several societies and wrote *Effect of the Great War on Agriculture* (1919), and *Marketing Agricultural Products* (1921).

HIBBEN, PAXTON (1880-). An American war correspondent and publicist, born at Indianapolis, Ind. He graduated from Princeton University in 1903 and studied law at Harvard. In 1906, he was admitted to the bar. Entering the diplomatic service, he served as Secretary of Legation at Russia, Mexico, Colombia, Holland and Chile, retiring from the service in 1912. He acted as war correspondent in Europe for several papers and magazines from 1915 to 1917, and in 1921 was secretary of the Russian Commission of Near East Relief. During the War he served as first lieutenant of field artillery and also with the Finance Bureau, and in the office of the Inspector-General. In 1919, he was on duty with the military mission of Armenia and was staff correspondent for the *Chicago Tribune* from 1919 to 1920. He wrote *Constantine I and the Greek People* (1920), and contributed many articles on subjects relating to the Near East to magazines.

HICHENS, ROBERT SMYTHE (1864-). An English novelist (see VOL. XI). Among his later books are: *In the Wilderness* (1917); *Snake-Bite* (1919); *Mrs. Marden* (1919); *The Spirit of the Time* (1921).

HICKS, FREDERICK CHARLES (1875-). An American librarian and educator, born at Auburn, N. Y. He graduated from Colgate University in 1898 and from the Georgetown Law School in 1901. After several years spent in

practice of law, he was appointed librarian at the United States Naval War College at Newport, serving from 1905 to 1908. In 1908-09, he was assistant librarian of the Brooklyn Public Library and from 1911 to 1915 was law librarian and from the latter date associate professor of legal bibliography at Columbia University. He was the author of *New World Order* (1920), *Men and Books Famous in the Law* (1921), and edited several historical series.

HICKS, FREDERICK CHARLES (1863-). An American economist, born at Capac, Mich. He was graduated from the University of Michigan in 1886, where in 1890 he also received his Ph.D. During 1891-92 he was instructor in economics at the University of Michigan, and then for eight years was professor of history and political economy at the University of Missouri, but in 1900, accepted a call to the chair of economy and commerce at the University of Cincinnati. He became president of the latter institution in 1920. During 1888-90, he served on the United States Census and later was supervisor of the 13th United States Census in the First District of Ohio. In addition to many technical papers, reports and monographs contributed variously, he is the author of *Lectures on the Theory of Economics* (1901) and *Competitive and Monopoly Prices* (1911).

HIDES. See LEATHER; LIVE STOCK.

HIGGINS, WILLIAM VICTOR (1884-). A painter and teacher, born at Shelbyville, Ind. He studied at the Art Institute in Chicago and at the Academy of Fine Arts there. In Paris, he was a pupil of René Menard and Lucien Simon, and when he was in Munich he studied with Hans von Hyeck. He is an Associate of the National Academy. Among his pictures in permanent exhibitions are his "Moorland Gorse and Bracken" in the Municipal Gallery, Chicago; "Moorland Piper," Terra Haute Art Association; "Juanito, the Suspicious Cat," in the Union League Club, Chicago; "Women of Taos," Santa Fé Railroad; "A Shrine to St. Anthony," in the collection of the Des Moines Association of Fine Arts; "Fiesta Day," at the Butler Art Institute, Youngstown, Ohio; "Pueblo of Taos" and "Indian at Stream" in the Los Angeles Museum. Examples of his murals are found in the decorations of the Englewood Theatre, Chicago.

HIGGS, HENRY (1864-). An English economist and administrator (see VOL. XI). His later writings include: *Financial System of The United Kingdom* (1914); *National Economy* (1917); *A Primer of National Finance* (1919).

HIGH PRESSURE BOILERS. See BOILERS.

HIGHWAYS. See ROADS AND PAVEMENTS.

HILDEBRAND, ADOLF E. R. (1847-1921). A German sculptor of prominence (see VOL. XI). His most important recent work has been the "Hubertus" Fountain at the National Museum in Munich (1921). At the time of his death he had finished the model for a monumental fountain for Cologne, with "Father Rhine" as the central figure.

HILDEBRAND, JOEL HENRY (1881-). An American chemist, born at Camden, N. J. He was graduated at the University of Pennsylvania in 1903, took his Ph.D. there in 1906, then studied for a year in Berlin. During

1904-05 he was assistant and during 1907-13 an instructor in chemistry at the University of Pennsylvania, after which he accepted a call to the University of California, where, in 1918, he became professor of chemistry. Physical chemistry, and such topics as electro-analysis, hydrogen electrodes, vapor pressures of metals and amalgams, dissociation of alcohol, and theories of solubility, are among those on which he has published the results of his studies. During the War he served as director of the laboratory of the Chemical Warfare Service in France with the rank of major and later commanded the gas defense school as lieutenant-colonel. He is the author of *Principles of Chemistry* (1917).

HILL, ALBERT ROSS (1869-). An American educator (see VOL. XI). From 1908, he was president of the University of Missouri. During the War, he was on a leave of absence until 1922 as director of foreign operations of the American Red Cross. In 1917, he was a member of the board of the United States Naval Academy.

HILL, ARCHIBALD V. (1886-). A British physiologist, educated at Cambridge and a fellow of Trinity College from 1910. He lectured on physical chemistry at the university from 1914 to 1919 and was then appointed professor of physiology at Manchester University, resigning in 1923 to become Jodrell professor of physiology in the University of London. During the War he was director of the Anti-Aircraft Station. With O. Meyerhoff, he shared the Nobel prize for medicine and physiology for 1921. Since 1910, he had been investigating the production of lactic acid by exercising muscle. His cosharer, Otto Meyerhoff, professor of physiology at the University of Kiel, was a personal friend of Hill and engaged in the same field of research.

HILL, DAVID JAYNE (1850-). An American diplomat and writer (see VOL. XI). In 1917 he was chairman of the War Finance Committee of the American Library Association. This committee raised over \$1,700,000 to erect library buildings at army camps and to provide reading matter for soldiers and sailors. His later writings include: *The People's Government* (1915); *Americanism—What It Is* (1916); *The Rebuilding of Europe* (1917); *Impressions of the Kaiser* (1918); *Present Problems in Foreign Policy* (1919); *American World Policies* (1920). He is president of the National Association of Constitutional Government.

HILL, EDWARD BURLINGAME (1872-). An American composer, born at Cambridge, Mass. After completing, with highest honors, all the courses in music under J. K. Paine at Harvard University, he continued his studies in Boston with B. J. Lang (piano) and F. F. Bullard (composition), and in New York with A. Whiting (piano) and H. E. Parkhurst (theory). In 1908, he was appointed instructor in music at Harvard and in 1918 was made assistant professor. He lectured extensively on modern French music, both in the United States and in France, and was also a frequent contributor to various periodicals. As a composer, his leaning is decidedly toward impressionism. His works include, two pantomimes, *Jack Frost in Midsummer*, and *Pan and the Star*; two symphonic poems, *The Parting of Lancelot and Guinevere*, and *The Fall of the House of Usher*; two orchestral suites, *Stevensoniana*

No. 1 and No. 2; *Nine Waltzes* for orchestra; *Poem* for violin and orchestra; *Prelude* to Euripides's *The Trojan Women*, and choruses, songs and pieces for piano

HILL, FRANK PIERCE (1855-). An American librarian (see VOL XI). In 1917, he was chairman of the American Library Association war finance committee which raised over \$1,700,000 for the purpose of erecting library buildings at army camps and providing books, newspapers and magazines for soldiers and sailors. He was also chairman of the Association's committee on enlarged programme in 1919.

HILL, JOSEPH ADNA (1860-). An American statistician (see VOL XI). After service as chief statistician of the United States Census he was appointed Assistant Director of the Census in 1921. He was the author of many census reports on child labor, the insane, divorce and kindred subjects.

HILL, LEONARD ERSKINE (1866-) See VOL XI. He published in two parts (1919-20) as a report to the Medical Research Commission *The Science of Ventilation and Open Air Treatment*; and in collaboration (Flack and Hill) *Textbook of Physiology* (1919). During the War, he was a member of the Medical Research Commission.

HILLER, KURT (1885-). A German writer. He was born in Berlin and studied at the universities of Berlin, Freiburg and Heidelberg, graduating as doctor of law. He is the author of: *Das Recht über sich selbst* (1908); *Die Weisheit der Langeweile* (1913); *Ein deutsches Herrenhaus* (1918); *Unnennbares Brudertum* (1918); *Geist werde Herr* (1920); *Logokratie* (1921); *Schmach des Jahrhunderts* (1922); and *Der Aufbruch zum Paradies* (1922). He also compiled the anthology *Der Kondor* and edited the posthumous works of Max Steiner.

HILLIS, NEWELL DWIGHT (1858-). An American clergyman and writer (see VOL XI). Among his later books are: *German Atrocities* (1918); *The Blot on the Kaiser's 'Scutcheon'* (1918); *Rebuilding the Ruined Lands of Europe* (1919); *The Better America Lectures* (1921).

HILLQUIT, MORRIS (1869-). An American Socialist (see VOL XI). He was the Socialist candidate for Mayor of New York City in 1917. In 1921, he published *From Marx to Lenin*.

HINDEMITH, PAUL (1895-). A German composer, born at Hanau, Hessen. He was a pupil of Hoch's Konservatorium, in Frankfurt, and in 1915 became concertmaster at the Frankfurt Opera. His first works, showing influences of Brahms, Reger and Mahler, attracted little attention, but when he had developed into an uncompromising futurist, he was hailed as a new Messiah throughout Germany. As for ugly and grotesque effects, his music appears as a caricature of the style of Stravinsky or Schönberg. His productivity has been enormous, especially in the field of chamber music (sonatas, string quartets, etc.). His three one-act operas, *Nusch-Nuschi* and *Hoffnung, Morder der Frauen* (Stuttgart, 1921) and *Sankta Susanna* (Frankfurt, 1922) were immediately suppressed by the police because of the alleged revolting immorality of the text.

HINDENBURG, PAUL VON BENECKENDORF UND VON (1847-). A German soldier born

in Posen. He entered the army in 1866, serving in the war against Austria, and in 1870-71 in the Franco-Prussian War. He was placed on the retired list in 1911, but when the World War broke out, and East Prussia was overrun by the Russians, he was recalled and given command of the VIII Army with General Ludendorff as his chief of staff. For his victories at Tannenberg, the Masurian Lakes, etc., he was made colonel-general and, later, field marshal. In November, 1914, he was given command of the armies of the East, later of the Austrian front, and in 1916 he succeeded Falkenhayn as chief of the general staff. By that time he was the national idol of the German people, and they erected an immense wooden statue of him in the Königsplatz in Berlin. Money was raised for war charities by charging a fee for the privilege of driving nails into the statue. After the War he was of great assistance in disbanding the armies. He published his recollections under the title *Aus meinem Leben* (1920).

HINDENBURG LINE. See WAR IN EUROPE, *Western Front*.

HINDHEDE, MIKKEL (?-). A Danish physician, an eminent authority on dietetics, who during the War was responsible for the nutrition of the Danish people. Known especially as a low protein advocate, he goes further in this direction than any other dietetic expert. Up to the outbreak of the War he was best known for two of his publications, *Protein and Nutrition* (1913) and *What to Eat and Why* (1914). These works are known through translations into English and German. His experiences in feeding the populace during the War were given out in 1920 in an official report of the Danish Minister of the Interior.

HINDS, ERNEST (1864-). An American military officer, born in Marshall County, Ala. He was graduated at the United States Military Academy in 1887, entered the army as second lieutenant in the 3d Artillery, and by successive promotions attained the rank of major-general on Dec 6, 1922. He participated in the war with Spain in Cuba and later saw duty in the Philippine Islands. During the War in Europe he was chief of artillery of the 1st Army Corps and then of the 1st Army in France, with the provisional rank of major-general. In 1919 he took command of the Field Artillery School of Fire at Fort Sill. For his "exceptionally meritorious and distinguished services" he received the United States Distinguished Service Medal and the decorations of the Legion of Honor from France, the Order of Leopold from Belgium, and the order of St. Maurice and St. Lazarus from Italy.

HINDUS. See BRITISH COLUMBIA.

HINES, FRANK THOMAS (1879-). An American soldier, born in Salt Lake City, and educated at the Agricultural College of Utah. He enlisted for the Spanish-American War. In 1919 he was commissioned second lieutenant in the Utah Light Artillery. He then joined the Regular Army, and rising through the various grades, became captain of the Coast Artillery Corps in 1908. He was made colonel of the National Army in 1918 and brigadier-general in the same year. In 1917 he was assigned to the office of the Chief of Staff as assistant in the Embarkation Service, which he headed in 1918. In 1919 he was appointed Chief of the Transportation Service of the United States

Army. He served at several important international conferences following the War. In 1923 he was appointed director of the Veterans' Bureau.

HINES, JOHN LEONARD (1868-). An American army officer, born in White Sulphur Springs, W. Va., and educated at the United States Military Academy. He was commissioned second lieutenant in 1888. He served during the Spanish-American War and in the Philippines and in the punitive expedition into Mexico in 1916-17. In the latter year he was appointed assistant adjutant-general in the American Expeditionary Forces and accompanied the first detachment of American troops to France. He was appointed colonel of the 16th Infantry in November, 1917, and in May, 1918, commanded the 1st Brigade Infantry, 1st Division. In October, 1918, he was appointed commander of the 3rd Army Corps, and in November, 1919, commander of the 4th Division. He commanded the 5th Division in 1920 and the 8th Corps Area in 1921. General Hines succeeded General Pershing as Chief of Staff of the United States Army in September, 1924.

HINES, WALKER DOWNER (1870-). An American lawyer and public official, born at Russellville, Ky., and educated at Ogden College and the University of Virginia. In 1893 he began the practice of law in Louisville and was general counsel of the Atchison, Topeka, and Santa Fé Railroad from 1906 to 1918 and was chairman of the Board of Directors of this road from 1916 to 1918. In 1906-16 he engaged in general law practice in New York. In the latter year he was appointed director general of railroads and served until 1920. In that year he was in Europe as arbitrator under the Peace Treaties of questions of river shipping. On his return to the United States in 1921 he resumed the practice of law. He is the author of numerous pamphlets and articles on railroad and governmental problems.

HINKSON, MRS. KATHARINE (maiden name TYNAN) (1861-). An Irish novelist and poet (see Vol. XI). Her later writings include: *The Story of Margery Dawe* (1915); *John-a-Dreams* (1916); *Miss Mary* (1917); *Herb o' Grace* (1918); *The Man from Australia* (1919); *Love of Brothers* (1919); *The Second Wife* (1920); *The Wandering Years* (1922); and *Mary Beadesert, V.S.* (1922).

HINSHAW, WILLIAM WADE (1867-). An American operatic baritone and impresario, born at Union, Iowa. While pursuing the general academic course at Valparaiso University (Ind.), he studied singing and theory with R. A. Heritage and later continued with L. G. Gottschalk and L. A. Phelps in Chicago. He made his debut on the concert stage in Chicago during the World's Fair (1893). From 1895 to 1899 he was dean of the Conservatory of Music at Valparaiso University. After coaching with A. Mareschalchi he was engaged for the Savage Grand Opera Company, and made his operatic debut as Mephistopheles in St. Louis (Nov. 6, 1899) with marked success. In 1903 he opened his own school of opera, which soon became merged with the Chicago Conservatory, and until 1907 he was president of the combined institutions. In 1909 he organized the International Grand Opera Company of Chicago, of which he was general manager, stage-manager, and principal baritone. From 1910 to 1913 he was a member of the Metropolitan Opera Com-

pany and then made guest appearances in various German opera houses. In 1918 he became president of the Society of American Singers, an organization devoted to the production of timate operas, especially Mozart's, in English. Since 1920 he has been directing his own chamber productions of opéra comique. He offered, 1916, a prize of \$1000 for a one-act opera by an American composer. It was awarded to H. Ley's *Bianca*, produced by the Society of American Singers, New York, 1917.

HINTON, EDWARD WILCOX (1868-). An American lawyer and educator, born in Rocheport, Mo., and educated at Christian College in Columbia, Mo., and at the University of Missouri, where he studied law. He began the practice of law at Columbia, Mo. He was professor of pleading and practice at the University of Missouri from 1903 to 1913 and for the latter year was professor of law at the University of Chicago. In 1918-19 he was a law dean of the law school of this University. He edited *Hinton's Cases of Trial Practice* (1915) and *Hinton's Cases on Evidence* (1914).

HINTZE, PAUL VON (1864-). A German admiral and diplomat, born at Schwel on-Oder. He served for several years as military attaché at several embassies and was military plenipotentiary to Russia in 1908. In 1914 he was in service in the German embassy in Mexico and in the same year was sent to China, where he carried on extensive propaganda in favor of Germany. He was transferred to Norway later in the same year. In 1918 he was appointed Secretary of State for Foreign Affairs and continued in this post until the fall of the empire.

HIROHITO, PRINCE (1901-). Prince Regent of Japan, proclaimed heir apparent in 1912 when his father became Emperor. He was educated under private tutors at the Imperial Education Institute in Tokyo, and when he reached the age of 18 he was given a seat in the House of Peers in the Imperial Diet. His father's ill health caused some of the imperial duties to devolve on the Prince in 1920, and early in 1921 there was a movement to have him declared Prince Regent. Instead, however, in the spring of that year he was sent on a visit to England, France, Belgium, and Italy, and was thus the first Japanese prince to leave his native land. He was royally entertained wherever he went. All hope of the Emperor's ability to continue his duties as ruler being abandoned, Prince Hirohito was designated Regent of Japan on Nov. 25, 1921. In December, 1923, a young student, inflamed by radical teachings, attempted to assassinate the young ruler. The whole nation was aroused, and the cabinet signed in a body as an expression of their horror, for the Prince was very popular because of his democratic ways. On Jan. 26, 1924, he was married to Princess Nagako, eldest daughter of Prince Kuni, with ancient Shinto rites.

HIRSCHFELD, GEORG (1873-). German author, at first chiefly a dramatist, and a prolific novelist (see Vol. XI). Among recent works are *Nachwelt* (1915), *Die Gebornen* (1916), *Die Deutsche Prinzessin* (1920), and *Das Haus mit der Pergola* (1923).

HIRSCHFELD, LUDWIG (1882-). Austrian writer, born at Vienna, and educated at technical schools. After drifting from one occupation to another, he settled down as a journalist. He was associate editor of

Wiener Neue Freie Presse and editor of the illustrated magazine, *Die Moderne Welt*. Hirschfeld is mainly a humorist but has written several comedies and texts for operettas, which include: *Der Wetterhahn* (1911); *Der Berühmte Gabriel* (1916); *Die Steinerne Maske* (1918); *Die Grosse Dummheit* (1919); *Der Liebling der Frauen* (1920); *Die Silberne Jugend* (1921), and he has also published *Die Klingende Stadt*, a volume of Viennese sketches (1912), *Wo Sind die Zeiten?* and *Ten Years of Viennese Life* (1920).

HIRSCHFELD, MAGNUS (1868-). A German psychiatrist, famous for his exhaustive studies in sex confusion and allied subjects. Born at Kolberg, he settled in Berlin to practice neurology and psychiatry in 1910, and within a few years he had published the following exhaustive works *Die Transvestiten*, 2 vols. (1910-12); *Die Homosexualität* (1914); *Sexual Pathologie*, 2 vols. (1917); and *Sexual Zwitterstufen* (1922).

HIRT, HERMANN (1865-). A German philologist (see VOL. XI). Among his recent works are *Geschichte der Deutschen Sprache*; *Fragen des Vokalismus und der Deutschen Stammbildung im Indogermanischen* (1914), and *Etymologie der Neuhochdeutschen Sprache* (1920).

HIRTH, FRIEDRICH (1845-1927). A German-American sinologue (see VOL. XI). He was professor of Chinese and head of the Chinese department of Columbia University, 1902-17. In 1917 he wrote *The Story of Chang K'ie'n, China's Pioneer in Western Asia*.

HISTOLOGY. See ZOOLOGY.

HISTORICAL ASSOCIATION, AMERICAN. A national organization founded in 1884 for the promotion of historical writing and studies in the United States. Throughout the decade 1914-24 it had its annual report published by the Smithsonian Institution, and brought out quarterly *The American Historical Review*. In 1915, after a controversy in which the *Review* was criticized, the Association gave the editors a vote of confidence and took the *Review* more closely under control. Woodrow Wilson was elected president for 1924 and after he died the first vice-president, Charles M. Andrews, became acting president.

HITCHCOCK, GILBERT MONELL (1859-). An American lawyer and public official. During the administration of President Wilson he was chairman of the Foreign Relations Committee of the Senate and led in the movement for the ratification of the League of Nations in that body, 1919-20. He was defeated for reelection in the Senate in 1922.

HITCHCOCK, HELEN SANBORN SARGENT (Mrs RIPLEY HITCHCOCK) (1870-). An American social worker, born at Elizabeth, N. J. She studied at the Art Students' League and in 1898 founded the Art Workers' Club for Women, of which she was president for 11 years. In 1914 she founded and was first vice-president of the Art Alliance of American Women. In 1917 she founded and was chairman of the Art War Relief and was vice-chairman of the American Jugo-Slav League. She took a prominent part also in other war activities. In 1914 she married Ripley Hitchcock of New York City.

HITLER, ADOLF (?-). Bavarian reactionary leader, born in Austria, but a naturalized Bavarian. In November, 1920, he organized

a movement in Bavaria similar to the Fascist movement in Italy. His followers wore gray shirts and brassards with an anti-Semitic Swastika cross in a white circular field on red. They were armed with blackjacks and, it was reported, with revolvers. Hitler had great gifts as an orator and organizer and stood for a strong united Germany. On Nov. 8, 1923, he and General von Ludendorff seized the government at Munich, but their power lasted only a few hours. Ludendorff was captured first; Hitler was taken on November 12. They were tried for treason in April, 1924, and Hitler was sentenced to a short term in the fortress at Landsberg, Bavaria.

HJARNE, HARALD GABRIEL (1848-1922). A Swedish historian. His last works were *Fran Forvansstriden* (1914), *Osteuropas Kriser och Sveriges Forsvar* (1914), *Mironskredstenismen* (1915), and *Var Ofverhangande Fara* (1917).

HOBAN, EDWARD FRANCIS (1878-). An American bishop, born at Chicago, and educated at St. Ignatius College, St. Mary's Seminary in Baltimore, and the Gregorian University at Rome. He was ordained priest in 1903. In 1908 he was appointed chancellor of the archdiocese of Chicago and was consecrated bishop of that diocese in November, 1921.

HOBART COLLEGE. An institution founded at Geneva, N. Y., under Episcopal auspices, in 1822. The number of students increased from 102 in 1914 to 209 in 1924, the number of teachers in the faculty from 21 to 32, and the library from 55,000 to 75,000 volumes. The productive funds rose from \$400,000 to \$800,000, of which \$200,000 was in scholarship foundations, and the endowment from \$600,000 to \$1,000,000, which was being added to in 1924 by payment on the endowment fund campaign pledges. Murray Bartlett succeeded Lyman Pierson Powell as president.

HOBHOUSE, LEONARD TRELAWNEY (1864-). A British sociologist and philosopher (see VOL. XI). He published in 1918 *A Philosophical Theory of the State*, a work in which he attacked the metaphysical absolutistic notions set up by the Hegelian school. He held that the habit of conceiving the state as a being led to political conservatism. *The Rational Good* (1921) is an attempt to treat ethics on a realistic and somewhat sociological basis. In addition to these works he was joint author, with G. C. Wheeler and Morris Ginsberg, of a survey of *The Material Culture and Social Institutions of the Simpler Peoples* (1915).

HOBHOUSE, MARTIN (1883-). A lecturer on history at the University of Berlin. He was born at Friesdorf and studied in Heidelberg, Munich, Freiburg, Berlin, and Göttingen. He was lecturer at the University of Kiel in 1913 and in Berlin in 1914. In 1916 he founded a bureau for the repression of chauvinism. He became very active in political life. His principal works include: *Macchiavellis Renaissance- und Kriegskunst* (1912); *Torstensson als Vorgänger Friedrichs des Grossen* (1913); *Die Alldeutsche Bewegung; eine Politische Schuld und Gefahr* (1915); *Vaterlandspolitik* (1917); *Wir Brauchen Kolonien* (1918); *Chauvinismus und Weltkrieg* (1919); and *Delbruck, Clausewitz, Kritik des Weltkriegs* (1920).

HOBSON, JOHN ATKINSON (1858-). An English economist (see VOL. XI). His later writings include: *Towards International Gov-*

ernment (1915); *The New Protectionism* (1916); *Democracy after the War* (1917); *Richard Cobden: the International Man* (1918); *Taxation in the New State* (1919), *Problems of a New World* (1921); *Incentives in the New Industrial Order*; and *Economics of Unemployment* (1922).

HOBSON, RICHMOND PEARSON (1870-). An American naval constructor, lecturer, and author (see VOL. XI). Among his later books are *Destroying the Great Destroyer* (1915); *America and the World War* (1917); *The Great Reform* (1918); *Alcohol and the Human Race for Truth Inoculation of Society* (1919). In 1921 he organized the American Alcohol Educational Association.

HOCHENEGG, JULIUS VON (1859-). An Austrian surgeon, known as the world's leading operator for cancer of the rectum. Having obtained his medical degree from the University of Vienna in 1885, he became an assistant to Professor Albert and in 1889 a private docent in surgery. From 1891 to 1904 he had a class in surgery in the Poliklinik of the University, after which he was made full professor of surgery with charge of the University Surgical Clinic. He has published but few books, in 1906 he edited *Lehrbuch der Speziellen Chirurgie* (2 vols.), which was reissued in 1918. His military experiences were summed up in his *Kriegschirurgische Mitteilungen* in 1919. From time to time he has reported his experiences with rectal cancer in the Vienna medical journals.

HOCHSTETTER, GUSTAV (1873-). A German writer. He was born at Mannheim and studied in Heidelberg and Berlin. A humorist, he edited the popular humorous magazine, *Die Lustigen Blätter*. He is the author of *Das Starre System* (1908); *Diskretion Ehrensache* (1909); *Der Tausendste* (1909); *Das Fusschen der Gnadigen Frau* (1912); *Die Heiratsjagd* (1912); *Hundert Frauen* (1913); *Wir Sind Wir* (1914); *Bismarcks Historische Karrikaturen* (1914); *Das Morse Alphabet* (1915); *Debbitzer Briefe* (1916); *Lachende Geschichten* (1917); *Das Buch der Liebe* (1917); *Venus in Seide* (1920); and *Das Lustige Hundebuch* (1920).

HOCK, STEFAN (1877-). An Austrian writer, born at Vienna, and educated in Vienna and Berlin. He was connected with the famous Burgtheater and was lecturer at the State Academy for music and drama. He is the author of *Die Fampyrage* (1901); *Der Traum: ein Leben* (1904); a history of German literature for grammar schools (1913); an introduction to the study of Grillparzer (1909); a monograph on *Paul Schlenker* (1909); *Die Romantische Schule in Deutschland* (1910); *Karl May* (1912); *Friedrich Hebbel* (1913); *Gerhart Hauptmanns Odysseus* (1914); and *Prinz Eugen, der Edle Ritter* (1918). He compiled an anthology of Austrian verse, wrote a treatise entitled *Giebt es eine Oesterreichische Literaturgeschichte?* and edited the correspondence of Betty Paoli and Leopold Kompert.

HOCKER, PAUL OSKAR (1865-). A popular German novelist, publisher of the magazine *Velhagen und Klasing's Monatshefte*. He was born at Meiningen, had a university education and studied at the Royal Academy of Music in Berlin. Included among his numerous works are: *Fräulein Doktor* (1897); *Die Frau Rat* (1898); *Weisse Seele* (1901); *Letzter Flirt* (1902); *Frühlingstürme* (1904); *Don Juans*

Frau (1906); *Die Verbotene Frucht* (1908); *Die Sonne von St. Moritz* (1910); *Die Lachende Maske* (1911); *Die Meisterin von Europa* (1913); *Ein Liller Roman* (1916); *Die Stadt in Ketten* (1917); and other fiction. He also wrote a volume of war sketches, recollections of his youth, and two plays, *Die Wappenhanse* (1904) and *Das Volk in Waffen* (1913).

HOCKEY. See SPORTS.

HOCKING, JOSEPH (1860-). An English clergyman and novelist (see VOL. XI). His later writings include: *The Day of Judgment* (1915); *The Path of Glory and Tommy and the Maid of Athens* (1917); *The Pomp of Yesterday and The Price of a Throne* (1918); and *In the Sweat of Thy Brow* (1920).

HOCKING, SILAS KITTO (1850-). An English novelist (see VOL. XI). His later writings include: *The Beautiful Alien* (1916); *His Own Accuser* (1917); *Nancy* (1919); *Watchers in the Dawn* (1920); *The Greater Good* (1922); and *My Book of Memory* (1923).

HOCKING, WILLIAM ERNEST (1873-). An American philosopher, born at Cleveland, Ohio, and educated at Harvard University. He was instructor in the history and philosophy of religions at Andover Theological Seminary (1904-06). After 1906 he taught philosophy successively at California, Yale, and Harvard Universities. He was appointed to the Alford professorship at Harvard in 1920. He is the author of two important works on religion and ethics, *The Meaning of God in Human Experience* (1912) and *Human Nature and Its Remaking* (1918; rev. ed., 1924). During the War he gave a series of lectures on *Morale and Its Enemies* (1918).

HODGE, JOHN (1855-). A British labor leader, born in Scotland. He founded and was president of the Iron and Steel Trades Confederation and took an active part in the political, municipal, and industrial movements of Glasgow and western Scotland. He removed to Manchester and was for several terms a member of the City Council. In 1906 he was elected to Parliament and was acting chairman of the Labor party in the House of Commons in 1915. He served on several important commissions and was Minister for Labor in 1916-17 and Minister for Pensions in 1917-19. He took an active part in the temperance movement.

HODGES, HARRY FOOTE (1860-). An American army officer, born at Boston, Mass. He graduated from the United States Military Academy in 1881, when he was made second lieutenant in the engineers. He continued in the army until December, 1921, when he was retired with the rank of major-general. His services have been chiefly with engineering work, at first on river and harbor duty, and then at the Military Academy as assistant professor of engineering. In 1907 he became assistant chief engineer and a member of the Isthmian Canal Commission. Continuing in this position until 1915, he had much to do with the designing of the locks and dams and other regulating work on the Panama Canal, for which he received the thanks of Congress. During the War he had command of Camps Devens (Mass.), Sevier (S. C.), and Travis (Tex.). He was also in France in command of the 20th Division. Later he was in command of the North Pacific and 3d Coast Artillery districts until his retirement. He received the United States Distinguished Service Medal.

HOEBER, KARL (1867-). A German pedagogue and editor of the *Kölnische Volkszeitung*, born at Dietz and educated at the universities of Freiburg, Heidelberg, and Strassburg. He taught in various colleges and was director of the teachers' seminary in Metz. He is the author of *F. W. Weber, Leben und Dichtung* (1903); *Edmund Hardy, ein Lebensbild* (1905); *Sprachgebrauch im Volksheld des vierzehnten und fünfzehnten Jahrhunderts* (1908); *Das Deutsche Universitäts- und Hochschulwesen* (1912); *Die Religiösen Pflichten des Gebildeten Laienstandes* (1913); *Religion, Wissenschaft, Freundschaft* (1921); and *Pro Deo et Patria* (1921).

HOENSBROECH, PAUL, COUNT (1852-1923). A German theologian and writer on history and allied subjects (see Vol. XI). His later works include: *Zwei Welten: Dramatische Bilder* (1918); *Graf Hertling, Reichskanzler* (1918); *Ein Stück Jesuitenmoral* (1918); *Wilhelm II, Abdankung und Flucht* (1918), and *Zurück zur Monarchie* (1918). He died Sept. 9, 1923.

HOFFDING, HARALD (1843-). A Danish philosopher (see Vol. XI). Despite advancing age, he published several philosophic works after 1914. In 1921 he helped organize the *Societas Spinozana*, an international body for the study and interpretation of the works of the great Dutch philosopher. Professor Hoffding's writings include: *Modern Philosophers* (1915); *The Great Humor* (1916); *The Concept of Totality* (1917, 1918); *Spinoza's Ethics* (1918); *Life and Interpretation* (1918); *Leading Conceptions of the Nineteenth Century* (1920); and *The Concept of Relation* (1921, 1922).

HOFFMAN, FREDERICK LUDWIG (1865-). An American statistician (see Vol. XI). Among his later books are: *Industrial Accident Statistics* (1915); *Mortality from Cancer throughout the World* (1915); *A Plea and a Plan for the Eradication of Malaria throughout the Western Hemisphere* (1916); *National Health Insurance in Great Britain* (1920); *Race Amalgamation in Hawaii* (1921); *Health Conservation and Vital Statistics of South American Republics* (1921).

HÖFFNER, W. F. JOHANNES (1886-). A German clergyman and writer, born at Dramburg. He studied theology at Halle and Berlin. After some years as a pastor, he became editor of the popular magazine *Daheim*, a position which he filled until 1921. He is the author of *Pastorentheologie in Beispielen* (1906); *Der Sinn des Lebens*, a volume of stories (1909); *Frau Rat* (1910); *Der Scharfe Weinberg* (1909); *Elisabeth Goethe, geb. Teator* (1910); *Der Verslossene Garten*, a novel (1910); *Misericordia* (1911); *Gideon der Arzt* (1911); *Die Treue von Pommern* (1912); *Aus Biedermeiertagen* (1912); *Schiller* (1913); *O du Heimatstufur* (1916); and a biography of Goethe (1920).

HOFFMANN, JOSEF (1877-). A celebrated Polish pianist (see Vol. XI). In 1916 he featured on his recital programmes works by an entirely unknown composer, Michel Dvorsky, which attracted favorable comment. He also played two concertos for piano and orchestra by Dvorsky, *Chromaticon* and a concerto in A♭, and the Philadelphia Orchestra produced the same composer's symphonic poem, *Le Château Hanté*. A rumor began to circulate that Dvorsky was really Hoffmann. No one

could get into communication with the supposed Dvorsky. Hoffmann himself declared that the composer had studied in Paris and was living in strict seclusion at San Sebastian, Spain. The mystery was cleared up on Dec. 28, 1923, when Stokowski gave an all-Hoffmann programme, with Hoffmann as soloist, which included all the compositions mentioned. This programme was repeated in New York a few days later. Hoffmann's explanation was that he wished to secure an impartial opinion regarding the public's valuation of his works, an object which could not have been realized had the works been introduced under the composer's real name.

HOFFMANNSTHAL, HUGO VON (1874-). An Austrian author whose dramas make him an outstanding figure in contemporary German literature (see Vol. XI). He published after 1914: *Prinz Eugen, der Edle Ritter* (1915); *Alkestis* (1916); *Rodauner Nachklänge* (1920); *Der Tod des Tizian* (1920); *Der Schmied* (1921); *Die Frau ohne Schatten* (1921), and other works. The last named and others of his plays served Richard Strauss as librettos for his operas.

HOLBROOK, ELMER ALLEN (1880-). An American mining engineer and public official, born at Fitchburg, Mass., and educated at the Massachusetts Institute of Technology. He served as engineer and superintendent of several mines. In 1911-12 he was professor of mining at the Nova Scotia Technical College and after 1917 was associated with the United States Bureau of Mines in various capacities. He is the author of many articles on mining and engineering.

HOLBROOK, WILLARD AMES (1860-). An American army officer, born in Arkansas, Wis. He graduated from the United States Military Academy in 1885 and became second lieutenant in the First Cavalry. Continuing in the army, he became in 1920, after successive promotions, chief of cavalry, with the rank of major-general. General Holbrook was also an honor graduate of the Infantry and Cavalry School in 1891 and of the Army War College in 1912. His services have included duty in Cuba during the war with Spain, in the campaigns in the Philippines, at the Pennsylvania Military Academy, and on the Mexican border. During the War in Europe he was overseas, where he held the provisional rank of major-general in the National Army. On his return to the United States he was made chief of staff of the Southern Department; he later became chief of cavalry. His services won him the United States Distinguished Service Medal.

HOLDEN, CHARLES ARTHUR (1872-). An American educator, born at Hudson, Mass., and educated at the Thayer School of Civil Engineering of Dartmouth College and at Harvard. During 1895-98 he was engaged in construction work on the Boston and Albany Railroad, after which for two years he was an instructor at the Worcester Polytechnic. In 1901 he returned to the Thayer School where, in 1908, he became professor of civil engineering, and in 1919, director. During 1901 he also lectured on civil engineering at the University of Wisconsin. Professor Holden has been able to

give attention professionally to important engineering enterprises, notably as engineer for New Hampshire in the New Hampshire and Vermont boundary litigation; he has been frequently called into court as an expert. During the War he was executive secretary of the emergency help and equipment commission of New Hampshire and supervisor of military training at Dartmouth.

HOLDEN, HALE. See RAILWAYS, Consolidations.

HOLDICH, SIR THOMAS HUNGERFORD (1843-). An English explorer (see VOL. XI). He was president of the Royal Geographical Society from 1916 to 1918. His later publications include *Political Frontiers and Political Boundary Making* (1916) and *Boundaries in Europe and the Near East* (1918).

HOLITSCHER, ARTHUR (1869-). An Austrian writer, born at Budapest. He engaged in the banking business in Fiume, traveled in Europe and America, and took up his residence in Berlin. He is the author of novels and short stories, among them: *Leidende Menschen* (1893); *Weisse Liebe* (1896); *Das Sentimentale Abenteuer* (1905); *Der Vergiftete Brunnen* (1900); *Der Golem* (1909); *Worauf wartest Du?* (1910); *Bruder Wurm* (1910); *Schlafwandler* (1919), and *Adele Boukes Begegnung* (1920). He also wrote a play, *Das Andere Ufer* (1901); some essays, *Ideale des Alltags* (1920), and books of travel, *Amerika Heut und Morgen* (1912), *Geschichten Zweier Welten* (1920), *Ost Suduest* (1915), *Das Amerikanische Gesicht* (1918), and *Drei Monate in Soviet Russland* (1921). He translated Oscar Wilde's *Ballad of Reading Gaol*.

HOLL, KARL (1866-). A German Protestant theologian, and professor at the university of Berlin (see VOL. XI). Like many other German writers, after the War he turned to Luther for spiritual guidance. He published *Die Bedeutung des Grossen Krieges für das Religiöse und Kirchliche Leben der Protestanten* (1917); *Was verstand Luther unter Religion?* (1917); *Luther und Calvin* (1919).

HOLLAND. See NETHERLANDS.

HOLLAND, CLIFFORD MILBURN (1883-1924). An American civil engineer, born at Somerset, Mass. He studied at Harvard. His professional work has been chiefly under the New York State Public Service Commission. In 1906-09 he was assistant engineer in the building of the Joralemon Street tunnel under the East River, and in 1906-12, with the Fourth Avenue subway. Subsequent to 1916 he continued this service as division engineer in charge of all tunnels built under the East River. He later became chief engineer of the New York State Bridge and Tunnel Commission and of the New Jersey Interstate Bridge and Tunnel Commission, directing construction of the bridge and tunnel connecting New York and New Jersey.

HOLLAND, RUPERT SARGENT (1878-). An American lawyer and writer, born at Louisville, Ky. He graduated from Harvard in 1900 and from the Law Department of the University of Pennsylvania in 1903. In the same year he was admitted to the bar. He was chief attorney for the Legal Aid Society of Philadelphia from 1904 to 1910 and lectured also for the American Society for the Extension of University Teaching. He was well known as a writer of historical works and fiction. Among his works are

Builders of United Italy (1908); *Historical Inventions* (1911), *Historical Events of Colonial Days* (1916), *The Blue Heron's Feather* (1917), and *The Paneled Room* (1921).

HOLLANDER, JACOB HARRY (1871-). An American economist (see VOL. XI). His later writings include *The Abolition of Poverty* (1914) and *War Borrowing* (1919).

HOLLINGWORTH, HARRY LEVI (1880-). An American experimental psychologist, born at DeWitt, Neb., and educated at Columbia University. In 1909 he was appointed instructor of psychology at that institution, and in 1916 he became associate professor. He was one of the leaders in the movement for industrial application of scientific psychology. His principal works are *Studies in Judgment* (1913); *Outline for Experimental Psychology* (1914); *Outlines for Applied and Abnormal Psychology* (1914); *Advertising, Its Principles and Practice* (1915), *Vocational Psychology* (1916); *Science of Taste* (1917); *Applied Psychology* (1917); and *Psychology of Functional Neuroses* (1920).

HOLLIS, HENRY FRENCH (1869-). An American public official (see VOL. IX). He served in the United States Senate from 1913 to 1919 and during the War did relief work in Poland and Siberia. He was decorated by these governments for his services.

HOLLIS, WILLIAM STANLEY (1866-). An American public official, born in Chelsea, Mass. He studied at the United States Naval Academy in 1883-84 and left on account of a gun accident. He served in several capacities in the consular service from 1889 to 1911, when he was appointed consul general of Beirut, Syria. On the entrance of Turkey in the War, he had charge of the interests of the Allies in Syria. He was also head of the American Red Cross in Beirut and was prominent in relief work in Syria and elsewhere. He served as consul general in London in 1919 and during other periods and was a representative in London of the United States War Trade Board and other important bodies. In 1920 he was appointed consul general at Lisbon, Portugal.

HOLLISTER, NED (1876-). An American zoölogist, born at Delaware, Wis. He collected extensively in field zoölogy throughout the western part of the United States (1902-09) and was then assistant curator of mammals at the United States National Museum (1910-16) and superintendent of the National Zoölogical Park (1916-). He published *Birds of Wisconsin* (1903); *Systematic Synopses of Muskrats* (1911), *Mammals of the Philippine Islands* (1912), *Mammals of Alpine Club Expedition to Mt. Robson* (1913); *Philippine Land Mammals in the United States National Museum* (1913); *A Systematic Account of the Grasshopper Lice* (1914); and *East African Mammals in the United States National Museum* (1918, 1919).

HOLM, FRITZ (VILHELM) (1881-). A Danish explorer, born at Copenhagen, and educated at Copenhagen University and in the Danish Royal Navy. After serving in the navy from the time he was fourteen years of age until he was 19, he went to the Far East, acting as journalist and in other positions until 1904, when he visited the United States. In 1905 he was engaged in journalistic work in London, and in 1906 he commanded a scientific mission

into the interior of China, the result of which was the bringing to the western world of the only existing monolithic replica of the famous Nestorian Monument of A.D. 781, which was lent to the Metropolitan Museum of Art in New York, 1908-16. This replica is now in the Lateran Palace in Rome, Italy. He was very active in the War as correspondent and as Red Cross Commissioner and received many decorations for his work.

HOLM, GUSTAV FREDERICK (1849-). A Danish explorer, who published a number of works on Greenland (see Vol. XI). An English translation of *Legends and Tales from Augmasalik* appeared in 1914.

HOLMES, HARRY NICHOLLS (1879-). An American chemist, born at Fay, Pa., and educated at Westminster College and Johns Hopkins University. During 1906-07 he was an assistant in chemistry at Johns Hopkins and then became professor of chemistry at Earlham College until 1914, when he was called to a similar chair at Oberlin College and was made head of the department. Dr. Holmes is a specialist in the chemistry of soaps and in colloid chemistry, in consequence of which he became the chairman of the subcommittee on colloid chemistry of the National Research Council in 1919-22. The results of his studies on the specialties which he has made his own have been published in papers contributed to the American Chemical Society of which he is a member and of whose division of physical and inorganic chemistry he was chairman in 1920. He is the author of an *Outline of Qualitative Analysis* (1908), *Laboratory Manual of General Chemistry* (1909), *General Chemistry* (1921), and *Laboratory Manual of Colloid Chemistry* (1921).

HOLMES, JOHN HAYNES (1879-). An American clergyman (see Vol. XI). He was chairman of the General Unitarian Conference from 1915 to 1917, was president of the Free Religious Association from 1914 to 1919, and was made director of the Civil Liberties Bureau in 1917. He broke from Unitarianism and became an independent in 1919. His later writings include: *Is Death the End?* (1915); *New Wars for Old* (1916); *Religion for To-day* (1917); *The Life and Letters of Robert Collyer* (1917); *Readings from Great Authors* (1918); *The Grail of Life* (1919); and *Is Violence the Way Out?* (1920).

HOLMES, SAMUEL JACKSON (1868-). An American zoologist, born at Henry, Ill. He was educated at the University of California and the University of Chicago (Ph.D., 1897). He was instructor in zoology at the University of Michigan (1899-1905), associate professor there (1905-11), and associate professor (1911-16) and professor (1916-) at the University of California. He published *Biology of the Frog* (1906); *Evolution of Animal Intelligence* (1911); *Studies in Animal Behavior* (1916); *Elements of Animal Biology* (1918); *The Trend of the Race* (1921); and *A Bibliography of Eugenics* (1924).

HOLMES, WILLIAM HENRY (1846-). An American anthropologist (see Vol. XI). He was curator of the department of anthropology at the Field Museum in Chicago, of the department of aboriginal pottery at the National Museum in Washington, and of the National Art Gallery of Washington (1910-20). He has published many works on archæological and anthropological subjects. His most recent publica-

tion is *Handbook of Aboriginal American Antiquities* (1918).

HOLSCHER, GUSTAV (1877-). A German theologian and authority on the Old Testament. He was born at Norden and studied at the universities of Berlin, Munich, and Leipzig. In 1893 he made a journey to Palestine and Phœnicia under the auspices of the German Orient Society. He lectured at the universities of Halle, Göttingen, and Giessen (1904-20) and in 1921 became professor of Old Testament science at Marburg. He is the author of *Palästina in Persischen und Hellenischen Zeiten* (1903), *Quellen des Josephus* (1904), *Sadduzäismus* (1906); *Landes- und Volkskunde Palästinas* (1908), *Two Greek Inscriptions from Khurbet Harrau* (1909), *Geschichte der Juden in Palästina von Siebzug nach Christus* (1910); *Propheten* (1915), *Entstehungszeit der Himmelfahrt Moses* (1919); *Entstehungszeit des Buches Daniel* (1920); and a work on the meter of Arab, Sumnerian, and Hebrew poetry.

HOLST, GUSTAV (1874-). An English composer, born at Cheltenham. He studied at the Royal Academy of Music under Stanford and Parry, then played for some seasons in various orchestras, and finally settled in London as a teacher. In 1907 he became director of music at Morley College and also at St. Paul's Girls' School. In May, 1923, he conducted several of his works at the Ann Arbor (Mich.) Festival. His works include four operas, *The Revoke* and *The Youth's Choice* (neither of them produced), *Savitri* (London, 1916), and *The Perfect Fool* (ib., 1923); a masque, *The Vision of Dame Christian*, a symphony, *Cotswolds*; an overture, *Walt Whitman*; the orchestral suites, *Beni Mora*, *Phantastes*, *The Planets*, and *Japanese*; a symphonic poem, *Indra*; a *Fugal Concerto* for flute and oboe with string orchestra; *The Mystic Trumpeter* for soprano and orchestra; *Ornutt's Drapa* for baritone and orchestra; the choral works with orchestra, *Clear and Cool*, *King Estmere*, *Choral Hymns from the Rig Veda*, *The Cloud Messenger*, *Christmas Day*, *Hecuba's Lament*, *Hymn to Dionysus*, *The Hymn of Jesus*, *Ode to Death*; and chamber music, songs and part songs.

HOLT, EDWIN BISSEL (1873-). An American psychologist and philosopher, born at Winchester, Mass., and educated at Harvard and Columbia Universities. He was instructor in psychology at Harvard University, 1901-05; assistant professor, 1905-18. His two important works, *The Concept of Consciousness* (1914) and *The Freudian Wish* (1915), combine the approach of behavioristic psychology with a realistic metaphysics. Professor Holt was one of the group of six who published a joint profession of neo-realistic doctrine (1912). His own contribution to that philosophy included the notion of neutral entities; that is, entities neither mental nor physical, which he presumed to be the ultimate elements of the universe.

HOLT, HAMILTON (1872-). An American editor (see Vol. XI). In 1917 he was special lecturer for the World Peace Foundation, and the Isaac Bromley lecturer on journalism at Yale University. In the spring of 1918 he visited the Allied battle fronts as guest of the British, French, American, Belgian, and Italian governments and represented the League to Enforce Peace at the Peace Conference at Versailles in 1919.

HOLT, HENRY (1840-1926). An American

author and publisher (see VOL. XI). In 1915 he became a member of the Harvard Overseers Visiting Committee on philosophy and psychology. From 1914 to 1921 he edited *The Unpartisan Review* (formerly *The Unpopular Review*) and in 1919 he published *The Cosmic Relations and Immortality*.

HOLT, LUCIUS HUDSON (1881-). An American author, born in Atchison, Kan., and educated at Yale. He was instructor in English there from 1905 to 1908 and assistant editor of *Webster's International Dictionary* from 1908 to 1910. From 1910 he was professor of English and history at the United States Military Academy. He was a member of several societies and wrote *Introduction to the Study of Government* (1914), *Leading English Poets* (1915), *History of Europe, 1862-1914*, with A. W. Chilton (1917); *Brief History of Europe 1789-1915*, with A. W. Chilton (1918), and *Military Correspondence, Reports and Orders* (1918).

HOLT, L(UTHER) EMMET (1855-1924). An American physician (see VOL. XI). Dr. Holt's death occurred suddenly in China, where he had gone to deliver a course of lectures on pediatrics in the new medical college established at Peking by the Rockefeller Foundation. The only considerable recent work published by him is *Food, Health, and Growth* (1922). The Holt treatise on pediatrics was reissued in 1922 under the joint authorship of Holt and Howland of Johns Hopkins University. Dr. Holt was recognized as one of the great medical figures of his day, notably in the field of pediatrics. His popular booklet on the feeding and care of infants was translated into many languages.

HOLT, WINIFRED (?-). An American sculptor and philanthropist, born in New York City. She was educated privately and studied anatomy, drawing, and sculpture in Florence. Her works, exhibited in New York and in several cities of Europe, included portraits, busts, and bas-reliefs. She founded and was secretary of the Association for the Blind, and through her efforts several homes for the blind were founded. She also organized so-called light-houses for the blind in France and other parts of Europe. In 1921 she visited Poland as a guest of the Polish Government for the relief of the Polish blind. During the War she did much relief work among those blinded in battle. She was awarded medals by France and other governments and was the author of *A Short Life of Henry Fawcett* (1911), *The Beacon for the Blind* (1914), and numerous papers.

HOLY PLACES. See ARABIA.

HOLZKNECHT, GUIDO (1872-). An Austrian physician, pioneer in röntgenology, who has recently attracted much attention through his attempts to "rejuvenate" elderly women by raying the genital glands. Holz-knecht is indirectly responsible for Gertrude Atherton's novel, *Black Owen*. Having received his medical degree from the University of Vienna, just as the Röntgen rays were coming into use in medicine, he began to devote himself to this subject and was eventually appointed professor of radiology in the university. He published the results of X-ray diagnosis in tuberculosis and diseases of the chest in 1901 in a volume entitled *Die Röntgenologische Diagnostik der Erkrankungen der Brusteingeweide*. In collaboration (Holzknecht and Jonas) he wrote *Die Radiologische Diagnostik der Intra- und Extraventriculären Tumoren* (1908), and

in 1921 he edited the large two-volume work, *Röntgenologie*.

HOME RULE, MUNICIPAL. See MUNICIPAL GOVERNMENT.

HONDURAS. A Central American republic with an area of about 44,275 square miles, and a population, on Jan. 1, 1922, of 662,422 (a gain of 17 per cent over the last decennial census). The capital, Tegucigalpa, had 38,950 in 1920. Other important towns are: La Esperanza (11,453), Santa Rosa (10,574), Nacaome (8152), Choluteca (8065), Amapala (2800), La Ceiba (8000), Puerto Cortés (4000). The percentage of illiteracy among children was 56 per cent and school attendance increased only slightly over 1911. By the school census of 1919 only 35,912 children out of the 87,207, were receiving instruction.

Industry. The cultivation of bananas and coconuts continued as the leading activity. For the year ending Dec. 31, 1922, 12,520,495 bunches of bananas were exported, and 10,056,977 coconuts. Exports of both bananas and coconuts declined for 1923, banana shipments to the United States (over 99 per cent) being 10,725,004 bunches, and coconuts 7,485,519. The coffee production remained stationary while that of rubber decreased. Cattle and horse raising was on the decrease, there being 500,000 heads in 1920, compared with 800,000 in 1922. After 1912 the country's trade consistently made gains, the imports being \$14,342,237 in 1922-23 as compared with \$5,132,679 in 1912-13, and the exports in 1922-23, \$10,016,270 as compared with \$3,180,968 in 1912-13. The United States supplied 85 per cent of the goods imported into the country in 1922-23, and took 90 per cent of its exports. The balance of trade was overwhelmingly against Honduras.

Finance. For the year 1922-23, the budget estimates balanced at 7,949,032 pesos. (In 1913-14, this was 4,824,000.) The national budget appropriations steadily increased after 1913-14, while both revenues and expenses were always larger than the budgeted amounts. The 1921-22 budget called for revenues and expenses of 6,674,895 pesos, but revenues were actually 7,386,979 pesos and expenses 7,196,161 pesos, showing a surplus of 190,818 pesos. The interest arrears on the foreign debt were not being paid with the result that the foreign debt totaled \$125,000,000 in 1923. The internal debt in 1921 amounted to over \$6,000,000, United States currency. In 1922, the Banco de Honduras became the national bank of issue. In 1918, the peso was legally fixed at one-half the value of the American dollar. In 1920, an ambitious programme of fiscal reform was launched under the direction of an American expert, but it was not carried out because of lack of funds, while the years 1922, 1923, and part of 1924, were years of political disturbances, which made expenditures for war out of all proportion to other expenses, and created huge deficits. In 1920 the national railway of 95 kilometers was turned over to Compañía Agrícola de Sula to secure a credit of \$1,000,000 to be used in the complete reconstruction of the road. This Compañía Agrícola, a subsidiary of the American Fruit Company, was changed in 1924 to the Cortes Development Company, and retained control over the national railroad. Slightly over 500 miles of railways, in addition to the national line, were the property of American fruit companies operat-

ing on the north coast. There were no railways on the Pacific coast. There were about 200 miles of highways open the year around to wheeled traffic. A national coast-to-coast highway, which was to have been opened in 1924 (385 kilometers in length), was damaged during the revolutions.

History. Internal affairs were stormy during the period 1914-24. In 1919, President Bertrand's well prepared plans for his own reelection were upset by a revolt led by General Gutierrez. Bertrand fled the country; Gutierrez had himself declared dictator; and, in October, 1919, was elected president. In 1920, disturbances were again reported with the result that United States battleships had to proceed to the scene to protect American property. In 1923, on the eve of the forthcoming election, civil war again threatened and many prominent Hondurans sought safety in flight. After a contest, in which bloodshed and violence were not wanting, and which was marked by the continuous interference of the president, General Carias, Conservative candidate, received a plurality vote. The election was now thrown into the Congress which, in 1924, declared it could find for no one candidate. The usual round was now repeated. American marines were rushed to the scene but could effect nothing; the president, Gutierrez, proclaimed himself dictator, Feb. 1, 1924; the disappointed presidential aspirants took up arms in rebellion and waged war intermittently on each other throughout February. In March, Gutierrez was put to flight, and, after a chaotic interregnum, Dr. Fausto Davilla, Conservative, was proclaimed provisional president by a group of revolutionary "generals"; but the forces defending Tegucigalpa set up a rival in the person of Zuñiga Hueta. In the hope of restoring order, President Coolidge sent Mr. Sumner Welles as his special representative, in April, to mediate, and the four neighboring republics were invited to join in a conference with the warring Honduran factions. This somewhat unusual procedure met with success early in May, when one of the revolutionary chieftains, Gen. Vicente Tosca, was elected president and the civil war was ended.

The government applied itself toward furthering the union of Central American States, and with Guatemala and Salvador signed a pact in 1921 for common action in matters of trade, communications, and coinage. In 1919, Guatemala and Honduras submitted their long outstanding boundary dispute to the United States Secretary of State and a scientific survey under the administration of the American Geographical Society was provided for. A further advance toward realizing peace in Central America was made in 1922 at a conference of the presidents of Nicaragua, Salvador, and Honduras on board the U.S.S. *Tacoma* in Fonseca Bay (Aug. 20, 1922), at which the three countries reaffirmed in part the Treaty of Peace and Friendship of Dec. 20, 1907 (see CENTRAL AMERICAN UNION). On July 19, 1918, Honduras declared war on Germany and thus became an Associate Power and original member of the League of Nations. On Nov. 15, 1922, however, Honduras notified the League of its intention to withdraw because of the onerous annual dues.

HONEGGER, ARTHUR (1892-). A French composer, born at Havre. He studied

in Zurich, 1907-09, and then with R. Martins in Havre and L. Capet in Paris, where he lived after 1913. He began as an extreme futurist and was soon recognized as the leader of the notorious group, "Les Six" (Auric, Durey, Milhaud, Poulenc, and Taillefer). His works comprise an opera, *La Mort de Ste.-Alm  enne*; incidental music to Morax' *Le Roi David* and M  ral's *Dit des Jeux du Monde*, a ballet, *V  rit  ? Mensonge?*; a symphonic poem, *Pastorale d'Et  *; a mimic symphony, *Horace Victorieux*; *Rhapsodie* for piano, flutes, and clarinet; chamber music; and songs.

HOOVER, BRIAN (WILLIAM BRIAN) (1880-). An American author (see Vol. XI). In 1915 he was awarded the prize in an America Opera Association competition for the opera *Fairyland*, with music by Horatio Parker. In the same year he published another opera, *Morten and the Grail*, and a commemorative poem, *A.D. 1919*, also with music by Horatio Parker, and a volume of *Poems*, 1915. He became literary editor of the *New York Sun* in 1917.

HOOVER, C(HARLES) R(UGLAS) (1885-). An American chemist, born in Oskaloosa, Iowa, and educated at Haverford College and Harvard University, where he held a Carnegie fellowship, 1912-13. He was professor of chemistry at Penn College in Iowa (1909-10) and associate professor at Syracuse University (1913-15). In 1918 he became professor of chemistry at Wesleyan University. He has made determinations of atomic weights of elements, investigated tobacco smoke, and studied the analyses of gases. During the War he served with the Chemical Warfare Service and invented a gas absorbent and a gas detector, both of which were of value.

HOOVER, HERBERT CLARK (1874-). An American public official. He was born in Iowa, where his father, a Quaker, cultivated a farm. Left an orphan at 10 years of age, he was sent to his uncle's farm in Oregon to live. He ran away when he was 14 and went to Portland, Ore., where he worked for a while in a real estate office. In 1891 he entered the newly established Leland Stanford Junior University, working his way through by establishing a laundry of which he made a success. Specializing in geology and engineering, he was in the first class graduated by the university. To perfect himself as a mining engineer he went to California and became a common workman in mining, passed through the several grades, and acquired familiarity with every part of the work. In 1897 he went to Australia as a mining engineer for an English syndicate and was successful in developing some mines there. In 1899 he was appointed director general of mines by the Chinese government. His work in China was interrupted by the Boxer troubles; he was in Tientsin when the foreigners were besieged there. He defended not only his European coworkers but his Chinese workmen too, rescuing them in some cases from the firing squad. Later he was engaged in mining operations in various parts of the world. He made and lost two fortunes and eventually won lasting success. He was living in England at the outbreak of the War, and his services were at once required in aid of Americans stranded there with their funds cut off. Soon afterward he was put in charge of the Belgian relief work and attracted wide attention by his great abil-

ity and enthusiasm. During three years he traveled throughout Belgium and visited Brussels, London, Rotterdam, Lille, and Berlin, in order to confer with the heads of governments. Although \$1,000,000,000 was expended on food and transportation, about one-half of 1 per cent was required for overhead expenses. He was appointed United States Food Administrator in 1917. He announced that the people of the United States could diminish their expenses in the necessities of life by 50 per cent. He instituted "wheatless days," and "meatless days," and urged avoidance of all waste. After the War, Mr Hoover devised a chain of food depôts throughout central Europe on which relatives and friends in the United States could draw for relief of the starving people in the countries desolated by the conflict. In March, 1921, he entered President Harding's cabinet as Secretary of Commerce, with the understanding that he was to continue his relief work. In 1921, he assumed general supervision of the relief work in Russia, on condition that all American prisoners held by the Soviet authorities should be released.

He wrote *Principles of Mining* (1909), and in collaboration with his wife, who was Lou Henry of Monterey, Cal., a fellow-student at Stanford University, he translated into English Agricola's *De Re Metallica*.

HOPE, ANTHONY. See **HAWKINS, ANTHONY HOPE.**

HOPE, JOHN (1868-). An American educator, born at Augusta, Ga., and educated at Brown and Chicago Universities. After graduation from college he devoted all his time to teaching colored youth. He served on the faculties of several colleges and universities in the South and was appointed president and professor of ethics at Morehouse College (then Atlanta Baptist College) in Atlanta, Ga., in 1906. In 1918-19 he did war work among the colored troops in France. He was a director and trustee of many institutions for colored people.

HOPKINS, ARTHUR MELANCTHON (1878-). A dramatic producer, born in Cleveland, Ohio, who began his work in New York City in 1912. His best recent productions include *The Poor Little Rich Girl*; *On Trial*; *The Deluge*; *Good Gracious, Annabelle*; *The Rescuing Angel*; *Be Calm, Camilla*; *The Jest*; *Night's Lodging*; *Daddy's Gone a-Hunting*, *The Claw*; *Anna Christie*; *The Hairy Ape*; *The Old Soak*; *Rose Bernd*; *The Laughing Lady*; *Launzi*; *A Royal Fandango*, and plays by Tolstoy, Ibsen, and Shakespeare.

HOPKINS, EDWARD WASHBURN (1857-). An American philologist (see VOL. XI). He has been professor of Sanskrit language and literature and comparative philology at Yale since 1915 and has published *Epic Mythology* (1915) and *History of Religions* (1918).

HOPKINS, ERNEST MARTIN (1877-). An American educator, born at Dunbarton, N. H. He graduated from Dartmouth in 1901 and from that year to 1905 was secretary to the president there. He was secretary of the college from 1905 to 1910 and until 1916 was engaged in original research for various industrial concerns in Chicago, Boston, and other cities. He became president of Dartmouth on July 1, 1916. During 1918 he was in charge of the Industrial Relations of the Quartermaster Department, United States Army, and assistant to the Secretary of War in charge of industrial

relations. He represented the War Department on the War Labor Policies Board in 1918.

HOPKINS, WILLIAM JOHN (1863-). An American author (see VOL. XI). His later works include *Those Gillespies* (1916); *The Clammer and the Submarine* (1917); and *She Blows' and Spun at That* (1921).

HOPPE, WILLIAM H. (1887-). World's champion at 182 and 181 balckline billiards. He was born at Cornwall-on-the-Hudson, N. Y. From 1910 he reigned supreme as a wielder of the cue despite the many times he has been called upon to defend his laurels. Beaten in match play at rare intervals by such stars of the game as Jacob Schaefer, he has always succeeded in defending his championship honors.

HOPWOOD, AVERY (1884-). An American playwright, born in Cleveland, Ohio. He came to New York City as a correspondent for the *Cleveland Leader* and there sold his first play, *Clothes*, written with Channing Pollock. His plays have been produced in the United States, Canada, Europe, and the Orient. The best known include *Fair and Warmer*; *The Gold Diggers*; *The Bat*; *Spanish Love*, in collaboration with Mary Roberts Rinehart; *Ladies' Night*; *The Demi-virgin*; *Little Miss Bluebeard*; *Why Men Leave Home*; *The Alarm Clock*, and *The Best People*, with David Gray.

HORMONES. See **SECRETIONS, INTERNAL; ZOOLOGY, Physiology; HEREDITY.**

HORNBY, LESTER GEORGE (1882-). An American illustrator, engraver and painter, born at Lowell, Mass., and educated at the Rhode Island School of Design at Providence, the Pape School in Boston, and the Art Students' League of New York. In Paris he studied with Laurens and others. Representative pictures of his are in the Victoria and Albert Museum (London), the Library of Congress (Washington), the New York Public Library, the Art Institute of Chicago, Detroit Institute, Carnegie Institute (Pittsburgh), etc. He has illustrated sketch books of London, Edinburgh, Paris, and Boston. His war etchings are well known.

HORNE, HENRY SINCLAIR, first BARON (1861-). A British soldier. He was educated for the army at Woolwich and served in the South African War. In 1914 he was made commander of the artillery of the 1st Corps, and in the following year commanded the 2d Division. He was sent to Egypt to defend the Suez Canal in 1916 and in the same year commanded the 15th Army Corps. Later in that year he was given command of the 1st Army in France. He served with great distinction. In 1909 he was created Baron of Stirkoke and was given the eastern command. Until 1920 he was general to the King.

HORNE, SIR ROBERT STEVENSON (1871-). A British statesman, born in Glasgow. He was educated at the University of Glasgow. He lectured on philosophy at the University College of North Wales in 1895. In the following year he was admitted to the Scottish bar and was elected to Parliament in 1910. In 1917 he was appointed assistant inspector general of transportation and in the same year became director of materials and priority in the Admiralty. In 1918 he was director of the Admiralty Labor Department. He was appointed, also in 1918, Third Civil Lord of the Admiralty. He was Minister of Labor in 1919; president of the Board of Trade in 1920-21; and Chancellor of

the Exchequer in 1921-22. He was knighted in 1920. In 1921 he was elected Lord Rector of Aberdeen University.

HORSLEY, SIR VICTOR ALEXANDER HADEN (1857-1916). An English surgeon and neurologist (see VOL. XI). On the outbreak of the War Sir Victor was put at the head of a hospital which saw service in Egypt. At a later period he was made a colonel in the Mesopotamia Expeditionary Force and in the course of his duties succumbed at Amara to heat stroke. A biography of him by Stephen Paget appeared in 1919.

HORTHY DE NAGYBANYA, NIKOLAUS (1868-). Regent of Hungary. Early in life he entered the navy. During the War he gave efficient service as captain of the battleship *Novara*. He was promoted to be admiral of the fleet and in this capacity surrendered the Austrian fleet to the Allies in 1918. In 1919 he organized a counter-revolution against the Soviet government in Hungary, under Bela Kun, and on the fall of that government, came into supreme control. He was elected regent in 1920 on the theory that the monarchy in Hungary was only temporarily suspended. By provision of the laws, he holds this office for an indefinite period. See *HUNGARY, History*.

HORTICULTURE. Activities in this field showed both the destructive and stimulant effects of the War during the period dominated by it. Increased demands for fruits and vegetable products of all kinds resulted in an unprecedented speeding-up of production, followed by a corresponding decline on the close of hostilities. At the same time labor costs rose excessively, and failing to recede with the drop in prices, they made the period of readjustment particularly difficult for the growers of all forms of perishable products. The long continued and bitterly contested railroad strike of 1922 was a bitter blow to fruit and vegetable producers, sorely needing an opportunity to recover from the disastrous conditions following the War. The period showed a gradual movement from amateur to commercial production. The ravages of insect and fungus pests, making expensive spraying machinery an absolute necessity, eliminated many poorly kept orchards and plantations. The haphazard methods of the past yielded to scientific practices. This trend in commercial horticulture is clearly outlined in statistics furnished in the 1920 census, which shows that the number of bearing, deciduous fruit trees dropped from 301,117,277 in 1910 to 230,781,135 in 1920. In the Pacific Coast States, always the stronghold of commercial orcharding, there was at the same time a noticeable increase in the number of trees. The greatest decline occurred in the Mississippi Valley region, where small farm orchards were the general rule. The greatest loss in bearing trees occurred in the apple and peach; the pear, plum, and cherry nearly held their own, and the apricot showed slight gains. Despite the decline in the number of trees the total production of orchard fruits increased slightly during the period, and the value of fruits trebled. The number of grapevines in the United States gained slightly during this census period, and citrus fruits of all species showed consistent increases. Bearing orange trees increased from 9,737,927 in 1910 to 14,397,836 in 1920; lemons from 956,920 to 2,921,608; grapefruit from 710,040 to 1,938,453; and tangerines from 27,-

271 to 41,310. The total production of citrus fruits increased from 23,502,128 boxes in 1909 to 38,107,060 in 1919.

One of the striking changes in the fruit industry of the country during the same census period was the serious setback to the pineapple industry, as indicated in figures showing that the number of bearing plants declined from 37,948,399 in 1910 to 2,897,141 in 1920. Bearing nut trees, pecans, Persian walnuts, almonds, etc., increased from 5,027,788 in 1910 to 6,524,125 in 1920. At the same time the value of the nut crops increased from \$4,447,674 in 1909 to \$29,714,396 in 1919. Peanut acreage enlarged from 869,887 acres in 1909 to 1,125,100 acres in 1919, white potato acreage decreased from 3,666,855 to 3,251,701; sweet potato acreage increased from 641,255 to 803,727; and small fruit acreage decreased from 272,460 to 249,084. The nursery industry of the country showed no gain, sales in 1919 amounted to \$20,434,389 as compared with \$21,050,822 in 1909. The number of square feet under glass was increased from 114,655,276 to 162,368,593. Imports of vegetables, fruits, and nuts reached a maximum in 1919 and 1920 and thereafter exhibited a sharp decline. Export trade in these items followed the same general trend. However, both imports and exports were considerably higher in value at the end of the 10-year period than at the beginning. In respect to the horticultural industry throughout the world at large, one of the most striking features was the rapid extension of the citrus industry in South Africa and Australia. Both countries developed their plantations to such an extent as to oversupply home consumption and render exportation to Great Britain a necessity.

Protective Acts. One of the most important developments was the organization of the Federal Horticultural Board, as the result of the plant quarantine act of Aug. 20, 1912. This board, given power to promulgate and enforce necessary protective measures for preventing the entrance of insect and fungus pests into the United States, became at once a power for good to the Nation's agriculture. That such protection was long needed is shown by the entrance in the past of many serious pests, including the San José scale, gypsy moth, Japanese beetle, chestnut blight, white pine blister rust, etc. The enactment of Quarantine 37, effective on and after June 1, 1919, prohibiting, with certain exceptions, the importation of nursery stocks and other plants and seeds into the United States, had a very great effect on American horticulture, especially on those branches concerned in the propagation and dissemination of ornamental plants. As a result, it became necessary for the nurserymen in this country to propagate many species of plants hitherto imported from foreign countries.

The continued spread, despite vigorous repressive efforts, of the European corn borer, Japanese beetle, and many other serious pests entering the United States previous to the organization of the Federal Horticultural Board, caused serious alarm. In many cases the pests had spread so rapidly that their eradication was considered out of the question. The potato wart disease, for a time considered a very serious menace to the potato industry of the United States, was found controllable by the planting of resistant varieties. (See **POTATOES**.) The gypsy moth, continuing its westward march through-

out New England, threatened the Adirondack and Catskill forests, in spite of vigorous efforts made to stay its progress. More encouraging was the likelihood of eradicating the *Parlatoria* date scale, an insect which, if uncontrolled, was believed capable of wiping out the infant date industry of the southwestern States.

Transportation. Material advances were made in the slugging of perishable products. The cooling of fruits and vegetables previous to placement in refrigerator cars became general and enabled distant growers to get their products to the consumer without material loss in quality. The motor truck practically replaced the horse in the truck garden industry in the vicinity of large cities, making possible not only a geographical expansion of the trucking industry but also a quicker movement of highly perishable products.

Marketing. No phase of horticultural activity exhibited such radical changes as that of marketing. Literally hundreds of cooperative agencies sprang up in various parts of the country and in most cases rendered material assistance to the long-suffering grower. The marked success of the California Fruit Growers' Exchange, operating under the adverse conditions of the War, propagated the cooperative idea, at a time when extremely low prices were being received for most commodities. A new system of selling fruits and vegetables arose. This was the f. o. b. auction, in which the product is inspected at the point of origin by government authorities and sold on this basis while in transit to market, and the returns are made to the grower within 48 hours after sale. One striking development was the tremendous growth of roadside markets in the vicinity of cities and along important highways. An idea of the importance of this way of selling can be gained from the rough estimate of 500,000 stands in operation in the United States in 1923. These markets became important in the disposal not only of fruits and vegetables, but also of flowers, canned products, cider, etc. Marketing was greatly aided by the development of better grading and packing practices, stimulated not only by greater demand for selected uniform products but also by the enactment of various Federal and State laws on the marketing and branding of fruits and vegetables. In response to these regulations numerous cooperative packing plants sprang up in various parts of the country.

Investigation. Despite the serious disrupting forces of the War, investigation progressed satisfactorily. The Oregon Experiment Station promulgated in 1918 the theory that growth and fruitfulness in plants is directly related to the proportion of carbohydrates and nitrogen in them. This concept has been of great benefit in assisting in the explanation of many cultural, pruning, and fertilization practices hitherto generally accepted but not understood. During the period it became definitely acknowledged that of the many fertilizers applied to fruit trees, nitrogen is the only material making an adequate return, and then only on poor soils or where trees are growing in sod. Studies in fruit storage contributed greatly to the knowledge of the proper time of picking and the importance of careful handling of fruit at all stages. Work of the United States Department of Agriculture in the standardizing of fruit and vegetable packages did much to protect the consumer from fraud. The development by the same depart-

ment of large-fruited blueberries afforded proof that much may yet be done to improve our native species of fruits. The discovery of bud variations in the citrus family explained the existence of many unfruitful and undesirable trees. Experimental results disproved one popular fallacy, namely, that all fruit trees require severe annual pruning.

War Gardens. Literally thousands of vegetable gardens were grown in war gardens, during the two years of the United States' participation in the war, by people who hitherto had never been interested in horticulture. The value of these gardens to the food reserves of the nation was estimated as approximately \$500,000 in 1918.

Plant Protection. Material advances were made in the method of protecting horticultural plants from various insect and fungus enemies. The utilization of dry insecticides and fungicides, known as dusts, steadily increased, until in many parts of the United States and Canada their use became an important part of the protective programme. The discovery that many economic plants, including the potato, tomato, raspberry, etc., are subject to a serious form of disease commonly known as mosaic caused a great deal of concern. Widespread, disastrous freezes occurring during the blooming periods of 1921 greatly injured the fruit crop in many parts of the country and reawakened an interest in orchard heating as a means of protecting fruits from disastrous loss. Considerable agitation was aroused in New England and New York over the death of Baldwin apple trees following the severe winter of 1919. However, it was generally conceded that this old and standard variety, despite its occasional tenderness to cold, could not be replaced.

Miscellaneous. One striking feature of the period was the gradual replacement of established varieties of fruits and vegetables by new and better sorts. The Delicious apple, from a modest position, became one of the leading varieties. The Stayman Winesap proved so much better than its parent, the Winesap, as to replace it largely in new plantings. The Golden Bantam and other yellow sweet corns gained favor over the older white sorts.

Necrology. Among prominent horticulturists, who died between 1914 and 1924 were Jackson Dawson, horticulturist, Aug. 3, 1916; Philippe de Vilmorin, French seedsman and scientist, June 30, 1917; J. H. Hale, fruit grower and public servant, Oct. 11, 1917; J. C. Whitten, scientific horticulturist, June 5, 1922; G. Harold Powell, manager of the California Fruit Growers' Exchange, Feb. 18, 1922; Walter Van Fleet, plant breeder, Jan. 27, 1922; and Samuel Parsons, landscape gardener, Feb. 3, 1923.

Bibliography. A few of the large number of horticultural books appearing during this decade were S. W. Fletcher, *The Strawberry in North America* (New York, 1917); V. R. Gardner, F. C. Bradford, and H. D. Hooker, Jr., *Fundamentals of Fruit Production* (New York and London, 1922); U. P. Hedrick et al., *The Cherries of New York* (Albany, 1915), *The Peaches of New York* (Albany, 1917), and *The Pears of New York* (Albany, 1921); W. Poponoe, *Manual of Tropical and Subtropical Vegetable Gardening* (New York and London, 1916); E. A. White, *The Principles of Floriculture* (New York, 1915).

HORTON, ROBERT FORMAN (1855-). An

English Congregational minister (see Vol. XI). His later volumes include *Reconstruction* (1915); *An Autobiography* (1917); and *The Mystical Quest of Christ* (1923.)

HOUBEN, HEINRICH HUBERT (1875-). A German author and director of the literary department of the annual Leipzig book fair. He was born at Aix-la-Chapelle and studied in Bonn, Berlin, and Greifswald. He founded the *Deutsche Bibliographische Gesellschaft* and was literary director of F. A. Brockhaus' publishing house (1907-19). He is the author of *Karl Gutzkow* (1899-1901); *Emil Derrient, Leben und Wirken* (1903); *Jungdeutschlands Sturm und Drang* (1911); *Die Deutsche Revolution* (1919); *Hartmanns Revolutionäre Erinnerungen* (1919); *Karl Schurz's Befreiung Kinkels* (1920); and *Adele Schopenhauer, Tagebuch einer Einsamen* (1921). He also compiled *Berühmte Autoren des Verlags F. A. Brockhaus* and edited the works of Sven Hedin.

HOUDINI, HARRY (1874-1926). An American magician, born at Appleton, Wis. He began his career as a trapeze performer in 1882. He invented a diving suit, was interested in producing moving pictures, and was awarded a prize by the Australian Aeronautic League in 1910 for the first successful flight in Australia. He made many tours of the world and gave performances before the notables of various countries. He gained fame by exposing the tricks of mediums, as well as by his own remarkable achievements as a magician. He wrote *The Right Way to do Wrong* (1906); *Handcuff Secrets* (1907); *The Unmasking of Robert Houdini* (1908); *Miracle Mongers* (1920); *Spooks and Spiritualism*; and *Rope Ties and Escapes*.

HOUGH, EMERSON (1857-1923). An American writer, born in Newton, Iowa, and educated at the University of Iowa in 1880. He spent many years in traveling over the West and wrote much on the protection of game and other subjects relating to the public domain of the United States. He was responsible for the passage of the act of Congress for preserving buffalo in Yellowstone Park. He wrote *The Singing Mouse Stories* (1895); *The Story of the Cowboy* (1897); *Mississippi Bubble* (1902); *The Lady and the Pirate* (1913); *The Magnificent Adventure* (1915); *The Way Out* (1918); *The Covered Wagon* (1922); *North of 36* (1923); and the posthumous *Mother of Gold* (1924). *The Covered Wagon*, as a moving-picture, was the most successful made up to that time. It ran steadily over a year in New York City.

HOUGH, LYNN HAROLD (1877-). An American clergyman (see Vol. XI). Among his later works were: *The Quest for Wonder* (1915); *In the Valley of Decision* (1916); *The Little Old Lady* (1917); *The Significance of the Protestant Reformation* (1918); *The Clean Sword* (1918); *The Productive Beliefs* (Cole Lectures at Vanderbilt University; 1919); *The Eyes of Faith* (1920); *The Opinions of John Clearfield* (1921); and other volumes.

HOUGHTON, ALANSON BIGELOW (1863-). An American manufacturer and diplomat, born at Cambridge, Mass., and educated at Harvard University, in Germany, and in Paris. He engaged in the manufacture of glass at Corning, N. Y., and became president and official in several important glass companies and other concerns. He was a member of Congress, 1919-23, but resigned on his ap-

pointment as Ambassador to Germany by President Harding in February, 1922.

HOURS OF LABOR. The last 10 years have seen a marked general reduction of hours of labor. That long hours do not pay had been coming more and more to be believed. The experiences of the War and particularly the report of the British munitions workers' committee established this general principle beyond doubt. Moreover, the influence of the forces of labor was steadily gaining and culminated in considerable economic power during the War. These two circumstances combined not only to stimulate legislation for the limitation of working hours, but also to decrease hours of work in the industries which were not affected by the protective laws.

According to the Census of Manufacturers of 1914, 11.8 per cent of the workers covered worked in eight-hour establishments. In the 1919 census, 48.6 per cent did so, while advance figures compiled for the 1924 census showed that 51.5 per cent worked in eight-hour plants.

Hour legislation in this country is still, due to constitutional limitation, largely confined to the protection of women and children. During the past decade, however, were enacted the La Follette Seamen's Act of 1915 and the Adamson Act of 1916, regulating respectively the hours of maritime and interstate railway workers. Numerous eight-hour restrictions on work undertaken for the State and several special prohibitions of long working hours in certain particularly dangerous occupations such as mining and caisson work have also become law. A recent Oregon statute provides for an eight-hour day in the lumbering industry when the adjoining States have adopted similar restrictions. Within the decade, 16 States have been added to the ranks of those which regulate the working day or week of women either generally or in certain occupations, while the scope of many other laws and orders which applied only to specified employments has been made more general.

Legislation, however, has not been limited to the restriction of daily or weekly hours of work. In addition, nine more jurisdictions now prohibit or regulate the night work of women, while of the eight night-work laws already in effect in 1914 several have since been enlarged in scope. New regulations providing for daily rest periods and a weekly day of rest have also been adopted, while the effectiveness of many of those previously operating has been increased (see WOMEN IN INDUSTRY).

The working hours of children are limited to eight in 35 jurisdictions—a substantial gain over 1914—while every State now regulates to some extent either the daily or weekly hours of child labor. Some of these restrictions, however, are generally regarded as inadequate, such as a 60-hour week in South Dakota, Louisiana, Georgia and North Carolina and an 11-hour day in North Carolina. Some are difficult to enforce, while others permit a large number of exceptions. The recent Federal child labor amendment will, when it has been ratified by the necessary three-fourths of the States, enable Congress to enact an adequate universal restriction of hours of labor for children (see also CHILD LABOR).

In addition to these statutory limitations on working hours in the United States, union pressure as well as public sentiment has worked

towards a general reduction of hours in fields not affected by legislation. Perhaps the most outstanding example of this is the final adoption in 1923 by the steel industry of a three-shift eight-hour system instead of the former two-shift system, in deference, according to the executive head of the United States Steel Corporation, to "public sentiment, however created." See TRADE UNIONISM; LABOR ORGANIZATIONS, INTERNATIONAL; LABOR LEGISLATION; LABOR ARBITRATION; STRIKES.

HOURTICQ, LOUIS (1875-). A French art critic, born at Brossac, in Charente, and educated in Paris at the Ecole Normale. He was appointed professor of aesthetics and the history of art at the Ecole des Beaux Arts and was also a member of the Superior Council of Public Instruction.

He is the author of *Rubens; France, Histoire Générale de l'Art Français; Les Tableaux du Louvre; Récits et Réflexions d'un Combattant; La Jeunesse de Titien; Initiation Artistique; Manet; Histoire de la Peinture, des Origines au Seizième Siècle; La Galerie de Médicis au Louvre; Every One's History of French Art; De Poussin à Watteau.*

HOURLICH, ISAAC A (ARONVICH) (1860-1924). An American statistician (see VOL. XI). His later works include *Mooted Questions of Socialism* (1917); he was also editor of a Yiddish translation of *Das Kapital* by Karl Marx (1919).

HOUSE, EDWARD MANDELL (1858-). An American publicist, born at Houston, Tex., and educated at Cornell University. He engaged in business in Texas and was at the same time active in Democratic politics as adviser, though not as an active participant or candidate for office. He was among the most prominent of those who worked for the nomination of Woodrow Wilson for the presidency in 1912, and he gained the confidence of Mr Wilson to a marked degree. The President relied on him for advice in matters of appointment and policy. In 1914, at the outbreak of the War, he visited the warring countries in an effort to find a basis for peace. During the years following he made several other visits to Europe with the same purpose. When the United States entered the War in 1917, he attended the meetings of the Supreme War Council of the Allies in London, as chairman of the American Commission, and in that capacity communicated the views of the American government in regard to the conduct of the War to the Allied premiers and foreign ministers. As the end of the War approached in 1918, he was designated by President Wilson to act for the United States in negotiations for an armistice with the Central Powers. He was a member of the American Commission to Negotiate Peace at Paris, and during the absence of President Wilson from the United States, was practically in charge of American negotiations. On President Wilson's return to Paris, a break occurred in the relationship, and Mr House ceased to take a prominent part in the deliberations. Following the War he retired from public life. He was joint editor, with Prof. Charles Seymour, of *What Really Happened at Paris*, and also published an autobiographical novel. In 1920 he joined the staff of the *Philadelphia Public Ledger*.

HOUSE, ROY TEMPLE (1878-). An American educator, born at Lexington, Neb., and educated at Miami University and the Uni-

versity of Michigan. He taught French and German in several schools and colleges until 1905, when he was appointed head of the modern language department at the Oklahoma Southwestern State Normal School, where he served until 1910. In the following year he was exchange professor in Germany. In 1911 he became professor of German and in 1918 head of the modern language department of the State University of Oklahoma. He was director for the Commission of Relief in Belgium in 1916 and was engaged in other important war work; he received decorations from the Belgian government for his services. His published writings include *Three French Comedies* (1905) and *Classroom French* (1910). He also translated several foreign plays and contributed book reviews to periodicals.

HOUSING. The housing problem even before the War was rapidly becoming serious. Already overcrowded conditions were being aggravated by the normal increase in population and the concentration in industrial centres. The difficulty of providing houses to rent at a figure attractive to workmen was discouraging new building by investors, and the tradition of home ownership by workers appeared to be dying out. War conditions brought the situation to a crisis. For a time after the opening of the War there was practically general suspension of building activities, on account of the shortage of material and labor and the highly increased costs. Repairs were neglected, replacements were not made, adequate provision was not supplied even for the normal increase in population, to say nothing of the emergency concentration at industrial centres. The congestion reached the previously unaffected middle classes. The return of the soldiers after the Armistice increased the urgency, and those governments which were not forced to deal with the situation during the War were unable to evade the issue in the years that followed. A brief account is given below of the widespread legislation, marking the post-war period, which aimed fully to utilize existing facilities, to curb profiteering, and to encourage building. Although in 1921 the house shortage was still serious, not only in every important country but even in centres as remote as Bagdad and Bombay, it was generally held that the crisis had been passed, notwithstanding the fact that it would take many favorable years to make up the deficit.

United States. In 1917, the acute scarcity of housing accommodation, especially in munitions and shipbuilding centres, made Federal action imperative. The United States Shipping Board was given an appropriation to provide housing for its workers (\$10,000,000 was spent at Hog Island alone in that year); and in 1918 an additional \$95,000,000 was granted for this purpose, \$20,000,000 of which was to go for transportation facilities. The War Department also built temporary villages adjacent to inaccessible munitions plants. The United States Housing Corporation, with a total appropriation of \$100,000,000, carried on construction for the Bureau of Industrial Housing and Transportation in 128 communities, housing 25,000 families and 25,000 single laborers, after the Armistice, 6000 families and 8000 single laborers (See BRIDGEPORT.) One of the benefits resulting from Federal investigation was the development of standards for industrial housing. Although it was

estimated that between \$150,000,000 and \$250,000,000 was spent for workers' housing throughout the country in 1918, rents continued high, and in 1919 it was estimated that 1,000,000 additional houses were needed. There was a shortage of 35,000 apartments in New York City, and Chicago reported facilities 20 per cent less than requisite. To alleviate the situation, New York passed laws to permit the remodeling of old-type buildings, to protect tenants, and to stimulate building; the St. Louis Chamber of Commerce formed a \$2,000,000 building association; North Dakota launched a programme of State aid for houses not exceeding a cost of \$5000. The effort to stimulate building produced laws

of their incomes for rent, and that the total surplus of vacancies was so small as to necessitate the immediate extension of the emergency rent legislation, without discrimination as to rentals, for two years. It recommended the use of State and municipal credit for housing purposes. By the middle of January, 1924, several bills relating to rent laws were before the Legislature and two constitutional amendments had been proposed. See LAW, PROGRESS OF THE.

The following table comparing home-ownership statistics for the years 1910 and 1920 shows a decrease, slight yet of some significance, in the economic independence of the population of the United States:

Year	Per cent of all homes			Owned Encumbered	Per cent of owned homes	
	Rented	Owned	Free		Free	Encumbered
1910	54.2	45.8	30.8	15.0	67.2	32.8
1920	54.4	45.6	28.2	17.5	61.7	38.3

exempting new structures from taxation; and other laws attempted to control profiteering by setting a maximum per cent of increase within a given period and by limiting the landlord's arbitrary right to dispossess. In 76 cities profiteering committees were formed; in 50 others, the Bureau of Industrial Housing and Transportation adjusted rent disputes. Although, after some improvement in conditions during the summer and fall, the crisis was believed to have been passed toward the close of 1920, the United States in 1921 was still facing a deficit of about 147 per cent of its normal building programme, which affected about 4,000,000 people. It was true that building costs had fallen, but private builders were still holding off awaiting a still further decrease. As for investors, with building costs still 100 per cent above the pre-war level and rents only 25 per cent above, home-building did not attract their capital; and while investigation pointed to from 13 to 14 per cent gross as the minimum return from any rented property, it was claimed that legislative interference kept rents at a figure that did not encourage building as an investment. About this time, price-fixing combines among contractors and producers of material, in some cases working in conjunction with corrupt labor leaders, were uncovered in New York and in Illinois. The general level of rent increases in 1921 was far above 25 per cent over pre-war figures. In one or two localities where there were rent laws, landlords were required to prove the reasonableness of any increase over 25 per cent above 1914 rents, but in general there were few places where the increase was not much greater. The cities covered by the Bureau of Labor Statistics showed in 1921 an increase ranging from 25.8 per cent in San Francisco and Oakland to 93.4 per cent in Norfolk, Va., the general increase ranging about 60 per cent (*Monthly Labor Review*, February, 1922, pp. 59-64). Other authorities show a greater increase. (See COST OF LIVING.) Figures for the first six months of 1923, returned from 65 cities of 100,000 or more inhabitants, showed issues of permits to house 195,015 families, or an increase of 47,766 over the first half and 49,361 over the second half of 1922.

In New York State, the housing commission, after an investigation, handed in a report in December, 1923, finding that rents had increased in three years between 40 and 93 per cent, that families with an income of from \$1000 to \$1500 a year were paying approximately 23 per cent

Investigation of housing conditions and legislation for their control were much stimulated and guided during the years after 1910 by the activities of the National Housing Association. Other attempts to improve the type of workers' homes were made by limited dividend companies (formed by philanthropic organizations, chambers of commerce, etc.), cooperative housing associations, and by both Federal and State authorities. Cooperative housing showed a little progress. There were some successful experiments in the larger cities, and Wisconsin passed an act promoting it. There had been no tendency in the United States to follow that European policy under which the government builds workers' homes; for, although Massachusetts did, with State money, build and sell 12 houses, the experiment seemed to have been abandoned afterward, and the Federal government's construction during the period was concerned only with war industry. Those forms of encouragement most in favor seemed to be the elimination of taxes on mortgages, tax exemption on new buildings, and government aid in the financing of local activities; construction itself was chiefly in the hands of contractors, although a considerable activity was shown by building and loan associations.

Great Britain. Following the outbreak of the War, two housing acts were passed, in 1914, but these being limited in scope were not generally productive of results. Investigations in 1917 uncovered an immediate need of 400,000 dwellings in England and Wales and 100,000 in Scotland. Since it was evident that private enterprise could not meet the situation, the Housing Bill of 1919 was passed, making it incumbent on local authorities to carry out housing schemes, with the government assuming the annual deficit in excess of a penny rate. In the same year an additional act went into force, providing a subsidy of £15,000,000 for private persons building small houses; checking luxury building and the wrecking of dwellings; and otherwise facilitating construction. This undertaking to provide for a shortage of from 500,000 to 800,000 houses was abandoned in 1921, in an effort to cut down expenditures. The new policy called only for the completion of 198,000 houses already undertaken, at a cost of £10,005,000, and an expenditure of £200,000 in improvement of slum areas. This discouraging outlook, however, was lightened by the activities of about 60 local building guilds. A rent law fixing the percentage of increase and controlling

dispossession had been extended in 1919, and replaced by a new law in 1920. Further extension of these provisions became a definite political issue in 1923, when general decontrol was deferred to June 24 1925, and the protection of the tenant extended to 1930. Nevertheless, under the 1923 rent law, it was much easier for landlords to evict tenants, and since with the coming in of a new tenant a house was "decontrolled," thereafter the landlord could charge what rent he pleased, subject only to a vague review by the courts. Complaints were coming in from various cities that tenants were being forced out, and being unable to secure other quarters, were crowding workhouses in London to an alarming extent. Another bill providing for state aid to housing, on a smaller scale, was passed also in 1923, under which about 40,000 houses a year were being built.

France. In 1919, there were still 550,000 buildings to be supplied in the devastated area, and there was much overcrowding in the larger towns. A Cheap Dwellings Bureau was making some progress in that year with garden suburbs outside of Paris; and the destruction of the Paris wall and military zone was ordered, making available about 3025 acres. Government aid was being given in 1921 to about 2000 coöperative societies of reconstruction. Rent-limiting legislation had been found necessary; also some control over lodging and boarding houses.

Germany. The situation in Germany was complicated by the unsettled financial and labor conditions. In a number of towns, house room was rationed and civilians were billeted in private homes; and letting or selling was subject to regulation. In 1921, a national law required all states to spend at least 30 marks per head on house construction in 1921-22. Nevertheless, by 1922, construction had practically ceased. The owners, with only about $\frac{1}{2000}$ of their interest left to them by the rent-fixing law, had been practically expropriated. An attempt to raise a special fund for building was made in 1923 by levying a housing tax, fixed at 30 times the pre-war rent of houses. A law passed in 1923 to protect tenants was to have force until 1926.

Italy. In 1920, Italy was trying to meet the situation through coöperative societies and building clubs in the north and by the building of garden suburbs around Rome (where one-third of the population were without permanent homes), building activity being encouraged by a government subsidy of 100,000,000 lire, a drastic rent law passed in 1919, and certain tax exemptions. Restrictions on rent were, however, to end June 30, 1923, profiteering thereafter to be checked by the creation of a court of arbitration with power to decide in case of a deadlock between landlord and tenant, and by a threat to renew the rent law for 10 years if the landlords abused their privileges.

Other Countries. Canada did nothing with respect to housing during the War but in 1919 voted \$25,000,000 to assist workingmen, particularly soldiers, to build homes at lowest cost, the fund to be distributed among the provinces on the basis of population; and similar action was taken in Australia in 1920 and in New Zealand in 1921. Belgium provided a housing subsidy of 100,000 francs in 1920; only 4000 of its 150,000 devastated dwellings having been replaced by that time. In Holland, where, notwithstanding an act in 1918 that provided

for 90 per cent loans for building purposes, there was a shortage of 60,000 houses in 1920, the situation in 1923 was much improved, partly due to a movement back to country towns and villages. Norway had a shortage of 18,000 houses at the beginning of 1919 and in 1920 several municipalities were going heavily into new construction. In Sweden where it had been necessary in 1919 to float a lottery bond loan to aid in building, and to pass rent restriction laws, by 1923 the shortage had perceptibly decreased. In 1920, Czecho-Slovakia was rationing rooms. Conditions in Soviet Russia were difficult to ascertain, but building permits to the number of 8914 from 271 municipalities in 1923 showed that 98.6 per cent of the structures planned for in that year were one-story houses of wood and other semipermanent materials; no buildings were to be more than two stories; and all were being built by owners. A survey of the principal centres of Denmark in October, 1923, showed 20,088 homeless individuals. In May, 1923, Copenhagen, finding part of its congestion due to an influx from the provinces, passed a law, retroactive to April 21, to check the movement by forbidding the leasing of apartments without a permit to persons with a residence elsewhere or whose last residence was outside the city.

HOUSMAN, LAURENCE (1865-). An English artist and author (see Vol. XI). His later publications include: *Bird in Hand* (1916); *The Sheepfold* (1918); *St. Francis Poverello* (1918); *The Heart of Peace* (1919); *The Wheel* (1919); *Ploughshare and Pruning-hook* (1919); *The Death of Orpheus* (1921); *Angels and Ministers* (1921); *A Peep-show in Paradise* (1921); *Little Plays of St. Francis* (1922); *De thronements* (1922); *Moonshine and Clover* (1922); *A Doorway in Fairyland* (1922); *False Premises* (1922); and *Echo de Paris* (1923).

HOUSTON. A city and port of entry of Texas, situated on the Houston Ship Channel. The population increased 61 per cent from 85,784 in 1910 to 138,278 in 1920, to 154,970 by estimate of the Bureau of the Census for 1923 and to 195,409 by local estimate. In 1919, the development of Houston as a cotton port was inaugurated; in 1924, the city celebrated the exportation of her millionth cotton bale for one shipping season, and the attainment of rank of second cotton port in America. A \$4,000,000 bond issue was voted in 1923 to provide for the construction of six additional wharves 500 by 150 feet, a 5-mile extension of the harbor belt railway, and a grain elevator with initial capacity of 1,000,000 bushels and storage capacity of 9,000,000 bushels. The tonnage of the port increased 340 per cent in the four years from 1920 to 1923, from 714,621 to 3,149,196, and its value 194.8 per cent from \$72,967,344 to \$215,109,522; building increased 435 per cent between 1914 and 1923.

HOUSTON, DAVID FRANKLIN (1866-). An American public official (see Vol. XI). From February, 1920, to March, 1921, he was Secretary of the Treasury. He was also chairman of the Federal Reserve and Farm Loan Boards. From 1916 to 1920 he was a member of the Council of National Defense.

HOVGGAARD, WILLIAM (1857-). An American naval architect, born at Aarhus in Denmark. He graduated from the Naval Academy of Denmark in 1879 and from the Royal

Naval College at Greenwich, England, in 1886. After service in the Royal Danish Navy he was a member of the Danish expedition at St. Croix to observe the transit of Venus in 1882. After naval service from 1897 to 1901, he came to the United States and became professor of naval design and construction at the Massachusetts Institute of Technology. He was employed in the Bureau of Construction and Repair of the Department of the Navy in 1917-18. He is a member of many naval and scientific societies and is the author of *Submarine Boats* (1887); *Voyages of the Norsemen to America* (1914); *Structure and Design of Warships* (1915); *Modern History of Warships* (1920), and *General Design of Warships* (1920).

HOWARD, CLINTON NORMAN (1868-). An American lecturer and temperance advocate (see VOL. XI). Some of his later lectures were "The World on Fire" (1917); "A Scrap of Paper" (1917); and "Cost, Cause and Cure of War" (1917).

HOWARD, JOHN GALEN (1864-). An American architect (see VOL. XI). From 1912 he was a member of the Board of Consulting Architects of San Francisco and from 1913 director of the School of Architecture of the University of California, for which he designed the Greek Theatre and other buildings. He was a member of the National Institute of Arts and Letters and was formerly president of the Society of Beaux Arts Architects. In 1918-19 he served as captain in the American Red Cross in France.

HOWARD UNIVERSITY. A nonsectarian, coeducational institution for the higher education of Negroes in Washington, D. C., founded in 1867, and largely supported by Congress. In 1918, all the secondary schools of the university were abolished and the whole plan of undergraduate work changed. The four-year college course was divided into two periods of two years each, the Junior College, and the Senior Schools. The semester system was abolished in June, 1919, and the quarter system substituted. Departments of architecture, of public health and of physical education were established. Despite the loss of the secondary students the total enrollment of the university rose from 1463 students in 1914 to 2123 in 1923. Twenty-six new members were added to the faculty between the reorganization of the university in 1918 and 1923, and the Congressional appropriations in the same period increased from \$117,937 to \$232,500 annually. A dining hall building with class rooms for the department of home economics was built in 1921 at a cost of \$301,000, and plans were under way for a new gymnasium and stadium. A greenhouse was erected in 1919, and Howard Hall, for many years used as a detention house for incorrigible children, was renovated and made a dormitory for girls; many improvements were also made on the campus. The General Education Board offered to give \$250,000 as an endowment to the Medical School provided the university raised a like sum. J. Stanley Durkee, Ph.D., D.D., became president in 1918.

HOWE, FREDERICK CLEMSON (1867-). An American lawyer and public official (see VOL. XI). From 1914 to 1919 he was Commissioner of Immigration at the Port of New York and published *Socialized Germany* (1915), *Why War?* (1916), and other economic and political works.

HOWE, GEORGE (1876-). An American educator, born at Wilmington, N. C., and educated at Princeton, the University of Halle, Oxford, and the American Classical School in Rome. He became professor of Latin at the University of North Carolina in 1903, and in 1919 dean of the College of Arts. He was a member of the State Council of Defense, 1917-18. Professor Howe was the author of several textbooks and associate editor of *Study and Philology*.

HOWE, HARRISON ESTELL (1881-). An American chemist, born at Georgetown, Ky., and educated at Earlham College and Michigan and Rochester Universities. In 1901 he became chemist to the Sanilac Sugar Refining Company and in 1902 went to the Bausch and Lomb Optical Company, with which he remained until 1915, when he became assistant to the president and later department manager of the research concern of A. D. Little in Cambridge, Mass. In 1919-22 he was chairman of the division of research extension of the National Research Council and also served as consulting chemist to the Ordnance Bureau. Later he was a major in the Retired Corps. In 1921 he became editor of the *Journal of Industrial and Engineering Chemistry*, and in the same year published *The New Stone Age*.

HOWE, MARK ANTONY DE WOLFE (1864-). An American editor and author (see VOL. XI). His later works include: *The Humane Society of the Commonwealth of Massachusetts* (1918); *The Atlantic Monthly and Its Makers* (1919); *George von Lengerke Meyer, his Life and Public Services* (1919); and *Memoirs of the Harvard Dead in the War against Germany*, 2 vols. (1920, 1921). He was the editor of *Harvard Volunteers in Europe* (1916).

HOWELLS, JOHN MEAD (1868-). An American architect, born at Cambridge, Mass., son of William Dean Howells. He graduated from Harvard in 1891 and afterward studied at the Ecole des Beaux Arts. From 1907 to 1917 he was a member of the architectural firm of Howells and Stokes of New York and Seattle. He designed and erected buildings for Harvard, Yale, and Columbia Universities and for banks and other financial institutions in New York, San Francisco, Seattle, and other cities. He was a member of the American Institute of Architects and the American Institute of Arts and Letters and president of the New York Society of Diplomat Architects of Paris. He contributed frequent articles on technical and literary subjects to magazines.

HOWITZERS. See ARTILLERY.

HOWLAND, HAROLD JACOBS (1877-). An American writer, born at Chatham, N. Y., and educated at Amherst College. He was with several publishing companies in New York and elsewhere until 1902, when he became a member of the editorial staff of *The Outlook*. He was associate editor of *The Independent*, 1913-20, and managing director of the Independent Corporation, 1919-20. In 1910 he was a candidate of the Progressive party for Congress and was a member of the State Executive Progressive Committee of New Jersey. During the War he served with the Y. M. C. A. in Italy. He was the author of *Theodore Roosevelt and His Times*, in the *Chronicles of America* series.

HOWZE, ROBERT LEE (1864-1926). An American soldier, born in Rusk county, Tex. He graduated from the United States Military

Academy in 1888 and was commissioned 2d lieutenant in the same year. He served as a volunteer in the Spanish-American War and rose to the rank of captain. In 1901 he was commissioned captain of the Regular Army. He served as major of the Porto Rico provisional regiment, 1901-04, and from 1905 was commandant of cadets of the United States Military Academy. After service in Porto Rico and as colonel of the 11th Cavalry, he was detailed to the General Staff in 1916. In the following year he was appointed brigadier-general in the National Army and commanded the 2d Cavalry Brigade on the Mexican border. He became major-general in 1918 and was given command of the 38th Division. With this he served in the Meuse-Argonne campaign and then was commander of the 3d Division with the Army of Occupation in Germany until Aug. 14, 1919. He was assigned to the Mexican border, commanding the 1st Cavalry Division.

HERDLICKA, ALES (1869-). An American anthropologist (see VOL. XI). His later works include *Notes on the Pathology of the Ancient Peruvians* (1914); *The Most Ancient Skeletal Remains of Man* (1914); *Physical Anthropology in America* (1914); *Anthropology of the Chippewas* (1916); *Physical Anthropology of the Lenape, Delaware and Eastern Indians in General* (1916); *The Old White American* (1917); *The Genesis of the American Indian* (1917); and *Anthropology of Florida* (1922).

HUARD, FRANCES WILSON (BARONESS HUARD) (1885-). An American writer and relief worker, born in New York City. She was privately educated and in 1905 married Baron Charles Huard, a painter and illustrator of Paris. At the outbreak of the War she turned her chateau over to the French government. When this building was destroyed, she transferred the hospital in 1917 to Paris, where she maintained 100 beds through funds collected during lecture tours in the United States. She wrote *My Home in the Field of Honor* (1916); *My Home in the Field of Mercy* (1917); and *Lilies White and Red*.

HUBBARD, HENRY VINCENT (1875-). An American landscape architect, born at Taunton, Mass. He graduated from Harvard University in 1897 and afterward studied landscape architecture there and also at the Massachusetts Institute of Technology. From 1906 to 1918 he was a member of the firm of Pray, Hubbard, and White, Boston. He was appointed instructor of landscape architecture at Harvard in 1906, assistant professor in 1910, and professor in 1921. He was a founder and chief editor of *Landscape Architecture*. During the War he designed and built several cantonments and also assisted in designing housing communities. He was a Fellow of the American Society of Landscape Architects and a member of the American City Planning Institute and the British Town Planning Institute. His writings on architectural subjects include *Introduction to the Study of Landscape Design*, in collaboration with Theodora Kimball (1917). In 1919 he edited the report of the United States Housing Corporation.

HUBERICH, CHARLES HENRY (1877-). An American lawyer, born at Toledo, Ohio. He was educated privately and studied law at the University of Texas, and in Germany. In 1898 he was admitted to the bar. He was a member of the faculty of the University of Texas from

1900 to 1905, when he was appointed assistant professor of law at Leland Stanford Junior University. He became professor in 1907. In 1909-10 he was professor of law at the University of Wisconsin. He was a member of several legal associations and is the author of *The Trans-Isthmian Canal* (1904), *Law Relating to Trading with the Enemy* (1918), and volumes on the commercial law of Australia, New Zealand, Canada, and other British dominions. He also edited volumes on the laws of the United States.

HUCH, RICARDA (1864-). A German poet, novelist, and historian (see VOL. XI). Her later works include a war novel in three volumes, *Der grosse Krieg in Deutschland* (1914); *Natur und Geist als die Wurzeln des Lebens und der Kunst* (1914); *Wallenstein* (1915); *Das Judengrab* (1916); *Luthers Glaube* (1916); *Der Fall Deruga* (1917), and *Der Sinn der Heiligen Schrift* (1919).

HUDSON, MANLET OTTMER (1886-). An American lawyer and educator, born at St. Petersburg, Mo., and educated at William Jewell College, Harvard University, and the Harvard Law School. He was assistant in history at Harvard and Radcliffe Colleges from 1907 to 1910, and from 1910 to 1919 professor of law at the University of Missouri. He joined the faculty of Harvard as assistant professor of law in 1919 and was made full professor in 1921. He was a member of many important commissions on State laws and in 1917 was attached to the office of the Solicitor to the Department of State. He was counsel of the United States Government Inquiry on the terms of peace, 1917-18, and served in other capacities at the Peace Conference in Paris. In 1919 he was a member of the legal section of the Secretariat of the League of Nations and acted as legal adviser to the International Labor Conferences in Washington and Genoa. He was the author of many articles in legal periodicals.

HUDSON, W. H. (1841-1922). A British naturalist and author, born at Quilmes near Buenos Aires, Argentina, of American parents who had settled there. He remained in South America till the age of twenty-nine, when after the death of both parents he made his home in England. Details of his early life except so far as they appear in his books are not known, but from the age of fifteen until he went to England he had traveled beyond the Rio Negro to Banda Oriental across the La Plata and westward over the pampas. Apart from his considerable reputation as an originally sympathetic and understanding writer in natural history, which began with the publication of *Argentine Ornithology* (1888-9), he attained also, by the quality of his prose, a high place in English literature. While his books dealing with England, in their informal, pleasing revelation of its people, its birds, all its small life, as he came upon these in less frequented corners, are here and there set with passages of a stirring, lyric beauty, it is in his writings on South America that he is most effective, poetic and colorful. In *Green Mansions* (1904), by far his finest literary work, he produced a masterpiece of poetic and compelling fiction, woven consistently in beautifully-textured prose. His published works include also: *The Purple Land* (1885); *A Crystal Age* (1887); *Naturalist in La Plata* (1892); *Idle Days in Patagonia and Birds in a Village* (1893); *British Birds* (1895); *Birds*

in *London* (1899); *Nature in Downland* (1900); *Birds and Man* (1901); *El Ombú* (1902); *Hampshire Days* (1903); *A Little Boy Lost* (1907); *The Land's End* (1908); *Afoot in England* (1909); *A Shepherd's Life* (1910); *Adventure among Birds* (1913); *Far Away and Long Ago and History of My Early Life* (1918); *Birds in Town and Village and The Book of a Naturalist* (1919); *A Traveller in Little Things and Dead Man's Pluck* (1921); and *A Hind in Richmond Park* (1922). Mr. Morley Roberts in *W. H. Hudson, A Portrait* (New York, 1924) while expressly disclaiming the office of biographer supplies a valuable body of information and personal reminiscences.

HUDSON RIVER TUNNEL. See TUNNELS.

HUGEL, FRIEDRICH, BARON VON (1852-). An Austrian-English writer on religion (see VOL. XI). In 1916 he wrote *The German Soul*; in 1921, *Essays and Addresses*.

HUGGENBERGER, ALFRED (1867-). A Swiss writer. He was born at Bewangen of farmer folk and attended only a village school. His writing, done in intervals of hard manual labor, found warm appreciation among German critics. He has written, in verse and fiction, *Hinterm Pfluge* (1908); *Von den Kleinen Leuten* (1909); *Das Ebenhöchst* (1911); *Die Bauern von Steig* (1913); *Die Stille der Felder* (1913); *Dorfgenossen* (1914); *Die Geschichte des Heinrich Lentz* (1915); *Aus Meinem Sonnengarten* (1917); *Die Heimliche Macht* (1919); and *Wenn der Marzwind Weht* (1920).

HUGGINS, MILLER J. (1880-). Professional baseball player and manager, born at Cincinnati, Ohio. His first big league engagement was with the Cincinnati National League Club where he served from 1904 to 1909 when he was traded to the St. Louis Club of the same league. He managed this club for five years and was then made manager of the New York American League Club, his team the "Yankees" winning pennants in 1921, 1922 and 1923, and the world's championship in the last-named year.

HUGHES, CHARLES EVANS (1862-). An American jurist and public official (see VOL. XI). He resigned from the Supreme Court, to which he had been appointed in 1910 by President Taft, in order to become Republican candidate for the presidency in 1916. He was defeated by Woodrow Wilson and returned to the practice of law. In 1919-20, by the appointment of President Wilson, he investigated alleged irregularities in the building of army and navy airplanes during the War. In March, 1921, he became Secretary of State in the cabinet of President Harding, and as such presided at the Disarmament Conference, Washington, in 1921-22. Other important problems which he handled as Secretary of State related to the German treaty, mandates, the oil controversy, and American participation in the World Court, which he advocated in 1923.

HUGHES, CHARLES FREDERICK (1866-). An American naval officer, born in Bath, Me. He graduated from the United States Naval Academy in 1884. During the Spanish-American War he served on board the *Monterey*, participating in the battle of Manila. He was on duty with the Bureau of Equipment from 1904 to 1906 and served as Chief of Staff of the Atlantic Fleet in 1913-14. He was a member of the General Board of the Navy Department

from 1914 to 1916 and served with the British Grand Fleet in the North Sea in 1917-18. In the latter year he was promoted to the rank of rear-admiral and was placed in command of the Navy Yard in Philadelphia.

HUGHES, HATCHER (?-). An American playwright, born in South Carolina, and educated at the University of South Carolina and Columbia University. In 1912 he started giving courses in the drama and playwriting at Columbia. For four years he directed the Morningside Players, an organization of Columbia University, which was the first to present a play by Elmer Rice. In 1922, with Elmer Rice, Mr. Hughes wrote *Wake Up, Jonathan*, in which Mrs. Fiske starred on tour for a solid season after three months in New York. In 1924 Mr. Hughes's *Hell-bent fer Heaven* was awarded the Pulitzer Prize.

HUGHES, HECTOR JAMES (1871-). An American educator, born at Centralia, Pa. He graduated from Harvard in 1894 and later studied at its Lawrence Scientific School. Meanwhile, during 1894-98, he was connected with the Brookline (Mass.) Town Engineer's Office and in 1899-1902 was connected professionally with the Chicago, Burlington, and Quincy Railroad in Chicago. In 1902 he returned to Harvard as instructor in civil engineering, becoming in 1914 professor of that subject, and in 1920 dean of the Engineering School. Also during 1914-18, he lectured on his specialty at the Massachusetts Institute of Technology. He is the author of *A Treatise on Hydraulics*, with A. T. Safford (1911), *Roads and Toll Roads in America* (1913), and *Highway Engineering Education* (1914, 1916).

HUGHES, RUPERT (1872-). An American writer (see VOL. XI). His later writings include: *Empty Pockets* (1915); *Clipped Wings* (1916); *The Thirteenth Commandment* (1916); *In a Little Town* (1917); *We Can't Have Everything* (1917); *The Unpardonable Sin* (1919); *Long Ever Ago*, a volume of Irish stories (1919); *What's the World Coming To?* (1920); *Beauty* (1921); *Monna* (1921); *Souls for Sale* (1922). He wrote and directed many motion pictures, including *Scratch My Back* (1920); *The Old Nest* (1921); *Dangerous Curve Ahead* (1921).

HUGHES, THOMAS WELBURN (1858-). An American lawyer and educator, born in Canada and educated in Canada and at the University of Michigan. From 1892 to 1898 he was instructor in law at that university and later served on the faculties of the University of Illinois and Louisiana State University. From 1912 to 1915 he was dean and professor of law at the University of Florida and served as dean there from 1919. He was the author of *Hughes on Evidence* (1906); *Hughes on Criminal Law* (1913); *Hughes: Cases on Evidence* (1920), and many pamphlets and magazine articles.

HUGHES, WILLIAM MORRIS (1864-). An Australian statesman, born in Wales. In 1844 he went to Australia, where he entered politics as a member of the Legislative Assembly of New South Wales, in 1893. He resigned this position to become a member of the Federal Parliament. In this body he devoted himself to the interest of labor and advocated a very advanced policy. He was attorney-general of various labor administrations from 1908 to 1915. In the following year he became Prime Minister. During the War he was defeated

twice on the subject of conscription. He formed a coalition with the Liberals and was again defeated in 1922. In 1923 he was again chosen Premier but was obliged to resign on the defeat of his government later in that year. He was a delegate at the Paris Peace Conference and took a prominent part in the deliberations. See AUSTRALIA.

HULETT, GEORGE AUGUSTUS (1867-). An American chemist, born in Illinois, and educated at Princeton and Leipzig. He was an assistant in chemistry at Princeton, then an instructor at the University of Michigan (1899-1904), and again at Princeton, where in 1909 he became professor of physical chemistry. He was also chief chemist of the Bureau of Mines (1912-13). During the War he was a member of the foreign service commission of the Natural Research Council and visited France and England to study the origin and development of scientific activities in connection with warfare. His original investigations were almost entirely in problems of physical chemistry, e.g. isomorphism in precipitates, occlusions in electrodeposits, and decomposition potentials. He was a member of the United States Assay Commission in 1906.

HULL, CORDELL (1871-). An American public official (see VOL. XI). He served as a member of Congress, 1907-21. From the latter date he was chairman of the Democratic National Committee and was later chairman of the Democratic National Executive Committee. In this capacity he called to order the Democratic national convention of 1924 and was also chairman of the platform committee at that convention.

HULSE, HIRAM RICHARD (1868-). An American bishop, born at Middletown, N. Y., and educated in Philadelphia. After studying theology he was ordained deacon and priest. He was for several years vicar of the Pro-Cathedral in New York and from 1899 to 1912 was rector of St. Mary's Church there. He was also Secretary of the American Church Missionary Society and in 1915 was consecrated bishop of Cuba.

HULSEN, CHRISTIAN K. F. (1858-). A German historian and archæologist. He was born in Berlin and studied at the university under Mommsen. After teaching several years he was appointed director of the German archæological institute in Rome; in 1917 he became honorary professor at Heidelberg. He is the author of *Die Thermen des Caracalla* (1898); *Forum Romanum* (1904); *Topographie der Stadt Rom im Altertum* (1897); *Die Thermen des Agrippa* (1910); *Il Libro di Giuliano di San Gallo* (1910); and *Roms Antikengarten* (1917).

HUMAN EVOLUTION. See ANTHROPOLOGY.

HUMBERT, GEORGES LOUIS (1862-). A French general, born in Gazaran. He entered the army in 1883 and served in Indo-China, Madagascar, and other French colonies. He was in service in Morocco in 1913 and in 1914 and was placed in command of the Moroccan division at the outbreak of the War. Later in 1914 he commanded the 23d Army Corps. He was given command of the 3d Army in 1915. This post he held for three years, with distinguished success. In 1919 he was made governor of Strassburg and in 1920 a member of the Superior War Council.

HUME, SAMUEL JAMES (1885-). A dramatic director and producer, born in San Francisco, Cal., and educated at California and Harvard Universities. He organized the first exhibition of stagecraft in the United States in 1914 and exhibited in Boston, New York, Chicago, Detroit, and Cleveland. In 1918 he became assistant professor of dramatic literature and art at the University of California and directed the Greek Theatre there. He is also interested in pageant and masque productions.

HUNEKER, JAMES GIBBONS (1860-1921). An American musical and literary critic (see VOL. XI). In 1921 he published *Steeplejack*, largely autobiographical. His death cost American letters one of its most discerning critics whose large and contagious enthusiasms succeeded, more than any other single force, in familiarizing Americans with modern European artistic movements. He was one of the first to write of Gauguin, Ibsen, Wagner, Nietzsche, France, Faguet, Van Gogh, and George Moore. In this sense possibly he was only a reporter, but he reported the advent of new genius with discrimination, a rare gift.

HUNGARIAN LITERATURE. The great events of the decade 1914-24 did not much influence the literature of Hungary, as that country acted always a rather passive part in European politics. As no Hungarian felt enthusiasm for the War and nobody surmised the tragic end fate prepared for the old kingdom, the national literature of the Hungarians continued its course of natural evolution even during the great cataclysm. Literary production grew continuously and the people were willing to pay hundreds of thousands of their depreciated crowns for a good book. During the last years, as was to be foreseen, modern tendencies became prevalent. Tradition and political conditions had created for centuries a retrospective seclusion of Hungarian literature. On the eve of the new century a small group of young poets and writers, all admirers of the great western nations, revolted against the old traditions. The very title of their magazine *Nyugat* (The West) expresses their programme. Amid the great contest of national and human ideas they were fighting on humanity's side, but after their victory they were again returning to a sound and sober nationalism. The representatives of the old school, some of them fed at the breast of classicism, but finally growing into a languishing triviality, were slowly dying out. The young authors revived the whole literature, filled it with strength, added very much to the treasury of language and were refining all styles of writing from classical down to the futurist. Among the modern poets, Endre Ady (1877-1919) representing lyric poetry, was the most prominent. A staunch admirer of the French "decadents," he learned their affectation in showing a neglect of the forms while, in fact, they were bringing these same forms to perfection. Many of his poems are of permanent value. Mihály Babits was the most sensible, most erudite, and perhaps the greatest living poet of Hungary. His translation of Dante's *Divina Commedia* is unsurpassed. Dezső Kosztolányi was also a great master of his art, and a soul of very deep feeling. His *Complaints of a Poor Little Child* is on a level with the best creations of modern poetry. Being a keen philologist, he translated many American, English, French, German, Ital-

ian, and Spanish poems into Hungarian (*Modern Poets*, 3 vols., 1922). Among the other lyric poets, Gyula Juhász, Simon Kemény and Árpád Tóth were most popular. In the field of fiction, after the quarter-century interval of sterility that followed the great novels of Lócai and Mikszáth, Zsigmond Móricz was in the last years of the decade leading a small but vigorous troop of young novelists, the best among them Margit Kaffka, Lajos Biró, Mihály Babits, Dezso Kosztolányi, Aurél Kárpáti, and Miklós Suiányi. In a class by herself was Renée Erdős with her realistic novels: *Cardinal Santerra* is her most admirable work. The modern Hungarian drama already enjoyed a good reputation in the theatrical world. The vigorous, quick action and the finely-spun dialogue, full of life and wit, made some Hungarian dramatists world-famous. Ferenc Molnár's *The Devil, Liliom*, *Fashions for Men*, *The Swan*, Lajos Biró's *Moonflower* and *Highwayman*, Menyhért Lengyel's *Typhoon* and *Sancho Panza* and Ernő Vajda's *Fata Morgana*, were uncommon successes on the American stage, too. Among modern dramatists, not yet known in America, Ferenc Herczeg, Jenő Heltai, and Frigyes Karinthy are to be mentioned. In the scientific literature, two great historical works, Sándor Márki's *Francis Rákóczi II*, and László Erdélyi's *The Period of the Árpád Dynasty*, also Jenő Cholnoky's monumental *Geography of America* and the literary studies of György Király, are achievements of serious value.

HUNGARY. A republic of Europe from Nov. 16, 1918, to Mar. 23, 1920, when the country was declared a monarchy. The throne, however, was vacant. Under the terms of the Treaty of Trianon, the area of Hungary is 35,790 square miles. It is bounded on the north by Czecho-Slovakia, on the east by Rumania and Poland, on the south by Jugo-Slavia, and on the west by Austria. The population, according to the census of 1921, was 7,945,000. The principal cities were Budapest with a population of 1,194,616; Szeged, 110,000; and Debreczen, 103,000.

Agriculture. Hungary was chiefly an agricultural country. The acreage and yield of the principal crops for 1923 was as follows:

Commodity	Area (acres)	Yield (metric tons)
Wheat	3,478,150	1,841,880
Rye	1,682,087	815,660
Barley	1,198,657	536,660
Oats	872,763	379,320
Corn	2,513,983	1,401,100
Potatoes	649,988	1,715,800
Sugar beets	137,355	881,500

According to the census of 1920, the live stock was as follows: horses, 746,423; cattle, 2,221,988; sheep, 1,817,405; pigs, 3,729,190.

Commerce. According to figures published in 1924, the trade balance for 1923 showed an excess of imports over exports of 80.4 million gold crowns as compared with an adverse balance of 214 million gold crowns in 1922. While details for the 1923 trade were not available, the 1922 figures showed imports of 166 billion paper crowns and exports of 91 billion paper crowns, or an adverse balance of 75 billion crowns, which is estimated at 214 million gold crowns. The chief items entering into the 1922 figures were as follows (in millions of paper crowns): wheat and rye flour, 18,000; wine, 3600; fruit,

880; vegetables, 924; grain, 1530, food products, 20,800.

The chief countries of destination of Hungarian goods in the order of importance were Austria, Czecho-Slovakia, Rumania, Jugo-Slavia, Germany, Italy, and Switzerland. Hungarian imports were drawn principally from Austria, Czecho-Slovakia, Germany, Rumania, Poland, Great Britain, and Italy.

Mining and Manufacturing. The Hungarian production of coal in 1922 totaled 741,000 tons of bituminous and 5,615,000 tons of brown coal. The chief Hungarian industries were those that were allied with the agricultural resources of the country and consisted of grain mills, distilleries, sugar refineries, and plants for the manufacture of hemp and flax. Some iron and steel was produced.

Transportation. The total length of Hungarian railways in 1922 was 4493 miles, of which 1858 were owned by the state. Of the total railways, 598 miles were of double track.

Finance. Figures on Hungary's national debt were difficult to obtain. Considerable confusion existed as to Austria's share of the debts of the old Austro-Hungarian Monarchy, and until this question could be cleared up no definite figures were possible. The rapid depreciation of the Hungarian crown, which occurred throughout 1922 and 1923, made it impossible accurately to estimate the amount of government revenue and expenditure. The budget for the fiscal year 1922-23 (June 30, 1922, to July 1, 1923,) estimated expenditures at 193,000,000,000 paper crowns and revenues at 153,000,000,000 paper crowns, or a deficit of 40,000,000,000 crowns. Inasmuch as this budget was not presented until the eighth month of the budget year, and since exchange fluctuated considerably in the meantime, any conversion into stable values would be misleading. During 1921 and 1922 and the early months of 1923, the Hungarian crown, except for occasional periods of stability, declined steadily. At no time, however, were fluctuations as violent as in the summer of 1923, when the crown fell from 0.0118 cent to 0.0039 cent in less than two weeks. Foreign exchange quotations for the Hungarian crown stood at 0.0409 on Jan. 1, 1923; at 0.0052 cent on December 31; and at 0.0013 cent on Mar. 15, 1924. The statement of the Royal National Bank of Hungary of Dec. 23, 1923, showed a total note circulation of 901,000,000,000 paper crowns as compared with 75,000,000,000 paper crowns on Dec. 31, 1922. The metal reserve of the bank, consisting of gold coin and gold bullion, and foreign currencies and securities, amounted to 22,800,000 gold crowns. Silver and other currency totaled 595,674 gold crowns. On Dec. 31, 1922, the metal reserve amounted to 16,000,000,000 paper crowns.

Economic Conditions. Throughout 1923 the cost of living rose steadily. On the basis of 100 for 1913, the general average cost of living index figure for Oct. 31, 1923, was 410,520, as against 48,516 on Mar. 31, 1923, and 25,624 on Dec. 31, 1922. As a result primarily of the rapid depreciation of the foreign exchange value of the crown, the second half of the year 1923 was marked by disorganization both in business and in finance. The principal causes of the decline were the inability of the government to balance its budget and the heavily adverse balance of trade. In order to meet these conditions the government was obliged to resort to

note inflation Thanks to Hungary's agricultural character, however, the effects on trade and industry of currency depreciation were less severe than in the case of Germany and Poland. As a matter of fact, many industries, notably the cotton wool and silk industries, were temporarily stimulated by increased foreign and domestic demand. Internal buying was largely of a speculative character and contributed to a great extent to the sharp increases in living costs which followed the decline in exchange. The most important development during 1923 was the application made to the Reparations Commission by the Hungarian government for an international loan for the purpose of rehabilitating the country's finances. The plan, which was accepted by the Hungarian government, provided for a loan of \$50,000,000 to be repaid over a period of 20 years; amortization and interest charges to be met from receipts from monopolies and other sources. The plan also granted a moratorium of two years on reparations payments. At the expiration of this period Hungary would be required to pay \$2,000,000 a year for 20 years on account of reparations. In consideration of this loan, Hungary agreed to discontinue the policy of note inflation; to establish a new bank of issue independent of the state; to balance its budget by June 30, 1926; and to place the railways and other state institutions on a self-supporting basis. The plan also called for a financial supervision by the League of Nations similar to that of Austria.

History. Under the government of Count Tisza, Hungary participated in the conduct of the War, unquestioningly as far as the Magyars were concerned, but with reluctance by the other nationals. The death of the aged Emperor (Nov. 21, 1916) loosed all those dissident forces which had yielded only a reluctant allegiance. The independent spirit of the Prime Minister quickly antagonized the new King, who, listening to the counsels of the court cabal, dismissed Tisza in May, 1917. Weaker men assumed control, with the result that the country was rent by political dissensions. Count Esterhazy became premier for a time but was soon succeeded by Herr Wekerle. The agitation over the extension of the political franchise attracted attention away from more pressing concerns, with the result that the hardships of the civil population increased with the failure of the government to buy up the harvests, etc. All the familiar customs were now to go down before the new revolutionary spirit that gripped the Hungarian people as the War dragged on. The demand for reform became increasingly insistent and gained importance from the personal prestige of Count Karolyi who had assumed leadership of the forces of discontent. His hand was strengthened by the royal manifesto of Oct. 16, 1918, which was tantamount to a dissolution of the Dual Monarchy. Thenceforth Hungary went her separate way. Believing that Karolyi was in a position to gain more favorable terms from the Allies, Hungarian statesmen yielded to his advice and on Oct. 25, 1918, formed a National Council. Five days later Karolyi was summoned to head it as minister-president. In accordance with his liberal, nay, republican professions, he recalled the Hungarian troops from the front and viewed with complacency the formation of workers' and soldiers' councils in Budapest. The revolution

took a more violent character when, on October 30, Count Tisza, the leading representative of the old régime, was killed. On November 10, the National Council proclaimed Hungary a republic: on Jan. 11, 1919, it elected Karolyi provisional president. Karolyi's hopes that his anti-war and republican sentiments might serve to gain more favorable peace terms for Hungary received a rude check when a new armistice deprived Hungary of large territories in favor of Rumania and Serbia. This setback, the invasion of Hungarian lands by Rumanian and Czech troops, the increasing war-weariness that made any régime other than the one in power desirable, the growing turbulence of the workers, and the example of the successful Russian Revolution, united to undermine the government. Karolyi, with more prudence than courage, yielded up his post, and on Mar. 22, 1919, Hungary became a Soviet Republic dominated by an alliance between the Social Democrats and the Communists, the only well organized parties.

From March 22 to August 1, the doctrine of the dictatorship of the proletariat ruled the distracted country. Alexander Garbai became president of the Republic, though the actual ruler was Béla Kun, commissary for foreign affairs, and friend of Trotsky and Lenin. Other leaders were Szamuely, Pogany, Böhm, and Varga. Initial measures were rigorous. The revolutionary government council proclaimed the socialization of large properties, mines, industries, banks, and other commercial institutions. All ranks and titles were abolished and church and state separated. A strict censorship of the press was imposed. Money was sent into Vienna in an attempt to spread the Bolshevik propaganda there. The middleman was singled out for attack; all raw materials were made a state monopoly. For the conciliation of the peasantry, private property in holdings of 100 acres or less was permitted. The career of the Soviet Republic was short. The closing of the factories for want of materials stirred the workers into hostility, while the persecutions of the church and the placement of Jews in high offices antagonized the devout peasants. The nobility was naturally embittered and intrigues soon led to the formation of a counter-government with an army recruited by Vice-Admiral Horthy. Béla Kun's failure to come to an understanding with the Supreme Council's representative, General Smuts, and his policy of militant opposition to Hungary's enemies, hastened his downfall. His Red Army was soon at war with the troops of Rumania, Jugo-Slavia, and Czecho-Slovakia. An initial victory against the Czechs brought down the wrath of the Supreme Council on Béla Kun, and Hungary was threatened with military and economic reprisals. To conciliate the Peace Conference, Béla Kun withdrew his forces from the conquered Slovak territory, only to be confronted by an advancing Rumanian army on the east. Resistance was useless; the Rumanians advanced on the capital with the tacit consent of the Allies, and beset by obstacles everywhere, the Soviet government resigned and took refuge in flight, finding a haven first in Vienna and later in Russia.

A White government, except for a brief interval, now succeeded the Reds. As a result of the intercession of the Allies, a moderate Social Democratic government was at once overthrown on August 7, and the reactionary Archduke

Joseph was set up as regent of the state with Herr S. Friedrich as premier. All interest was diverted from internal affairs in the face of the advancing Rumanian army. On August 3, after having pillaged the countryside, the Rumanians entered the suburbs of Budapest; on August 5, against the injunction of the Supreme Council, the army took the city; on August 6, an ultimatum was served on the Hungarians demanding 30 per cent of the harvest, farm animals, and farm tools, 50 per cent of the rolling stock, and the equipment for an army of 300,000 men. Not until after they had stripped the country bare did the Rumanians yield to the reiterated remonstrances of the Allied Supreme Council and quit the capital, November 11, and the country entirely, February, 1920. Meanwhile, reaction was in the saddle. Archduke Joseph, at the order of the Allies, was compelled to quit the regency only to be succeeded by the virtual rule of Admiral Horthy backed by his White army. For a time Friedrich stayed on as premier; he was succeeded for another brief period by Herr K. Huzzár. A rapid succession of ministers during 1920-21 availed the country nothing in view of the economic demoralization, the hostility of her neighbors, and the loss of the rich agricultural territories of the Banat, the Bačka and the Little Alföld.

On Jan. 25, 1920, a general election chose delegates to the National Assembly. Hostility toward the Socialists accounted for heavy victories for the parties of the Right. In March, Admiral Horthy was formally chosen regent, the step being dictated by the antagonism of the Little Entente toward the creation of a monarchy. An indication of the bitterness of the reaction was revealed in the obstructions placed in the way of the trade unions' participation in politics. To lift such discriminations, the International Federation of Trade Unions ordered an economic boycott against Hungary and Hungarians retaliated by boycotting Austria. Demonstrations against the Jews occurred frequently and even the government participated by restricting the number of Jewish students in the universities. Monarchist sentiment continued to prevail, and on Mar. 26, 1921, believing that the country favored his accession, the ex-King Charles (q.v.) suddenly appeared, to ascend the throne. The regent refused to countenance his restoration, with the result that Charles left for Switzerland, only once more to appear in Hungary on October 22. The hostility of the Little Entente again proved disastrous for his hopes, with the result that Charles was compelled to surrender himself to the British and suffer internment on the island of Madeira which he reached November 19, and where he died, Apr. 1, 1922, of pneumonia.

The international situation, possibly more than any other single factor, contributed to the prevailing hopeless temper. On June 4, 1920, a Hungarian peace delegation, of which Count Albert Apponyi was the chief, was compelled to sign away, by the Treaty of the Trianon, at least two-thirds of the former Hungarian kingdom to the new succession states. Hungarian groups were left in Czecho-Slovak, Jugo-Slav, and Rumanian districts, while the new frontiers cut across railways, roads, waterways, and long-established administrative units. In the Bačka and the Banat, rich maize and wheat lands were lost, and in the Little Alföld north of the Danube, barley and sugar-beet fields, and

pastures. With the cession of the Carpathian and Transylvanian country, Hungary saw taken from her all her salt deposits, four-fifths of her iron ore and many coal fields, as well as her sources of water power and a large share of her valuable forests. The continued hostility of the Little Entente prevented the formulation of an economic accord between Hungary and those territories upon which her industries so much depended. In August, 1921, Hungary's burdens were increased by the cession of the Burgenland to Austria, at the bidding of the Allies.

The events of 1922 and 1923 proved how profoundly Hungary was shaken by its unhappy economic and political status. The republic was continually being threatened by the agitations of the royalists, headed by Counts Andrássy and Apponyi, who proclaimed Prince Otto heir to the throne after the death of Charles Horthy, quite as reactionary as the royalists, attempted to reduce the electorate by one-fourth, and to substitute open voting for secret. A rigorous censorship of the press was maintained which applied, too, to the publication and circulation of the writings of such men as Marx, Lenin, and Walt Whitman. A move was originated for the practical suppression of the civil liberties, its purpose being the imprisonment or banishment of all those suspected of questioning the prevailing political, economic and religious beliefs. Two disturbing factors were also evident in 1923: that the courts had become the mere instruments of the authorities and that conscription had been practically restored. The populace was daily irritated by the presence of the Inter-Allied Commission of Military Control which was being maintained at Hungary's expense. Anti-Semitism was on the increase and Hungarian Fascists were being recruited. Nothing indicated better the broken morale of the people than the ease with which lawless bands incessantly operated. The most powerful, led by one Hejjas, terrorized Jews, trade unionists, and Communists, and led forays into the Burgenland in the summer of 1922. Attempts to suppress them legally were unavailing. Liberals in other countries believed that Hungary had been given over to a "White Terror," characterized by reactionary violence as cruel, perhaps, as any revolutionary terrorism.

The deplorable economic and financial situation resulting from the War and, hardly less, from civil turmoil and territorial transfers after the War, presented so grave an international problem that in December, 1923, at the instance of Czecho-Slovakia, the League Council proposed to undertake the financial rehabilitation of Hungary on a basis similar to that which had proved so successful in Austria. In return for an international loan of 250,000,000 gold crowns, floated under the League's auspices, Hungary was to accept League supervision of her finances, assign to the League the revenue from customs and state monopolies, abide by the terms of the Treaty of Trianon, and pay the war indemnity in 20 annual installments of 10,000,000 gold crowns. Humiliating as they were to Hungarian nationalists, these terms were accepted by Premier Bethlen in February, 1924, and an American banker, Mr. W. P. G. Harding, was invited by the League to act as its Commissioner-General in charge of Hungarian finances. On Mr. Harding's refusal, the post was accepted by Mr. Jeremiah Smith of Boston, who was

cordially received in Budapest, May 1. Meanwhile, despite stubborn Socialist opposition, Premier Bethlen had carried through Parliament, April 18, a series of bills authorizing his government to fulfill the agreement. For Hungary's rôle in Central European politics, see *LITTLE ENTENTE*. For the history of Hungary's lost territories, see *BURGENLAND*, *BANAT*, *TRANSYLVANIA*, *FIUME-ADRIATIC CONTROVERSY*. Also see *HUNGARIAN LITERATURE*.

HUNGERLAND, HEINZ F. W. (1873-). A German writer, born at Bremen and educated at the universities of Greifswald, Göttingen, Kiel, and Münster. He traveled in England and Scandinavia, did some work at the universities of London, Copenhagen, and Lund, and was instructor at Lund. He specialized in Old German language and Old Norse literature. He is the author of *Zeugnisse zur Wolsung- und Nibelungensage aus der Skaldenpoesie* (1903); *Das Wissenschaftliche Studium der Deutschen Sprache* (1906); *Deutschland und die Deutschen* (1913); *Deutsche Marinenymnen* (1911); *Die Weisen aus dem Morgendämmer* (1911); *Siegrunen, Kriegsgedichte* (1915); and *Die Volkshochschule, Deutschlands Rettung* (1919). He also compiled an anthology of Scandinavian lyrics, which he had translated.

HUNSAKER, JEROME C. (1886-). An American airman born in Creston, Iowa, and educated at the Naval Academy and the Massachusetts Institute of Technology. He studied aerodynamics abroad and in 1914-16 was instructor at the Massachusetts Institute of Technology in aeronautical engineering and research in aerodynamics. He translated much of Eiffel's work, including *Resistance of the Air*, and built the first wind tunnel at the Institute where original research was conducted, the results of which were given to builders. Under him, graduate students were trained as aeronautical engineers. Commander Hunsaker was in charge of the aircraft division of the Bureau of Construction and Repair of the Navy Department, 1916-17. He designed the first modern airship produced in the United States as well as the C and D class Navy airships. He also designed the NC flying boats with Westervelt and Richardson. In 1917 he was a member of the joint Army and Navy Technical Board to frame an aircraft programme and in 1918 was attached to the Inter-Allied Naval Armistice Commission. Among his published works are *Stable Biplane Arrangements*; *Aerodynamic Properties of the Triplane*, and *Aéropplane Stability*.

HUNT, CLARA WHITEHILL (1871-). An American librarian, born at Utica, N. Y. She graduated from the New York State Library School in 1898 and for several years taught in the public schools. In 1898 she organized the work with children in the Apprentices' Library in Philadelphia and from that year to 1902 was with the Newark Free Public Library. In 1903 she became superintendent of the Children's Department of the Brooklyn Public Library. She lectured much on library topics and was the author of *What Shall We Read to the Children?* (1915); *About Harriet* (1916); and *The Little House in the Woods* (1918).

HUNT, EDWARD AYRE (1885-). An American sociologist, educated at Harvard. He was engaged in clerical work and as assistant in the Harvard English department, 1910-12. From 1912 to 1914 he was on the editorial staff

of the *American Magazine* and was also well-known correspondent in Europe. From 1914 to 1916 he was American delegate of the Commission of Relief to Belgium in charge of the province of Antwerp. He was a director of publicity for the American Red Cross in 1917 and was head of the economic rehabilitation work of the Red Cross in France in the year following. He served in several other important capacities during the War and in 1920 was a member of the commission on the elimination of waste in industry. In 1921 he acted as secretary of the conference on unemployment. His published writings include *War Bread—A Personal Narrative of the War and Relief in Belgium* (1916); *Tales from a Famished Land* (1918); and *Waste in Industry*, with Herbert Hoover and others (1921).

HUNT, GEORGE WYLEY PAUL (1859-). An American public official and diplomat, born at Huntsville, Mo., and educated in the public schools. For several years he was engaged in ranching in Arizona. In 1893 he was elected a member of the Legislature of that State and of the Senate in 1897 and was reelected for several terms. He was president of the Constitutional Convention (1910) and in 1911 was elected first governor of the State of Arizona. He was reelected for terms from 1915 to 1919 and was meanwhile United States Commissioner of Conciliation to negotiate settlement of the miners' strike in Arizona (1917). In 1920 he served as minister to Siam, resigning in the following year. He was again elected governor of Arizona in 1922.

HUNT, HENRY THOMAS (1878-). An American lawyer, born at Cincinnati, and educated at Yale and the Cincinnati Law School. In the same year he was admitted to the bar. He took an active interest in civic and State politics and was a member of the Ohio House of Representatives, 1906-07. From 1908 to 1911 he was prosecuting attorney of Hamilton County and was mayor of Cincinnati from 1912 to 1914. He was active in securing elective reforms in municipal and State government. During the War he served in France and as a member of the War Department Claims Board in Washington. In 1920-21 he was a member of the Railroad Labor Board.

HUNT, THOMAS FORSYTH (1862-). An American agriculturist, born at Ridott, Ill., and educated at the University of Illinois. After serving as assistant to the Illinois State entomologist, he became assistant in agriculture at the University of Illinois in 1886, and from 1888 to 1891 was assistant agriculturist for the Illinois Agricultural Experiment Station. He was on the faculty of the Pennsylvania State College as professor of agriculture, 1891-92, and became in 1892 professor of agriculture at the Ohio State University, where from 1896 to 1903 he was dean of the College of Agriculture and Domestic Science. He was professor of agronomy at Cornell University from 1903 to 1907 and dean of the School of Agriculture and director of the Pennsylvania Agricultural Experiment Station of the Pennsylvania State College from 1907 to 1912. In the latter year he became professor of agriculture and dean of the College of Agriculture at the University of California. Until 1919 he was also director of the Agricultural Experiment Station at that university. Professor Hunt wrote: *History of Agriculture and Rural Economics* (1899);

How to Choose a Farm (1906); and *Farm Animals*, with Charles W. Burkett (1917).

HUNTER, GEORGE LELAND (1867-). An American art authority (see Vol. XI). During the period he published *Inside the House That Jack Built* (1914); *Italian Furniture and Interiors* (1917); and *Decorative Textiles* (1918); and contributed to the magazines many articles on related subjects.

HUNTER, WALTER SAMUEL (1889-). An American psychologist, born at Decatur, Ill., and educated at the universities of Texas and Chicago. He taught at the University of Texas from 1912 to 1916 and after 1916 at the University of Kansas. In 1916 he became associate editor of the *Psychological Bulletin*. He was the author of various studies in animal behavior, space perception, and social psychology. His best known work is his textbook, *General Psychology* (1919).

HUNTER, WILES ROBERT (1874-). An American social worker, born at Terre Haute, Ind., and educated at the University of Indiana. He was for several years an official of the Chicago Bureau of Charities and a resident at Hull House from 1899 to 1902. After doing settlement work in England, he became head worker at the University Settlement of New York City in 1902 and served for one year. From 1902 to 1906 he was chairman of the New York Child Labor Committee. He was president of the Berkeley Commission of Public Charities in 1921. His books include: *Tenement Conditions in Chicago* (1901); *Poverty* (1904); *Violence and the Labor Movement* (1914); *Labor and Politics* (1915); and *Why We Fail as Christians* (1919). In 1918 he became lecturer on economics and English at the University of California.

HUNTER, WILLIAM (1861-). A British physician, credited by the English with priority in the recognition of buccal infection (oral sepsis) as an extensive cause of disease (neuritis, anæmia, etc.). His announcement of this doctrine appeared in 1901, years before that of Billings and others in the United States. After studying at the University of Edinburgh, he spent several years as a research student at Cambridge. He then became associated with Charing Cross Hospital and was dean of the medical school there, 1910-15. He was also physician to the London Fever Hospital and in 1915 was sent by the British Government to Serbia to study the epidemics of typhus and relapsing fever. His major writings comprise *Pernicious Anæmia* (1901), expanded in 1909 to *Severest Anæmias*, the second volume of which had not yet been published in 1924. He also wrote *Historical Account of Charing Cross Hospital and Medical School* (1914).

HUNTER COLLEGE OF THE CITY OF NEW YORK. A college of liberal arts established in 1870 for the education of women. The student enrollment increased from 1400 in 1915 to 1514 in 1924, and the teaching staff from 121 to 124 members. A summer session was established in 1916 which in 1923 had 894 students and a faculty of 55 members. In the year following evening and extension sessions were established which enrolled 3265 students and 110 members of the faculty in 1924; in 1921 courses leading to the A.M. degree were offered in this division. The name of the college was changed in April, 1914, from Normal College of the City of New York to the

title given above. President, George Samler Davis, LL.D.

HUNTING, GEORGE COOLIDGE (1871-1924). An American bishop, born at Milwaukee. He studied theology at the Virginia Theological Seminary and was ordained deacon of the Protestant Episcopal Church in 1894 and priest in 1897. For several years he was engaged in missionary work in Nevada and Utah and from 1899 to 1902 was rector of St. Paul's Church at Evanston, Wyo. For the five years following he was superintendent and chaplain at St. Mark's Hospital at Salt Lake City and again engaged in missionary work until 1914, when he was consecrated bishop of Nevada. From 1909 to 1911 he was editor of *The Nevada Churchman*.

HUNTINGTON, EDWARD VERMILYE (1874-). An American mathematician, born at Clinton, N. Y., and educated at Harvard and in Europe. He was instructor in mathematics at Harvard, 1895-97, and held a similar place at Williams College during 1897-99. In 1901 he went to Harvard, where he became in 1919 professor of mechanics. During 1918-19 he was engaged in statistical work for the General Staff with the rank of major. His scientific work has had to do with various systems of postulates forming the bases of elementary mathematical theories. He was editor of *Annals of Mathematics* during 1902-11 and was president in 1918 of the Mathematical Association of America. In addition to editing various scientific memoirs and works, he is known as author of *Four Place Tables of Logarithms and Trigonometric Functions* (1907), *The Fundamental Propositions in Algebra*, the fourth in *Young's Mathematical Monographs* (1911), *Essentials of Elementary Dynamics* (1916), *The Continuum and other Types of Serial Order* (1917), and *Handbook of Mathematics for Beginners* (1918).

HUNTINGTON, ELLSWORTH (1876-). An American geographer and educator (see Vol. XI). From 1910 to 1915 he was assistant professor of geography at Yale and from 1917 was research associate. During the War he served as captain of the Military Intelligence Division. His later books include *The Climatic Factor* (1914); *Civilization and Climate* (1915); *World Power and Evolution* (1919); *The Red Man's Continent* (1919); and *Principles of Human Geography*, with S. W. Cushing (1920).

HURLBUT, JESSE LYMAN (1843-). An American clergyman and writer (see Vol. XI).

His later books include *Traveling in the Holy Land through the Stereoscope* (1913); *Hurlbut's Story of Jesus* (1915); *Story of the Christian Church* (1918); and *The Story of Chautauqua* (1921).

HURLEY, EDWARD NASH (1864-). An American public official, born in Galesburg, Ill. He was educated in the public schools of Chicago. He served as engineer and traveling salesman for several companies and organized and developed the pneumatic tool industry in the United States and Europe. From 1908 to 1915 he was president of the Hurley Machine Company of Chicago. In 1913 he was appointed trade commissioner to the Latin-American republics and served as vice-chairman and later as chairman of the Trade Commission until 1917, when he was appointed chairman of the United States Shipping Board and president of the Emergency Fleet Corporation. This post

he resigned in 1919. He wrote *The Awakening of Business* (1916) and *The New Merchant Marine* (1920).

HURST, FANNY (1889-). An American author, born in St. Louis, and educated at Washington and Columbia Universities. She early applied herself to a study of the technique and subject matter of fiction. Her short stories made an immediate popular success. They were ingenious in theme, though the characters as a rule were sentimentalized. Jewish life in America was her most usual subject. These short stories, collected in book form, included *Gaslight Sonatas* (1916); *Humoresque* (1918); and *The Vertical City* (1921). An early novel, *Star Dust* (1919), won little attention. Her *Lummoa* (1923) at once raised Miss Hurst to the front rank of American fictionists. Undoubtedly showing the influence of May Sinclair in the terseness with which plot-outlines and characters were sketched, as well as that of "expressionism" with its half-hinted and at times symbolical phrasing, *Lummoa* nevertheless presents the working of a mature and confident mind.

HUSE, HARRY MCLAREN PINCKNEY (1858-). An American naval officer, born at West Point, N. Y. He graduated from the United States Naval Academy in 1878 and was appointed ensign in 1882. In 1905 he served as professor of mathematics at Annapolis and was promoted to be commander in 1907, captain in 1909, and rear-admiral in 1916. In 1919 he served as commander of the Atlantic Fleet Train and was on special duty in London and Paris. In 1920 he commanded the United States naval forces in European waters, with the rank of vice-admiral and after 1921 was a member of the General Board of the Navy.

HUSSEIN IBN ALI (1856-). First King of the Hedjaz. He belonged to the family of the Katada in which the sherifate of Mecca has been vested for eight centuries. He was recognized by the Mohammedans as senior descendant of Mohammed. From 1890 to 1908 he was a prisoner at Constantinople, where he gave his four sons, Ali, Abdullah, Feisal, and their half-brother Zeid, a modern education. After the Turkish revolution of 1918, he was appointed Grand Sherif of Mecca, and gained great influence over the Arab troops. He refused to proclaim a Holy War on behalf of Germany and was invited by societies in Syria and Mesopotamia to lead an Arab revolt. He subsequently took the side of the Allies and rendered efficient service with the British troops in Arabia and Mesopotamia. In recognition of these services, he was proclaimed King of the Hedjaz on Oct. 29, 1916. He vigorously set himself to organize his new kingdom, which was recognized by all the Allied Powers. With the assistance of Great Britain, he established and maintained a well organized government. See CALIPHATE.

HUSSEY, WILLIAM JOSEPH (1862-1926). An American astronomer, born at Mendon, Ohio, and educated at the University of Michigan. During 1884-89 he was principal of various schools in Ohio and Illinois and in 1889 served as an assistant on *The Nautical Almanac* of Washington. Also in 1889, he went to the University of Michigan as an instructor of mathematics; in 1891, he became acting director of the Detroit Observatory; and a year later went to Stanford University, where in 1894 he became

full professor. During 1896-1905 he was astronomer at the Lick Observatory but in 1905 returned to Michigan where he became professor of astronomy and director of the observatory. Dr. Hussey was director of the Argentina National Observatory at La Plata (1911-17), of the Lick Eclipse Expedition to Egypt in 1905, and of La Plata Eclipse Expedition to Brazil in 1912. He has discovered more than 1600 double stars; in recognition of this achievement he received the Lalande Prize of the French Academy in 1906. He is a foreign associate of the Royal Astronomical Society of Great Britain and a member of other scientific societies, including the Astronomical Society of the Pacific. In addition to many minor contributions to scientific journals he is the author of *Logarithmic and Other Mathematical Tables* (1891, 1895), *Mathematical Theories of Planetary Motions* (1892), and *Micrometrical Observations of the Double Stars Discovered at Pulkowa* (1901).

HUSTON, CHARLES ANDREWS (1876-). An American lawyer and educator, born at Stratford, Ont. After graduating from the University of Chicago he was fellow in political economy there. He served as assistant in English at the University of Chicago and then joined the faculty of Leland Stanford Junior University, where he was successively instructor, assistant professor, associate professor, and professor of law. In 1916 he became dean of the law school. He wrote *Enforcement of Decrees in Equity* (1915) and several articles on legal subjects. In 1917-18 he served with the War Trade Board and the Provost Marshal-general's Department at Washington.

HUTCHESON, ERNEST (1871-). An American pianist, born at Melbourne, Australia. He received his first instruction there from Max Vogrich and was exhibited as a wonder-child at the age of five. After graduating from the Leipzig Conservatory, where he had been a pupil of Reinecke, he studied for some time with Stavenhagen in Weimar. During the next 10 years he devoted himself mainly to teaching. After a successful tour of Germany and Russia in 1900, he came to the United States, where he taught at the Peabody Conservatory in Baltimore until 1912. His second European tour (1912-14), established his reputation as one of the foremost contemporary pianists. At the conclusion of this tour he returned to the United States, making his home in New York.

HUTCHESON, GROTE (1862-). An American soldier, born in Cincinnati, Ohio. He graduated from the United States Naval Academy in 1884 and was commissioned second lieutenant in the same year. He served in the Spanish-American War and in various commands in the Regular Army and became colonel of cavalry in 1916. He was promoted to be major-general of the National Army in 1917. In 1918 he created and organized ports of embarkation at New Port News and Norfolk, Va. He was promoted to be major-general in the same year and brigadier-general in the Regular Army in 1921. He was awarded the Distinguished Service Medal for specially meritorious service in the administration of the Port of Embarkation. He saw service, during his career, against the Indians, and in Porto Rico, China and the Philippines.

HUTIER, OSKAR VON (1857-). A German soldier, born near Erfurt. In the German

advance in France in 1914, he commanded the Prussian Guards and was one of the most aggressive and skillful of the German leaders in that movement. In 1915 he was given command of the 21st Army Corps and in 1917 commanded Army Group D. Later in the same year he was assigned as commander of the 8th Army, and with this occupied Riga. He was transferred to the 18th Army on the western front and took an important part in the great German advance which began in March, 1918.

HUXLEY, ALDOUS (LEONARD) (1894-). An English author, son of Leonard Huxley. He attended Eton and Balliol, Oxford, and soon entered journalism. He wrote first for *The Athenæum* and then for *The Westminster Gazette*. His published works include poems, essays, and novels. The better known were *Limbo* (1920); *Leda* (1920); *On the Margin* (1923); and the novels, *Crome Yellow* (1921), *Mortal Coils* (1922), and *Antic Hay* (1923). Possessed of a lively wit and a feeling for the unusual in character and scene, he attracted attention with each of his published works. His characters were vivid, his situations piquant, and his intelligence mordant and unrelenting.

HYATT, ANNA VAUGHN (1876-). An American sculptor (see Vol. XI). Her able craftsmanship in the sculpture of animal life, consistently evidenced in such later works as "Great Danes," "Colts in a Snowstorm," and "Reaching Jaguars," gave her a foremost position in this field in the United States. Her achievement in the statue of Joan of Arc, Riverside Drive, New York (1915), notable among such for its truth of detail, its simplicity and dignity, turned her interest somewhat toward equestrian subjects, with noteworthy results. Among her awards were the Rodin gold medal, Philadelphia, 1917, and the Saltus gold medal, 1920. She became a member of the American National Academy in 1916, and a chevalier of the Legion of Honor (France), in 1922.

HYDE, CHARLES CHENEY (1873-). An American lawyer, born in Chicago, and educated at Yale University and the Harvard Law School. In 1898 he began practice in Chicago, where he remained until his removal to Washington in 1920. He was a lecturer on diplomacy at the Northwestern University Law School, and from 1908, professor of law and lecturer on international law at Yale University. His several works on international law included *International Law Chiefly as Interpreted and Applied by the United States* (1922).

HYDROAEROPLANE. See AERONAUTICS.

HYDROCARBONS. See CHEMISTRY, ORGANIC.

HYDRO-ELECTRIC STATIONS. See ELECTRIC POWER STATIONS AND GENERATING APPARATUS; WATER POWER; TURBINES; STEAM.

HYDROGEN. See CHEMISTRY.

HYDROGEN ATOM. See PHYSICS.

HYDROPHONE. This name has been applied to any instrument for listening to sounds transmitted through water. Before the War such instruments were used for receiving signals from submerged bells. The hydrophone as usually fitted consisted of a small water-tight box of which one side was a metal diaphragm operating a microphone enclosed in the box. The box itself was suspended in a tank built against the ship's outer plating which formed one side of it. Early in the war attempts were made to use some form of hydrophone for detecting the presence of vessels (particularly submarines) within sound range of their internal machinery or propellers. For some time no great success was attained but the effectiveness of listening devices was materially improved. Several fish-shaped hydrophones, 12 feet apart, towed astern and electrically connected for receiving the sound on board the vessel, gave fair results; but the Walzer hydrophone (the invention of a French naval officer), which attained its final form early in 1918, is said to have given greater satisfaction and was much used after March of that year. The receiving diaphragms were arranged at regular intervals over the surface of a hemispherical bulge built into the hull on each side towards the bows. The system acted as a sound lens, the sound focus occurring at a point where the sound paths by alternate routes were equal. From the results received the direction of the source of sound could be calculated.

HYLAN, JOHN F. (1868-). An American public official, born at Hunter, Greene Co., N. Y. He was educated in the public schools and engaged in various occupations in New York City. He graduated from the New York Law School in 1897 and in the same year was admitted to the bar. From 1906 to 1914 he was city magistrate and in 1914-15, judge of the county court. Mr. Hylan became mayor of New York City in 1918 and was reelected in 1922 for the term ending 1925.

HYTHE CONFERENCE. See REPARATIONS.

HYVERNAT (EUGÈNE XAVIER LOUIS) HENRY (1858-). A French Orientalist. He studied at Lyons, Paris, and the Pontifical University of Rome. He was professor-interpreter of Oriental languages for propaganda and professor of Assyriology and Egyptology in Rome, 1885-89, and in 1889 went on a scientific mission to Armenia for the French government. He then came to America as professor of Oriental languages and archaeology at the Catholic University. He is the author of *Les Actes des Martyres de l'Égypte* (1886), *Du Caucase au Golfe Persique* (1892), and *A Check List of Coptic Manuscripts in the Pierpont Morgan Library* (1919). He is a contributor to American, British, French, and German reviews.

I

IBAÑEZ, BLASCO. See **BLASCO IBAÑEZ, VICENTE.**

IBSEN, SIGURD (1859-). A Norwegian statesman and author (see Vol. XI). His later works include *Robert Frank* (1914) and *Tempel der Erinnerung* (1918), both of them translated into German.

ICELAND. An island in the North Atlantic, formerly a Danish possession, but since 1918 a separate kingdom united to Denmark under a single crown. Its area is estimated at 39,709 square miles, and its population (1920) at 94,679, making a density of 2.4 per square mile. The 1910 population was 85,183. Of the 1920 population, 54,246 lived in rural districts, and the rest in towns of over 300. Except for 706, it was entirely native born. The capital city, Reykjavik, had (1920) 17,678 inhabitants. Besides this, there were six other towns with a total population of 11,377. Only one quarter of one per cent of the land is under cultivation, mainly in hay, potatoes, and turnips. In 1921 the crops were hay, 2,800,000 cwt., potatoes, 33,000; turnips, 13,000. Live stock showed a little increase over the preceding decade, with a 1921 figure of 49,300 horses, 23,700 cattle, 554,000 sheep, and 554,000 goats. In 1918, the total value of the fisheries, the most important single industry, was 30,570,000 krónur (about \$9,415,000), of which the cod catch alone was valued at 27,720,000 krónur. There was little manufacturing, although Iceland has great potentialities because of its innumerable waterfalls. In 1919, exports were valued at 75,013,584 krónur (about \$20,000,000). In 1910 they were \$4,000,000. Imports were put at 62,565,532 krónur (about \$18,000,000). In 1910 they were \$3,000,000. In 1919, as before, Great Britain and Denmark were Iceland's leading trade factors; the United States was a very close third, with 16,503,518 krónur imports coming thence. The 1923 budget estimate listed revenues at 7,813,450 krónur and expenditures at 7,922,329 krónur. The largest charges were for communications, 1,940,540 krónur; for instruction, 1,305,188 krónur. At the beginning of 1922, the public debt was 16,385,525 krónur, held for the most part in Denmark. There are no railroads, but there were 320 miles of carriage roads in excellent repair. In 1922, 42 steam vessels of 7456 tons were flying the Icelandic flag.

History. By the Act of Union of Nov. 30, 1918, Iceland was granted home rule under the Danish crown. Complete sovereignty was vested in the home government; foreign affairs alone were to be the charge of the Danish government until 1940. Iceland's perpetual neutrality was established, and no armed force or fortifications were permitted her. Danish goods in Iceland and Icelandic goods in Denmark were to receive no more consideration than the products of other countries. By the

new constitution promulgated in 1920, the executive power rests in the King through a responsible ministry of three, the chief of which is the president of the council; the legislative power resides in a bicameral house (*Althing*). The lower chamber is elected by universal manhood and womanhood suffrage, the upper, of 14 members, is chosen, six by proportional representation at large, and eight by the lower house. All bills must be sent to Denmark for the King's approval. At the head of the local judicial system is the Supreme Court stationed at Reykjavik; this is the court of last appeal. Complete prohibition of the import and sale of liquors containing more than 2½ per cent alcohol has been in force since 1912.

IDAHO. Idaho is the twelfth State in size (83,888 square miles) and the forty-second in population; capital, Boise. The population increased from 325,594 in 1910 to 431,866 in 1920, a gain of 32.6 per cent. The white population rose from 319,221 to 425,668; Japanese, from 1363 to 1569; and native white, from 278,794 to 386,705; while the foreign-born white population showed a decrease from 40,427 to 38,963, the Indian from 3488 to 3098, and the Chinese from 858 to 585. The urban population mounted from 68,898 to 119,037; the rural population, from 255,696 to 312,829. The chief cities of the State are Boise and Pocatello. The former grew from 17,358 to 21,393; and the latter from 9110 to 15,001.

Agriculture. While the population of the State increased 32.6 per cent in the decade 1910-20, the number of farms increased 36.7 per cent (from 30,807 to 42,106); while the acreage of land in farms rose from 5,283,604 to 8,375,873, and the improved land in farms from 2,778,740 acres to 4,511,680. The total value of farm property showed an apparent increase, from \$305,317,185 in 1910 to \$716,137,910 in 1920, and the average value of farms from \$9911 to \$17,008. In interpreting these values, however, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes in 1910 was 9.9; in 1920, 15.7. The percentage of improved land in farms increased from 52.6 to 53.9. White farmers in 1920 numbered 41,598 (35,284 native-born), compared with 30,402 in 1910; foreign born farmers numbered 6314, compared with 5708. Farms free from mortgage numbered, in 1920, 11,872; 17,933 in 1910. Those under mortgage in 1920 numbered 20,060, compared with 9010 in 1910; the change was due to the agricultural depression following the War. Of the 42,106 farms in 1920, 34,647 were operated by owners as compared with 27,169 in 1910; 758 by managers, compared with 450 and 6701 by tenants,

compared with 3188. The area under irrigation had increased from 1,430,848 acres in 1909 to 2,488,806 in 1919. The total number of cattle on farms in 1920 was 714,903; in 1910, 404,518. Sheep numbered 2,356,270 in 1920, compared with 2,110,330 in 1910. Dairy cattle in 1920 numbered 202,391. The estimated production of the chief farm crops of 1923 was: corn, 2,648,000 bushels; wheat, 30,115,000 bushels; oats, 7,834,000 bushels; barley, 3,540,000; potatoes, 11,733,000; hay, 2,990,000 tons; and sugar beets, 384,000. Comparative figures for 1913 are: corn, 448,000 bushels; wheat, 14,094,000; oats, 15,112,000; barley, 7,560,000; potatoes, 5,780,000; and hay, 2,044,000 tons. Apple trees of bearing age numbered 1,005,668 in 1910 and 2,380,523 in 1920. In 1909, 659,959 bushels of apples were grown; in 1919, 3,645,640.

Mining. Idaho is one of the important mineral-producing States, especially for its metal mining. The products in the order of their value are lead, silver, gold, and stone. In addition there is produced copper, sand and gravel, and a small amount of zinc. The condition of the mining industry in the decade 1914-24 is shown by the following comparison of production for several years. 1914, lead, 348,526,069 pounds, valued at \$13,592,517; silver, 12,479,516 ounces, \$6,901,172; gold, \$1,152,315; zinc, 42,012,435 pounds: 1917, lead, 393,559,521 pounds; silver, 12,029,338 fine ounces; gold, \$804,809; zinc, 79,854,136 pounds; 1920, lead, 249,609,976 pounds; silver, 7,326,794 fine ounces; gold, \$485,590; zinc, 27,932,326 pounds; 1922, lead, 195,834,205 pounds, \$10,770,881; silver, 6,081,865 ounces; gold, \$501,405; zinc, 4,109,131 pounds, \$234,220. A considerable amount of copper is produced; the output, in 1922, was 3,282,842 pounds, compared with 2,538,396 pounds in 1920 and 6,445,187 pounds in 1914. Since the beginning of mining in Idaho in 1860, mineral products to the value of more than \$925,000,000 have been obtained. In addition to those already mentioned, there have been produced antimony, bismuth, tungsten, cobalt, nickel, molybdenum, mica, asbestos, and coal. The total value of the mineral products in 1921 was \$16,502,273, compared with \$32,449,783 in 1920, \$19,044,567 in 1919, \$36,872,270 in 1918, and \$24,913,223 in 1914.

Manufactures. Idaho is not an important manufacturing State, although its industries have increased considerably in number and in value of products since 1909. There are only two cities having a population of more than 10,000, Boise and Pocatello. These cities, with 8.4 per cent of the total population of the State, reported, in 1919, 11.4 per cent of the total value of products. The number of establishments in the State in 1909 was 725; 1914, 698, and 1919, 922; persons engaged in manufacture, 9909, 10,529, and 16,268; while the capital invested was \$32,476,749, \$44,960,489, and \$96,061,709, in those years. The value of the products rose from \$22,399,960 in 1909 to \$28,453,797 in 1914, and in 1919 to \$80,510,749; but this increase was chiefly due to the change in industrial conditions brought about by the War, and therefore cannot be used to measure the growth of manufactures between the industrial censuses in 1914 and 1919. The increase in number of persons engaged in manufacture, and in the number of manufacturing establishments, however, indicates a large increase in the in-

dustrial activities of the State. The chief products in point of value are those from the manufacture of lumber and timber, which in 1909 were valued at \$10,689,000, 1914, \$13,320,000, and 1919, \$30,643,000. Flour-mill and grist-mill products rank second, in 1909, amounting to \$2,480,000, 1914, \$3,396,000, and in 1919, \$13,501,000. Car construction and repair, in third place, had a production valued at \$1,366,000 in 1909; \$2,034,000 in 1914, and \$4,402,000 in 1919.

Education. Idaho has always been in the forefront of the States in educational progress. In 1912 a constitutional amendment was adopted which established the so-called Idaho System. This, in brief, provided for unity in the educational system; it established a State Board of Education which has charge of both the higher institutions and the public schools. The school code of 1913 provided that the State Board of Education should consist of five members appointed by the governor. This board was made also the board of regents of the universities, board of trustees for the normal schools, the Technical Institute, the School for the Deaf and Blind, and the Industrial Training School, and had general charge of the entire public school system. It has since been made also the State Board for Vocational Education. This system had admirable results from the year in which it was inaugurated, and during the decade still further advances were made. One of the most important of these was in 1917, when it was provided that thereafter candidates for the teaching profession must have completed courses in one of the high schools of the State, or have equivalent education, and must have had at least some professional training before being certified to teach. The Legislature of 1923 passed several important measures affecting education, among them one abolishing county institutes and several amending the tax laws relating to education. One of the most notable features of the decade was the growth of the Technical Institutes. Under the cooperative agreement with the United States, vocational education was carried on with great efficiency since 1917; and work on the rehabilitation of persons injured in industry was also begun. The enrollment in the public schools increased from 92,437 in 1914 to 138,730 in 1923-24. In the high schools there were enrolled in the latter year 19,083 pupils. The expenditure for education in 1923 was \$6,722,155. The percentage of illiteracy in the State decreased from 2.7 in 1910 to 1.9 in 1920. In the native white population, it remained at 0.4 per cent; and in the foreign-born white population, at 6.6 per cent. The decrease was among the Negro population, from 6.8 per cent to 5.9.

Finance. See STATE FINANCES.

Political and Other Events. During the decade 1914-24, political control in the State fluctuated between the Republican and Democratic parties. For the greater part of the period the former party was in control. In 1914, J. H. Brady, Democrat, was elected to the Senate, while Moses Alexander, also a Democrat, was elected governor. The Democrats were successful also in 1916, when they elected their State ticket by a plurality of 572 votes. The Republicans, however, elected two representatives to Congress. In the presidential election of this year, President Wilson received 70,021 votes; Hughes, 56,368. A new irrigation proj-

ect was begun during the year to develop the territory known as the Bruneau country, about 400,000 acres in extent, and an electric railroad through this territory was begun. Several anti-alien bills were introduced in the Legislature of 1917, but at the request of the Secretary of State, followed by the protest of the Japanese Ambassador to Secretary Lansing, they were not pressed to passage. These bills would have prevented any Japanese from owning land in the State. On Dec 10, 1917, the United States Supreme Court upheld the State prohibition law. In the election of 1918, Senator Borah was reelected, and John F. Nugent, Democrat, also was elected to the Senate, to complete the unexpired term of J. H. Brady, deceased. As a result of legislation in 1919, the State administration was reorganized. For the 46 boards and commissions that were abolished was substituted a commission or cabinet of nine officials representing the department of agriculture, commerce and industry, finance, immigration, labor and statistics, law enforcement, public investment, public works, public welfare, and reclamation. In the election of 1920, the Republicans again carried the State, electing D. W. Davis governor and Frank R. Gooding United States Senator for the full term. At this election several constitutional amendments were adopted, one of them increasing the membership of the Supreme Court from three to five, and another authorizing a bond issue of \$2,000,000 for the improvement of State highways. In the elections of 1922, C. C. Moore, Republican, was elected governor, defeating both the Democratic and Progressive candidates. The question of the direct primary, the chief issue in this election, occupied the attention of the Legislature in 1923. The State primary law so far as it related to State officers had been repealed by the previous Legislature, which had a Nonpartisan-Democratic majority, and the governor had been elected on a platform which endorsed the repeal. However, sufficient number of Democrats and Progressive Republicans who favored a new direct primary law having been elected to the Legislature, a new primary law was passed; but it was vetoed by the governor. There was also an abortive attempt to pass a measure putting into effect the initiative and referendum authorized by the constitution of 1912.

Legislation. The most important actions taken by the Legislature in the decade 1914-24 are noted below. In 1915 it passed an anti-alien land ownership bill similar in its provisions to the California measures prohibiting the ownership of land in the State by alien persons, firms, or associations. A State-wide prohibition bill, to be effective in 1915, also was passed. A workmen's compensation measure was vetoed by the governor. The Legislature provided in this year for absentee voting and passed a workmen's compensation law. In 1919 it ratified the Federal prohibition amendment. In 1921, measures were passed authorizing the school districts to provide for the education of adult residents who were unable to read and write; creating a bureau of budget and taxation; providing for cooperative marketing; and establishing a teachers' retirement fund. The Legislature of 1923 created a small claims court and provided that where a person has been three times convicted of a felony, whether within or without the State, he is declared a

persistent violator of the law and may be sentenced to prison for not less than five years. A measure was passed extending the absent voter privilege to persons who because of physical disability expect to be confined to their homes on election day. Another measure reserved the mineral rights of State lands to the State, and provided for their lease on a royalty basis.

IDAHO, UNIVERSITY OF. A coeducational State institution at Moscow, Idaho, founded in 1889. In the decade 1914-24, the enrollment increased from 747 to 1647, the resident faculty from 80 to 126, and the size of the library from 32,000 volumes to 80,000. The School of Mines and the School of Forestry were established in 1917 and the School of Education in 1920 bringing the total of separate schools and colleges to seven. Curricula in pre-medical studies, in music, and in business were established in the College of Letters and Science, and departments of agricultural education, psychology, and architecture were created. The south wing of the administration building was completed in 1920; Lindlev Hall, a men's dormitory, was built in 1920-22, and Mary E. Forney Hall, a dormitory for women, was opened in 1923. Accommodations of the College of Engineering were augmented in 1923 by purchase of the plant and equipment of a Moscow industrial concern, including several shop buildings. Eleven minor buildings were acquired or built in the decade. Melvin A. Brannon, Ph.D., was president until 1917, Ernest Hiram Lindlev, Ph.D., from 1917 to 1921; and Alfred H. Upham, Ph.D., from 1921.

IDDINGS, EDWARD JOHN (1879-). An American educator and expert in agriculture, born at Peru, Ind., and educated at Butler College in Indianapolis and Colorado Agricultural College. He was a member of the faculty of the latter until 1910, when he joined the faculty of the University of Idaho. In 1910-11 he was principal of the School of Practical Agriculture and assistant in animal husbandry, and in 1911 he became professor of animal husbandry. Since 1918 he has been dean of agriculture and director of the Agricultural Experiment Station. He is the author of numerous bulletins and articles relating to live stock.

IDO. See INTERNATIONAL LANGUAGE.

ILLEGITIMACY. See CHILD WELFARE.

ILLINOIS. Illinois is the twenty-third State in size (56,665 square miles), and the third in population, capital, Springfield. The population increased from 5,638,591 in 1910 to 6,485,280 in 1920, a gain of 15 per cent. The white population rose from 5,526,962 to 6,229,333; Negro, from 109,049 to 182,274, native white, from 4,324,402 to 5,092,382, foreign-born from 1,202,560 to 1,206,951. The urban population mounted from 3,476,926 in 1910 to 4,403,153 in 1920, while the rural decreased from 2,161,662 to 2,082,127. The growth of the principal cities of the State was as follows: Chicago (q.v.), 2,185,203 to 2,701,705; Peoria, 66,950 to 76,121; East St. Louis, 58,547 to 66,767; Rockford, 45,401 to 65,651.

Agriculture. Illinois is one of the most important of the agricultural States, and conditions during the decade 1910-20, especially in the latter part of that period, were therefore affected by the general agricultural situation in regard to wheat and other products. See AGRICULTURE, CORN, and WHEAT. While the population of the State increased 15 per cent in the

decade 1910-20, the number of farms decreased 5.8 per cent (from 251,872 in 1910 to 237,181 in 1920); the acreage in farms decreased from 32,522,937 to 31,974,775; and the improved land from 28,048,323 to 27,294,533 acres. The total value of farm property, on the other hand, showed an apparent increase from \$3,905,321,075 in 1910 to \$6,666,767,235 in 1920, and the average value per farm from \$15,505 to \$28,108. In interpreting these values, however, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The percentage of land in farms decreased from 90.7 in 1910 to 89.1 in 1920; percentage of improved farm land, from 86.2 to 85.4. Of the total of 237,181 in 1920, 132,574 were operated by owners, 3411 by managers, and 101,196 by tenants, while the comparative figures for 1910 were 145,107, 2386 and 104,379. The white farmers in 1920 numbered 236,288, compared with 250,447 in 1910; foreign-born farmers, 22,111 and 33,394; colored farmers, 893 and 1425. In 1920, 68,892 farms were free from mortgage, compared with 86,713 in 1910; 51,039 were mortgaged, compared with 55,792 in 1910. The number of dairy cows on the farms in 1920 was 1,148,173, as compared with 1,050,223 in 1910; "beef cows," 501,034, as compared with 281,957, mules, 168,274, as compared with 140,631; hogs, 4,639,182, as compared with 4,686,362; and sheep, 637,685, as compared with 658,484. The estimated production of the principal farm crops in 1923 was: corn, 362,678,000 bushels; wheat, 62,506,000; oats, 146,394,000; rye, 3,450,000, barley, 6,656,000; potatoes, 10,696,000; and hay, 3,786,000 tons. Comparative figures for 1913 are: corn, 282,150,000 bushels; wheat, 41,888,000; oats, 104,125,000; rye, 808,000; barley, 1,404,000; potatoes, 5,750,000; and hay, 2,450,000 tons.

Mining. Illinois, although it produces practically no metals, is one of the most important of the mineral producing States. It ranked fifth in the value of its mineral products in 1921. These, in the order of their value, are coal, petroleum, clay products, and cement. The condition of mineral production in the decade 1914-24 is indicated by the comparative figures given below. The production of coal in 1914 was 57,589,197 short tons, valued at \$64,693,529; 1915, 58,829,576 and \$64,622,471; 1916, 66,195,336 and \$82,457,954; 1917, 86,199,387 and \$162,281,822; 1918, 89,291,105 and \$206,860,291; 1919, 60,862,608 and \$140,075,969; 1920, 88,724,893 and \$273,509,000; 1921, 69,602,763 and \$190,986,000; and 1922, 58,467,736 and \$168,925,000. The falling off in 1921 and 1922 was largely the result of the six months' strike in the Middle West coal fields. Production of petroleum decreased with comparative steadiness during the decade. In 1914 there were produced 21,919,749 barrels, valued at \$25,426,179; in 1916, 17,714,235 and \$29,237,168; 1918, 13,365,974 and \$31,230,000; 1920, 10,774,000 and \$39,583,000; 1922, 9,383,000 and \$19,291,000. The value of clay products on the whole increased in the decade: in 1914 they amounted to \$13,318,953; 1918, \$12,459,777; 1920, \$26,138,419, and 1921, \$19,041,182. The production of cement, exclusive of natural cement, was practically constant, ranging from 5,401,805 barrels in 1914 to 3,594,038 in 1918;

5,538,558 barrels in 1920, and 5,587,825 barrels in 1921. The value of the product, however, greatly increased, owing chiefly to the decreased purchasing power of money and the consequent higher prices. The value of shipments in 1914 was \$4,848,522, while in 1921 for practically the same production the value was \$9,092,982. In addition to the products mentioned above, the State produces large quantities of coke, sand and gravel, and stone, and smaller quantities of asphalt, mineral waters, and natural gas. The total value of the mineral products in 1921 was \$254,019,136, compared with \$373,926,540 in 1920; \$213,701,212 in 1919, \$271,244,365 in 1918, and \$117,166,370 in 1914.

Manufactures. Illinois is one of the most important manufacturing States. It has 44 cities with populations of more than 10,000, which form 58.7 per cent of the total population. Of the total value of the manufactured products in 1919, these cities reported 84.3 per cent. In 1909 there were, in the State, 18,028 manufacturing establishments; 1914, 18,388; and 1919, 18,593; while persons engaged in manufacture numbered 561,044, 617,927, and 804,805, in those years. The capital invested amounted to \$1,548,170,701, \$1,943,835,846, and \$3,366,452,969. The value of the products in 1909 was \$1,919,276,594, in 1914, \$2,247,322,819, and 1919, \$5,425,244,694; this increase, however, was due largely to changes in industrial conditions brought about by the War and cannot be properly used to measure the growth of the manufactures during the census period, but the increase shown in the number of wage earners clearly indicates a decided growth in the manufacturing activities of the State. The most important industry in point of value of products is that connected with slaughtering and meat packing, the value of which in 1909 was \$389,595,000; in 1914, \$489,230,000, and 1919, \$1,294,167,000. Foundry and machine shop products rank second, amounting in 1909 to \$138,579,000; 1914, \$141,329,000, and 1919, \$421,969,000. The manufacture of men's clothing, in third place, in 1909 amounted to \$89,473,000; in 1914, \$89,144,000, and in 1919, \$201,816,000. Industries relating to the manufacture of iron and steel products rank fourth, with products valued at \$86,608,000 in 1909; \$64,995,000 in 1914, and \$173,345,000 in 1919. The chief manufacturing cities are Chicago, Peoria, East St. Louis, and Rockford. In Chicago, in 1909, there were 9656 manufacturing establishments, with a product valued at \$1,281,171,000; in 1914, 10,115 with \$1,483,498,000; in 1919, 10,537 with \$3,657,424,000. Rockford, in 1909, had 205 manufacturing establishments, with a product valued at \$22,226,000; in 1914, 265 with \$26,371,000, and in 1919, 312 with \$74,919,000. In Peoria, in 1909, there were 283 establishments, with a product valued at \$63,061,000; in 1914, 283 with \$64,689,000, and in 1919, 253 with \$57,075,000. Similar figures for East St. Louis were: in 1909, 138 establishments, with a product of \$18,104,000; in 1919, 157 with \$77,293,000.

Education. Illinois has always been one of the most aggressive States in the development of educational systems, and its progress continued during the decade 1914-24. During the latter part of this period an active campaign was carried on by the State Teachers' Association to secure an annual distribution of \$20,000,000 from the State and the various counties for

educational purposes. This movement had a great effect in turning the attention of taxpayers and lawmakers to the principles underlying the educational State distributive fund. The Legislatures during the period enacted several important laws, including measures providing for humane education; physical education; the teaching of all elementary subjects in the English language only; and, in 1921, a measure for making the teaching of representative government in the public schools and other educational institutions in the State compulsory. In 1923 a State continuation school law became effective, requiring that continuation classes be organized in districts having as many as 20 boys and girls between the ages of 14 and 18 out of school, unless such individuals have completed a four-year high school course. Vocational education was carried on successfully during the decade and included, under vocational home economics, courses in home-making, nursing and dietetics. The Legislature of 1921 created a State Educational Commission to investigate the entire educational system of the State with a view to the standardizing, unification, and correlation of its various efforts, policies, and agencies, and for other purposes. A teachers' pension law was enacted by the Legislature of 1915. In 1923, 325 school districts had been consolidated, in the elementary schools of which 7332 were enrolled, and in the high schools 1337. Vocational courses, including courses in agriculture, industrial education, and home economics, were being conducted in 199 cities in 1923; and \$435,327 was disbursed from Federal and State funds for their support. The enrollment in the public schools increased from 1,007,894 in 1911 to 1,200,922 in 1921; in the elementary schools from 941,549 to 1,060,304, in the high schools from 66,355 to 140,618, or 111.92 per cent. The total expenditure for educational purposes in 1922-23 amounted to \$103,434,444; in 1914-15, the total was \$41,284,275. The percentage of illiteracy in the State decreased from 4.7 per cent in 1910 to 4.3 per cent in 1920; among the native white population from 2.2 per cent to 1.4; among the Negro population, from 12.4 to 7.9. Among the foreign-born white population it increased from 10.3 to 11.7 per cent.

Finances. See STATE FINANCES.

Political and Other Events. The political history of Illinois is always eventful, and the decade 1914-24 was no exception to the general rule. In the elections in 1914, women for the first time took part. Lawrence Y. Sherman was reelected to the Senate. The Republicans also elected 16 members of the House of Representatives, including Joseph G. Cannon. The Supreme Court in 1915 upheld the woman suffrage act passed in 1913. In 1915, Carter H. Harrison, five times elected mayor of Chicago, was defeated for the Democratic nomination by Robert M. Schweitzer, who in turn was defeated by William Hale Thompson, Republican candidate, by about 147,000 votes. Women for the first time participated in the city elections. Frank O. Lowden in 1916 was nominated by the Republicans for governor, and Edward F. Dunne by the Democrats; Lowden was elected. In the election for president, Charles E. Hughes received 1,152,316 votes; President Wilson, 950,081. In 1916 a serious race riot in East St. Louis occurred on June 8 from trouble between negroes and white men; it lasted for three days.

For this period the city was in the hands of a mob. The killed numbered 29 persons, of whom 25 were negroes; over 300 houses were burned. The riot began when a negro attacked an automobile which contained several policemen. Indictments were found against more than 100 persons, 32 of whom were accused of murder. A grand jury declared in its findings that the police had been grossly negligent and could have prevented the riot. On May 26, 1917, a terrific windstorm caused considerable loss of life and great damage to several towns of the State. In the elections of 1918, Medill McCormick was elected United States Senator, defeating Senator James Hamilton Lewis, Democrat. Elections were held in 1920 for governor and other State officers, and for United States Senator. Len Small, Republican, was elected governor, and William B. McKinley, also a Republican, was elected United States Senator. In the voting for president, Warren G. Harding received 1,420,480 votes; J. M. Cox, 543,395. During the summer of 1920 and at various later periods, a constitutional convention was in session. The new constitution proposed by the convention was rejected by the people in December, 1922. On July 20, 1921, Governor Small and Lieut.-Gov. Fred E. Sterling were indicted for conspiracy to defraud the State and for embezzlement of public money during their respective terms as State Treasurer. These indictments were based on charges that the accused officials had retained for their own use large sums paid them as interest on State funds. Governor Small was arrested on August 8 and was released on \$50,000 bail. After a trial he was acquitted on June 24, 1922. During 1922, the State suffered from coal mining strikes which were accompanied in several cases by riots. In Herrin a mob of striking coal miners killed 50 nonunion miners, after they had surrendered their arms, under the most brutal conditions. The town was placed under martial law, and many persons were arrested. In trials held in 1923, the jury returned a verdict of not guilty. A report of the committee of the Legislature, on June 20, 1923, placed the blame for these riots and killings on public officials who had failed to send militia to prevent the outbreak. (See STRIKES.) In 1923, William E. Dever, Democrat, was elected mayor of Chicago, succeeding William Hale Thompson. Fred Lundin, the political boss of the city during the Thompson administration, was indicted in 1923, together with officials of the Board of Education, for fraud. Lundin was tried and acquitted, as were most of the other defendants. Primaries for the nomination for governor, for United States Senator, and for other officers were held in April, 1924. Senator McCormick, a candidate for reelection, was defeated by Charles S. Deneen. Len Small was renominated for governor by the Republicans. The Democrats nominated Albert Arnold Sprague for United States Senator and Norman L. Jones for governor. Serious trouble arose early in 1924 in Williamson County, the scene of the Herrin murders of 1922, over attempts to destroy illicit stills and to suppress related forms of lawlessness. Conflicts took place between the police, alleged members of the Ku Klux Klan, and citizens. The National Guard took control until the disturbances were quieted.

Legislation. The most important proceedings of the Legislature in the decade 1914-24

are noted below. In 1917 the Legislature adopted a State civil administrative code by which all branches of the government were readjusted, duplicated services were abolished, and departments with responsible heads were established, many beneficial changes being thus effected. The Legislature also enacted a "blue sky" law. The Legislature in 1919 ratified the Federal suffrage amendment; it was the first State Legislature to take this action. It passed a "search and seizure" bill for the enforcement of the prohibition law; entered on a roadbuilding project involving the expenditure of more than \$87,000,000; abolished the State Board of Equalization of 25 members; substituted a State Tax Commission of 3 members to be appointed by the Governor, and provided for changes in the government of Chicago, including the non-partisan election of aldermen. The movement to establish an eight-hour day for women was defeated. In 1921 the Legislature passed measures providing for equality in voting between men and women. An act was also passed providing for compensation to veterans of the War, to be paid out of a bond issue of \$55,000,000, subject to the approval of the people. The act was duly approved by popular vote. The Legislature in 1923 passed a measure forbidding the wearing of masks in public places with the intent to conceal the wearer's identity. It also passed a bill to facilitate cooperative marketing of agricultural products and made provisions for creating associations for this purpose.

ILLINOIS, UNIVERSITY OF. A coeducational State institution at Urbana, Ill., founded in 1867. The enrollment increased approximately 70 per cent during the decade 1914-24, with 5500 at the beginning of that time and 9309 for the first and second semester of 1923-24. Counting additional students in the summer term, the total net enrollment for 1923-24 was more than 11,000. The faculty increased correspondingly, from 704 in 1914 to 818 in 1922-23; the library was increased from 310,000 volumes in 1914 to 577,321 in 1923-24, and the income of the institution from \$2,775,000 to \$6,211,564. The genetics building and the vivarium were erected in 1916, a women's residence hall in 1917, education building in 1918, the Smith Memorial music building in 1919, and the medical research laboratory and library at Chicago. The horticultural and agricultural buildings and the stadium were begun in 1922, and work was to begin in the spring of 1924 on the following buildings, for which money had been granted by the Illinois Legislature: first unit of a new library (\$750,000); new commerce building (\$500,000); new men's gymnasium (\$500,000); women's residence hall (\$250,000); and a miscellaneous agricultural service building (\$380,000). David Kinley, Ph.D., LL.D., succeeded Edmund J. James, Ph.D., LL.D., in 1910, as president.

ILLINOIS COLLEGE. The oldest collegiate institution of Illinois, founded in 1829 at Jacksonville, Ill. The enrollment of the college department increased from 131 in 1914 to 332 in 1924, while that of the conservatory of music was 189 in 1914 as compared with 184 in 1924. The preparatory department was discontinued during the period. The productive endowment increased in the 10 years from \$386,717 to \$871,374, and the total yearly income from \$48,448 to \$120,517. The science building was burned in

1920; the walls remained standing, and the building was reconstructed at a cost of \$50,000. Departments of psychology and education and of economics and business administration were established. Preparations were under way in 1924 for the celebration of the centenary of the college. President, Charles Henry Rammekamp, Ph.D.

ILLINOIS WOMAN'S COLLEGE. An institution for women founded in 1846 at Jacksonville, Ill. The number of students registered in the regular college courses increased from 185 in 1914 to 284 in 1924, and the number in special courses from 97 to 274. The preparatory academy was closed during the period, and the two-year courses in fine arts, public speaking and home economics were discontinued. The library increased from 3000 to 13,800 volumes, and the gross income from \$105,000 to \$190,000. In 1914 there was no productive endowment; in 1924 the endowment amounted to \$400,000, plus \$300,000 in pledges. A gymnasium was built in 1917. President, Joseph R. Harker.

ILLITERACY. See EDUCATION IN THE UNITED STATES.

ILLUMINATION. See ELECTRIC LIGHTING.

IMELMANN, RUDOLF H. R. (1879-). A German writer and specialist on the English language and literature, born in Berlin, and educated at the universities of Jena, Bonn, Berlin, and Freiburg. For many years he made frequent trips to England. He became professor of English literature at Rostock. His principal works are: *Das Altenglische Menologium* (1902); *Layamon* (1906); *Der Deutsche Krieg und die Englische Literatur* (1915); *Forschungen zur Altenglischen Poesie* (1920); a history of English literature; and translations of Byron and Browning.

IMMIGRATION. The widespread agitation for the restriction and control of immigration, which was increasingly successful from 1914 to 1924, seemed to indicate the abandonment, at least temporarily, of the time-honored theory that the United States should be a refuge for those persecuted and in distress; the stand was definitely taken in this period that immigration should be regulated primarily in accordance with the need and best interests of the country itself. The growth in this sentiment for restriction was based not so much, perhaps, on actual increase in the number of alien immigrants (although fear of flooding after the War had much to do with bringing the issue to a head) as on the changed character of the immigration. It was the rapidly increasing proportion from southern and eastern Europe, a class regarded as less easy to assimilate, which gave rise to fears in some quarters that the problem of assimilation, already serious, would grow quickly out of hand unless restrictive measures were taken. Some groups saw in a flood of this divergent type a danger to the fundamental character of the population and a menace to cherished institutions. Labor fought against the overcrowding of the market with workmen whose standards of living and inaccessibility for organization had a tendency to lower wages and living standards. The steady growth of this sentiment against so-called unassimilable elements in immigration, and the success of the attempt to check their influx, made the period important in the development of a definite immigration policy.

See ANTHROPOLOGY; ETHNOGRAPHY; RACE PROBLEMS.

The tendency in immigration was generally to increase numerically. For 1905-14 the average was 1,012,194 alien immigrants entering in one year. With the War there came a sharp decline in numbers, and the annual average for 1915-18 dropped to 257,887; but in 1921 the number of alien immigrants admitted was again over 800,000. The table, giving the net increase of population by arrival and departure of aliens, 1908-23, shows an equally sharp curve.

in 1920-21, 66.7 per cent of the total number of immigrants admitted were of races and peoples peculiar to South and East Europe and Asiatic Turkey. With the turn of the tide in the latter part of 1920, and the prospect of increasing numbers from southern and eastern Europe, the feeling against this type of immigrant grew stronger. Because of racial differences they were not easy to assimilate; they showed a greater tendency than the north-western Europeans to crowd in urban centres and thus oversupply the labor market; they

NET INCREASE OF POPULATION BY ARRIVAL AND DEPARTURE OF ALIENS, FISCAL YEARS
ENDING JUNE 30, 1908 TO 1923

	Immigrant	Admitted Nonimmigrant	Total	Emigrant	Departed Nonemigrant	Total	Increase

Grand total	9,949,740	2,313,383	12,263,123	3,498,185	2,957,611	6,455,796	5,807,327

The number of alien immigrants admitted in the decade ending in 1910 was 8,795,386, or 116 per 1000 of the initial population. For the decade ending in 1920 the number was 5,735,811, or 62 per 1000. While in 1910, out of a total population of 91,972,266, the foreign-born numbered 13,345,545 or 14.5 per cent, in 1920, out of 105,710,620, they numbered 13,712,754, or 13 per cent, practically the same proportion as in 1860 (13.2). (See POPULATION.) The lessening of the proportion of foreign-born during the decade was no doubt due in large part not only to the falling off in immigration during the War but also to the unusually high rate of emigration among aliens. In 1916, 129,765 aliens left the United States; in 1917-21, the average annual emigration amounted to 164,083; in the two years following the War the outward movement to Europe, largely to the south and east, practically offset the immigration from that continent. In the latter part of 1920, however, the tide began to turn, and by 1921 the annual increase in population because of immigration was well on its way back to the peak figure.

It was the marked change in the character of the immigration, however, which seemed the main cause of uneasiness. In 1882, 85 per cent of the European immigrants came from the North and West; by 1907, 85 per cent was coming from the East and South. For a considerable number of years before 1914 the normal annual number of alien immigrants from the North and West had been 185,000, as compared with 750,000 from the East and South. Although immigration from Austria, Hungary, Germany and Russia fell off to practically nothing in the years immediately after 1917, and although about this time there was a striking increase in immigration from Mexico and Canada,

brought with them more often the danger of radicalism.

The growing movement to control immigration, which up to 1910 had developed only so far as to exclude the morally and physically undesirable and the contract laborer, to bar Chinese, and practically to bar Japanese by virtue of the "Gentleman's Agreement," at first contented itself with efforts to set a literacy test. The struggle for this restrictive measure dated back to 1897, when Cleveland vetoed the proposal; it had become prominent again in 1906. Taft vetoed such a bill in 1912, Wilson in 1915. In 1917, Wilson vetoed the proposal for the second time, on the ground that it punished the immigrant for what was no fault of his, and because, in allowing for the exemption of refugees from religious persecution, it might lead to embarrassing expressions of opinion on governmental policies abroad; but the measure was passed over his veto. This bill required that all aliens over 16, who were physically able, in order to be admitted must be able to read English or some other language or dialect, although it allowed for the bringing in of father or grandfather over 55, wife, mother, grandmother, unmarried or widowed daughter, and for the entry of those persecuted for religious reasons, even if illiterate. It also contained a clause restricting Oriental immigration and increased the poll tax on entering aliens to \$8. The effect of this bill is shown in the fact that while between 1908 and 1917, 1,617,000 illiterates over 14 had been admitted, and while in 1913 illiterates made up 26.6 per cent of the entering alien immigrants, in 1920 this class numbered only 15,094, or 4.4 per cent of the total number admitted. There is some significance also in the increased proportion of rejected applicants: 2.3 in 1914; 5.3 in 1915;

4.9 in 1916; 4.2 in 1917; 3.3 in 1918; 3.6 in 1919; this, although due in some measure to the more rigid inspection possible when immigration had fallen low during the War, was also attributable to the new requirement.

In 1920, with a marked increase in immigration toward the end of the year, the fear of a flood from the war-stricken countries of Europe was intensified, and the demand for still further restriction became insistent. In 1921, the American Federation of Labor, fearful for one thing of the unemployment situation, was vigorously advocating complete prohibition of immigration for two years. The American Legion was calling for rigorous exclusion of revolutionaries. On the other hand, the Inter-Racial Council, chiefly representative of large employers, continued to argue the need of unskilled labor, and the danger of giving labor in this country a monopolistic control of the

ed with excess applicants to such a serious extent that steps had to be taken to admit many temporarily. The congestion continued for about six months, to some degree. Nevertheless, from July 1, 1921, to Apr 30, 1922, less than 4000 in excess of quotas had applied, and only about 1250 of these had been returned. There was some question as to whether priority was to be established by arrival or by application, and the method of deciding which of the excess applicants should be rejected came in for criticism. The law succeeded, however, in restricting the number of alien immigrants to 180,000 in the first nine months of 1921-22, as compared with 793,000 in the same period in 1913-14, and it had about doubled the proportion from the North and West of Europe, raising it from 14 to 31 per cent. Its effect is shown in the table, which compares the figures for 1922-23 with those for two years before the law was passed.

IMMIGRANT ALIENS ADMITTED BY PRINCIPAL RACES OR PEOPLES IN FISCAL YEARS SPECIFIED

RACE OR PEOPLE	Number admitted			Per cent of total		
	1922-23	1920-21	1913-14	1922-23	1920-21	1913-14
Northern and western Europe	274,507	206,995	253,855	52.5	25.7	20.8
Southern and eastern Europe and Turkey	162,695	537,144	921,160	31.1	66.7	75.6
Mexicans	62,709	29,603	13,089	12.0	3.7	1.1
All others	23,008	31,486	30,376	4.4	3.9	2.5
Total	522,919	805,228	1,218,480	100.0	100.0	100.0

market; and there was not lacking a large body of sentiment that the United States should still continue to be an asylum for the politically and economically oppressed. Among the remedies proposed was an agency to regulate the flow and the nature of immigration in accordance with the country's need; examination at ports of debarkation was advocated. An emergency measure presented to Congress in 1920 provided for a practical shutting off of immigration for 14 months. The bill finally passed, in 1921, was based on the percentum limit plan; it provided that the number of aliens of any nationality admitted in any fiscal year was not to exceed 3 per cent of the number of foreign-born residents of that nationality in the United States in 1910, nationality to be determined by country of birth. It applied only to Europe, the Near East (including Turkey, Persia, Mesopotamia, and Arabia), Africa, Australia, New Zealand, Asiatic Russia, and islands of the Atlantic and Pacific not adjacent to the mainland of the western hemisphere. This percentum limit arrangement was designed seemingly to decrease the number of immigrants from southern and eastern Europe and to increase proportionately the number from the North and West; whereas in the years before 1914, the normal annual number of immigrants from the North and West had been about 185,000 and from the South and East about 750,000, under the new quota arrangement these figures were limited to 200,000 and 155,000 respectively. Since the law was passed only on May 19 and became effective June 3, a good deal of confusion and difficulty followed. According to its provisions, not more than 20 per cent of the total of any quota was admissible in any one month; in June, 1921, 11,000 in excess of quotas applied for admission. Entering ports, particularly Ellis Island (which at this time and later came in for violent criticism on the score of inhumane accommodation for detained aliens), were crowd-

In May, 1922, the life of this percentum act was extended to June 30, 1924; at the same time the requirement of one year's residence in an adjacent country, to escape the quota restriction, was raised to five years.

Restriction still continued an important issue. In 1922 there was an agitation for relaxation. In that year 100,058 unskilled laborers had left the country and only 32,728 had been admitted; it was urged that there was about to be a dearth of men for work that did not attract workers already in the country. But the advocates of more severe restriction were successful. A measure to replace the existing bill, which expired June 30, 1924, was drawn up in that year, and after much heated discussion over the method of fixing the quota, and over the Japanese exclusion clause, it was passed in both houses by a large majority. After Congress, by more than a two-thirds majority, had refused his request to postpone until March, 1925, the date on which the Japanese exclusion clause became effective, President Coolidge signed the bill on May 26. By this measure the aggregate immigration from outside the western hemisphere was limited to 161,000 persons annually for three years, and to 150,000 thereafter. After July 1, 1927, the aggregate quota was to be divided exactly in accordance with the national origin of the whole population, according to the latest census. Under the new arrangement, 75 per cent of the immigrants would be drawn from northern and western Europe. Wives, minor children, and elderly parents were privileged to enter as a nonquota class. Apart from the contention that it was not in accordance with American ideals to base immigration on a selfishly economic basis, the bill was criticized as an undesirable "expression of responsible thought in America on controversial theories as to relative worth of nationalities." As proclaimed by President Coolidge, June 30, 1924, the largest quota for 1924-25 was that of

Germany, 51,227. The quota for Great Britain and Northern Ireland was 34,007, Irish Free State, 28,567; Italy, 3845; Russia, 2248.

Asiatic Immigration. Under the Chinese exclusion bill, and the "Gentleman's Agreement" (1907) by which Japan bound herself to give no passports to laborers coming to the United States and to limit the number to Canada and Mexico, the influx of Asiatics had already been greatly restricted. The 71,531 Chinese residents in the United States at the census of 1910 had decreased to 61,686 in 1920. On the other hand, the number of Japanese had increased 53.86 per cent in the 10 years, from 72,157 to 111,025, an increase of about 30,000 in California and about 4000 in Washington. A growing protest against Oriental immigrants began to make itself heard. In 1914 two amendments to the general immigration bill were proposed and rejected, one to exclude all Asiatics except those with rights under existing agreements, and the other anti-Japanese. The immigration bill of 1917 contained a clause excluding Oriental laborers and directed chiefly at Hindus and Malays. Meanwhile on the Pacific coast, feeling against the Japanese had been growing more intense. Not only was the Japanese, like other Orientals, considered unassimilable; the American farmer was not able to compete with his gift for intensive cultivation, his unflagging energy, and lower working and living standards; his growing numbers, and increasing success at the expense of other farmers, changed uneasiness into alarm. The desire for protection was reflected in State laws in California, Washington, Arizona, and Oregon. Not only the right to own land was taken from the Japanese; the right to lease it for three years, which had previously been allowed, was denied in 1920; in 1923 even croppage contracts were forbidden. Resolutions were passed in the latter year in California asking Congress to prohibit Japanese immigration altogether and petitioning for an amendment to the Constitution to exclude from citizenship those children born in the United States of parents ineligible to citizenship. Following all this there was incorporated in the new immigration bill in 1924 a clause excluding would-be immigrants who were not eligible for citizenship, in abrogation of the "Gentleman's Agreement." During the lively debate that followed, the Japanese Ambassador Hanihara, in a letter to the State Department, asked that Japan be given the opportunity to arrange the matter by treaty and called attention to the possibility of "grave consequences" if the Japanese were subjected to the indignity of such discrimination. His letter aroused much criticism, and was styled an attempt to intimidate and to dictate legislation on a domestic matter. Contrary to the advice of Secretary Hughes that Japan be placed on the quota basis, the bill was quickly passed by the Senate by a vote of 76 to 2. The House had previously passed the bill by a vote of 376 to 71. All Japanese, except ministers, members of the learned professions and arts, and students, with their wives and children, were barred. President Coolidge favored the general principle of exclusion but recommended a delay till March, 1925, to arrange the matter by treaty with Japan, if possible. Congress, however, refused by a large majority to accept this recommendation, and the President, moved by other considerations, gave the bill his signature as it

originally stood. Among the arguments advanced in favor of the bill was the impossibility of a situation in which two races with such divergent standards of living were side by side; the right to retain the country for the Caucasian race against a flood of unassimilables; the feeling in some quarters that Japan had not lived up to the "Gentleman's Agreement"; that since no other Oriental country was included in the quota arrangement, Japan had no right to feel herself the object of discrimination. On the other hand the bill was severely criticized as abrupt and a breach of international good manners. It was contended that Japan had kept her agreement to the best of her ability and that if Japanese laborers had continued to be smuggled in under that arrangement, the smuggling could only increase without Japan's cooperation. Moreover, Japan was willing to cooperate in excluding any or all of her citizens and desired only that it be by a law putting her on a par with other nations or by a treaty. Perhaps the most convincing argument against the clause was the claim that it was unnecessary. Secretary Hughes had advocated that the Japanese be included in the 2 per cent quota provision, calling attention to the fact that the entailed admission of 250 immigrants a year was virtual exclusion. The President, in favor of settlement of exclusion by treaty, styled the measure "unnecessary and deplorable." There was much comment on the fact that in so vital a matter, affecting sensibly the general attitude of Japan toward the United States, the definitely expressed opinion of the President and Department of State could be overridden by a Congress without party control.

INCE, THOMAS HARPER (1880-1924). An American moving-picture director, born at Newport, R. I., and educated in the public schools. He was for several years an actor under Charles Frohman. In 1909 he was appointed general director of the New York Motion Picture Corporation and was later president of the Thomas H. Ince Studios and other companies. He directed many successful pictures.

INCOME TAX. See TAXATION IN THE UNITED STATES.

INDIA. The peninsula of Hindustan and the regions to the North, including all those territories governed directly and indirectly by the British. Total area, 1,802,332 square miles; total population in 1911, 315,156,396; in 1921, 318,942,480; gain in population for the decade, 1.2 per cent. Of the British provinces, losses for the decade 1911-21 were shown by Bihar and Orissa, Bombay, Berar, and the United Provinces of Agra and Oudah. Among the native states and agencies the following declined: Central India Agency, Hyderabad, Rajputana Agency, and the United Provinces States. The heavy ravages of famine, the plague, and other diseases accounted for the population's remaining almost stationary. In 1919, for example, births were 30.24 per 1000 to 35.87 deaths; for 1920, births were 33 per 1000 and deaths were 30.8. The 1918 losses of population as a result of harvest failures and the influenza epidemic were among the severest recorded.

The death rate in that year mounted past 62 per cent per 1000. Populations of the largest cities in 1921 were (1911 figure in parentheses): Calcutta, with suburbs, 1,327,547 (1,222,313); Bombay, 1,175,914 (979,445); Madras, 526,911 (511,660). Hyderabad, 404,187 (500,623); Rangoon, 341,962 (293,316); Delhi, the winter capital, 304,420 (232,837). By religions, the population in 1921 was divided as follows (1911 figure in parentheses): Hindus, 216,734,586 (217,586,900); Sikhs, 3,238,803 (3,014,466); Buddhists, 11,571,268 (10,721,449); Mohammedans, 68,735,233 (66,623,412); Christians, 4,754,079 (3,876,196); Animists, 9,774,661 (10,295,168).

Education. The 1921 census indicated that in spite of recent educational progress, the total illiteracy remained enormous. In Bengal, the most advanced of the provinces, 43,000,000 out of the total 47,000,000 were classed as wholly illiterate. Only some 500,000 of the women of Bengal might be classed as literate. The increase in education may be seen from the fact that in 1919-20, in a total of 202,981 institutions there were in attendance in British India 7,612,839 (1,306,711 of these female) as compared with 6,128,725 (875,660 female) in 1912. The cost of maintenance of educational institutions in 1913-14 was £6,696,585; 1919-20, £14,889,696. The well attended colleges and secondary schools seemed strangely out of place in a system where primary education was so largely neglected. This feature was one of the leading preoccupations of the administration during the decade 1914-24, with the result that more attention was being applied toward reaching the masses. University supervision over the colleges was exercised by the six universities of Calcutta, Madras, Bombay, the Punjab, Allahabad, and Patna (established in 1917); the three residential universities of Dacca, Lucknow, and Rangoon; the two denominational universities at Benares (Hindu, established 1917) and Aligarh (Moslem); and the two universities in Indian states at Mysore (established 1916) and Hyderabad.

Agriculture. Agriculture, which occupied the great mass of the population (225,000,000 out of 313,000,000 in 1911) accounted for the cultivation of 224,931,000 acres in 1922-23, out of the 426,988,000 acres of agricultural land, as compared with 219,192,000 acres out of the 387,599,000 of 1913-14. Distribution in 1922-23 was fallow land, 47,411,000 acres; net area sown, 224,931,000; culturable waste, 154,656,000; not available for cultivation, 152,650,000; under forest, 85,595,000; irrigated area, 48,054,000. The table in the next column indicated the progress of agriculture over the period (figures in thousands).

Figures for live stock in 1921-22, with 1913-14 figures in parentheses, were: cattle, 117,665,000 (125,141,000); buffalo, 27,334,899 (18,232,000); sheep, 22,082,000 (23,092,000); goats, 24,333,000 (30,673,000); horses, mules, and donkeys, 3,128,000 (3,230,000); camels, 410,000 (496,000). The favorable harvests which continued up to 1918, and the increasing demands made on agriculture by the Empire during the War, accounted for an unprecedented prosperity. The government instituted a control on prices to protect the laboring classes and in general directed the export flow of wheat and rice. In 1918 the failure of the monsoon hit agriculture severely and caused the necessity

for heavy importations of cereals from Australia. The spread of cooperative societies among agriculturists was noteworthy. In 1923 there

Crop	1913-14		1921-22	
	Acres	Tons	Acres	Tons
Total area of food crops	202,406		191,000	
Rice	79,908	31,547	81,256	37,003
Wheat	28,496	9,370	28,234	9,817
Millet	36,213	6,753	41,128	7,584
Grain	8,958	2,170	14,670	4,855
Sugar-cane	2,537		2,382	
Raw sugar		2,298		2,590
Total area of non-food crops	46,100		40,700

^a Crop given in pounds, all others in net tons

were 56,136 cooperatives with a membership of 2,102,446, engaged for the most part in credit activities. The movement was regarded as an excellent instrument for placing the agricultural classes on a securer foundation. The problem of irrigation continued to loom large. In 1922-23, 48,054,000 acres were being irrigated as compared with 40,679,000 in 1911-12. It was estimated that irrigation canals in existence were valued at £78,600,000 in 1920-21, the net revenue from them was £5,422,000. The Punjab, which has been the seat of greatest activity, saw completed in 1915 a system of canals serving 1,750,000 acres. After the War schemes were projected for the construction of several systems, notably in the Punjab and in Sind, which would serve 10,000,000 acres. In the Madras, Mysore, and Gwalior state governments, important projects were under construction in 1923 for the damming of the Cauvery and Chambal Rivers for hydro-electric as well as irrigation purposes.

Mining. The following comparative figures reveal the state of the mining industry over the period under discussion. Coal production: 1914, 17,565,000 tons, 1922, 19,010,986 tons; 1923, 18,672,798 tons. Gold production: 1914, 4007 fine ounces; 1921, 2855 fine ounces; 1922, 2900 fine ounces. Silver production: 1914, 236,446 fine ounces; 1921, 3,587,587 fine ounces; 1922, 4,244,304 fine ounces. Iron ore production: 1914, 441,674 tons; 1921, 942,084 tons; 1923, 625,274 tons. Manganese production: 1914, 622,898 tons, 1921, 679,286 tons; 1922, 474,401 tons. Petroleum production: 1914, 259,342,710 imperial gallons; 1922, 298,504,000 imperial gallons. Mica production 1914, 4,537,000 pounds; 1921, 3,639,000; 1922, 3,536,000. Progress was thus inconsiderable. The average number of workers in the mines was 250,000, of which, in 1921, 65,786 men, 42,000 women, and 1171 children were engaged in the collieries. Legislation affecting mine workers prohibited the employ of children in the mines; fixed the maximum hours of labor at 54 hours a week; and gave the government power to regulate the conditions of women employed underground.

Manufacturing. The weaving of cotton cloths continued the most important single industry and showed increases, too; the production of cotton cloth mounted from 1,164,292,000 yards in 1913-14 to 1,752,000,000 yards in 1922-23. Similarly, the manufacture of gunny bags and jute cloth rose from 487,848,000 bags and

447,309,000 yards of jute cloth (1914) to 500,000,000 bags and 1,450,000,000 yards of jute cloth (1923). The impetus that the War gave to industry in India by cutting off the foreign sources of supply, and the encouragement accorded to industrialization by the existence of such large stocks of raw materials, were immediately perceptible. From 1917 to 1922 rice mills increased 12 per cent, engineering works 30 per cent, woolen mills 50 per cent, sugar factories 37 per cent, and flour mills 25 per cent. In all, the 4939 establishments of 1917 increased to 6140 in 1922, 1,252,606 workers of 1917 increased to 1,367,136 in 1922. The increased capitalization of joint stock companies over the period 1913-22 again reflected the trend toward industrialization. The total paid-up capital of such companies increased from 750,000,000 rupees in 1913 to 2,500,000,000 in 1922. Again, imports of industrial machinery displayed the same tendency; in 1913-14, such imports were valued at £6,076,606; in 1920-21, £21,004,032. The years 1922 and 1923 saw an alleviation of the political and economic disturbances characteristic of India's late history. In 1923 there were only 132 industrial disputes involving 350,000 workers and incurring a loss of 2,736,000 days as compared with 400 disputes, 523,155 workers, and 6,637,862 days in 1921. It was becoming evident that with encouragement of trade unionism, readjustment of wages, decreased cost of living, better housing conditions, and increasing interest in technical education, the status of labor was taking on an optimistic cast.

Commerce. It did not take long for India to become readjusted to war conditions. The insistent demand for foodstuffs, cotton materials, bagging, and hides from the Allies immediately put Indian raw materials at a premium. But for the depression of 1921, India's commercial activity showed an unbroken advance. Total exports, foreign and domestic, were valued at \$610,836,000 in 1913-14; \$991,378,000 in 1922-23. Total imports for 1913-14 were \$826,875,000; \$956,778,000 in 1922-23. That the increases were real may be adduced from the following export figures, in volume: raw cotton in 1913-14, 531,000 tons; in 1922-23, 673,000 tons; cotton piece goods in 1913-14, 89,234,000 yards; in 1922-23, 156,951,000 yards; tea in 1913-14, 289,474,000 pounds; in 1922-23, 287,448,000 pounds. Similarly, the trade in foodstuffs showed a favorable balance of 38,171,000 rupees for 1921-22 as compared with an adverse balance of 234,320,000 in 1913-14. The following figures reveal proportions by countries of origin (imports) and countries of destination (exports) of India's foreign trade for 1913-14, 1918-19, and 1921-22. Imports: United Kingdom, 64, 46, 57 per cent; Japan, 2, 20, 5 per cent; the United States, 3, 10, 9 per cent. Exports (pre-war and 1921-22): United Kingdom, 25 and 18 per cent; Japan, 7 and 16 per cent; the United States, 7 and 10 per cent. Principal imports and countries of origin for 1921-22 were, for electrical appliances, Great Britain and the United States; hardware, Great Britain, Germany, the United States; iron and steel, Belgium and Germany; sheets and plates, Great Britain, Belgium, Germany; machinery, Great Britain, Germany, the United States; kerosene oil, the United States, Borneo; fuel oil, Persia; textiles, Great Britain and Japan. Similarly for exports: raw cotton, Japan, China,

Germany; dyes and tanning substances, Great Britain and the United States; rice, Ceylon, Straits Settlements, Germany; wheat, Great Britain, Egypt; hides and skins, Germany, Great Britain, the United States; oilseeds, Great Britain, Belgium, France; spices, Aden, Ceylon, the United States; tea, Great Britain, Canada, Australia, the United States; cotton piece goods, Turkey, Persia, Ceylon; raw jute, Great Britain, Germany, the United States; jute bags, Great Britain, Japan, Australia, the United States. Another indication of India's sound commercial status was the record of shipping. In 1913-14, 3168 ships of 6,785,000 tons entered; in 1921-22, 3527 ships of 6,966,000 tons. In 1913-14, 4012 ships of 8,252,000 tons cleared; in 1921-22, 3529 ships of 6,553,000 tons. In 1922-23, 2,986 ships entered of 6,518,150 tons and 3502 cleared of 7,443,517 tons.

Communications. Comparative figures are instructive. In 1913-14 there were 34,652 miles of railway open; in 1921-22, 37,265 miles, in 1922-23, 37,618 miles. Of the last, 7698 miles were state lines worked by the state; 19,107 miles state lines worked by companies; 2951 Indian state lines worked by Indian states; 2306 miles were company lines subsidized by the central or local governments. The passengers carried in 1913-14 were 457,718,000; in 1922-23, 572,695,400. Freight tonnage in 1913-14, 82,613,000 tons; in 1922-23, 93,704,000 tons. In 1922-23 there were 9740 locomotives, 24,695 passenger cars, and 209,134 freight cars. Total capital expended on railways to the end of 1921-22 was 6,560,624,000 rupees as compared with 4,768,250,000 rupees at the end of 1912. Up to the end of the War the Indian railways were able to show a profit, but with depreciation of stocks as a result of the great strain of carrying war materials, higher wages, etc., the inevitable decline manifested itself. The result was that in 1922 the British Parliament sanctioned the request for the flotation of loans amounting to £50,000,000 for the rehabilitation of Indian railroads. Another £50,000,000 was allowed in 1923 for allocation as necessary. By 1921-22 working expenses absorbed 76.2 per cent of the gross earnings so that the net loss to the state, after meeting interest charges, was £9,273,000. By comparison, in 1918-19 the net profit was £11,000,000. In 1920 a committee headed by Sir William Acworth took under consideration the whole problem of railway management. The question which agitated Indians primarily was that of foreign, i.e. English, corporation control of the majority of the lines operated. In the opinion of five members of the committee, direct state management was the most feasible scheme; five others advocated a combination of direct state management and company operation, with central administration, however, located in India. In conformity with the recommendations of the Acworth commission, a high commissioner for railways, as head technical officer, was appointed in November, 1922. An indication of the prevailing trend was the decision on the part of the Legislative Assembly in 1923 to put under state management two of the largest Indian railway systems, operated by English companies, on the expiration of their contracts. These were the East Indian Railway (contract ending 1924) and the Great Indian Peninsular Railway (1925). The perplexing problem of fuel supplies turned India toward a serious consideration of elec-

trification. The first important project aimed at the damming of the Sutlej River for the electrification of the Kalka-Simla line (80 miles). Important schemes carried through in the period 1914-24 were the Muttra-Kotah line, connecting northern India with Bombay, and the bridge across the Ganges at Sara.

Finance. Beginning with 1921, a policy of devolution was applied to the Indian budget whereby the provincial revenues and expenditures were separated from the central government accounts. Incidentally the budget of 1921-22 was the first submitted to the Legislative Assembly. Strenuous measures to check the advancing expenditures, the chief concern of Indian financing for the five years 1919-24, were of no avail, for deficits steadily mounted. The annual deficits of the period totaled 1,000,000,000 rupees, so that the estimated national debt amounted to 7,810,000,000 rupees on Mar. 31, 1923, as against 4,110,000,000 rupees in 1914. It should be noted, however, that 310,000,000 rupees of the annual deficit were covered by the inflation of the currency. Total revenues for 1913-14 for imperial and provincial governments, with the rupee rated at 15 to £1, were £85,207,000; expenditures, £82,895,000. Revenues for 1922-23 for the imperial government alone, with the rupee rated at 10 to £1, were £133,228,000; expenditures, £142,391,000. By the devolution rules, the following heads of revenue were allocated to the central government: opium, salt, customs, income tax, tributes, post office and telegraph, railways, mint, military services; the following to the provincial governments: land revenue, stamps, excise, forest, registration, irrigation, and civil departments. Provincial governments were required to pay annual contributions to the central government. The revenue items to show the largest increases over the period, in the figures for 1913-14 and 1922-23, were: customs, £7,558,000 to £45,418,000; income tax, £1,950,000 to £22,114,000; land, £21,392,000 to £35,030,000 (for 1921-22). The greatest single expenditure was that on the military establishment, which mounted from £19,789,239 for 1913-14 to £60,317,100 for 1921-22, or almost half of the total expenditure. The debt service rose from £2,037,735 (1911-12) to £15,200,900 (1922-23). In 1916 the salt duty was increased, and in 1917 a supertax on incomes was imposed. In 1917 and 1918 Indian war loans were raised for a total of £100,000,000 to aid the home government in the conduct of the War. Of this, £77,274,000 was paid to the British government. Additional amounts to a total of £20,705,000 were paid out toward the same end by 1920-21. The rise in the value of the rupee, due to heavy war expenditures and favorable trade surpluses, and the disappearance of silver from the money markets of the world, sent it from the fixed rate of 1s 4d. before the War to 2s. 4d. by the end of 1919. With silver selling at almost 90d. per ounce in 1920 as compared with 26d. per ounce before the War, it was inevitable that silver should disappear from circulation. The government was compelled to resort to the issuance of paper, so that within the war period almost £80,000,000 in notes was put into circulation. Inconvertibility seemed imminent and might have become an actuality had it not been for the sale of 200,000,000 ounces of silver to the Indian government by the United States, beginning with

1918. However, the factors above cited, together with the fall of the pound sterling and the melting down of rupees into bullion, necessitated drastic action in fixing the relationship between the rupee and the gold sovereign, instead of the pound sterling. Finally in 1920 a committee recommended that the rupee be converted into the gold sovereign on the basis of 10 rupees to the pound instead of the former 15 rupees. The Indian government tried to maintain the new rate by selling drafts on the London exchange, but the depression of 1920-21, the turning of the favorable trade balance into an unfavorable one in 1921, and the fall of the value of silver to 32d. per ounce in 1921, compelled the authorities to relinquish their attempt to bolster up the exchange. By 1924 nothing had been done to force the universal acceptance of the new rate, although in government transactions the rupee was converted at the one-tenth pound sterling rate. Notes in circulation, 1913-14, 861,175,935 rupees; in 1920-21, 1,661,569,750; Dec 31, 1923, 1,966,000,000. By an amendment to the Indian Paper Currency Act in 1920 the government was permitted to emit paper notes without limit on provision that 50 per cent was to be secured by gold or silver, most of it held in India and not England. The financial system was further strengthened by the amalgamation, in 1920, of the three Presidency Banks into the Imperial Bank of India. The general prosperity during the period under discussion accounted for a higher level of wages, though prices rose proportionately. Using prices of July, 1914, as the basis, i.e. at the index 100, the general average wholesale price index for 1920 was 204; 1921, 180; 1922, 180; 1923, 176.

Immigration. In 1916 it was announced by the Indian government that the policy of providing for the eventual abolition of indentured labor in Jamaica, Trinidad, British Guiana, Dutch Guiana, and Fiji, had been accepted by the Secretary of State for India. The system, which had been inaugurated in 1842 and had been pressed by licensed agents, had led to annual migrations of 10,000 coolies, on an average, for work under contract. The permanent settlement of these coolies in Africa, in particular, had led to vexing internal problems (See KENYA; SOUTH AFRICA, UNION OF.). The result had been the prohibition of such emigrations to Natal and Mauritius (1910) and then (1917) to the areas cited above. The decision to put an end to this system was received with approval by the Indians, who had always regarded contract labor as a form of slavery.

Government. In 1919, in order to hasten a more effective native participation in Indian affairs, the Government of India Act was passed, effective for 1919-29. It was based on the report formulated by the Secretary of State for India, Mr. Montagu, and by Lord Chelmsford, the Viceroy. The keynote of the report was the recommendation of a progressive movement toward responsible government founded on a native ministry. With this as its purpose the Act incorporated the idea of a dual form of government for the major provinces, i.e. the Presidencies of Madras, Bombay, and Bengal; the United Provinces, the Punjab, Behar, Crissa; and the Central Provinces, Assam, and Burma. This system, called "dyarchy," consists of the division of provincial matters into two groups, viz., "reserved subjects" over which

the governor-in-council of the province retains control, and "transferred subjects" over which the provincial ministry is the final arbiter. The "transferred subjects" include local self-government, medical administration, public health and sanitation, education, public works, agriculture, fisheries, coöperative societies, excise, registration, adulteration, weights and measures, and religious and charitable endowments. The governor-in-council was in charge of the "reserved subjects"; the governor and a responsible ministry were in charge of the "transferred subjects." The purse for both branches was held in common, and definite sources of revenues were assigned the provinces (see above, *Finance*). Responsible government was assured by making the provincial ministers, appointed by the governor of each province, answerable to the provincial legislative council, at least 70 per cent of whose members were to be elected. Representation by special interests was provided for; the franchise was extended, and in Madras (by statute) and in Burma women were given the ballot. For example, of Bengal's 139 members, 113 were elected, 20 were nominated officials, and 6 were nominated non-officials representing special interests. The governor's powers remained large; he was permitted to withdraw from consideration or to pass over the heads of the council any legislation which he considered jeopardizing the tranquillity or safety of his province. Incidentally he was the focal point to which the affairs of the executive council, the legislative council, and the larger concerns of the central government radiated.

Responsible government was not the rule of the central government. In place of the unicameral house there was a two-chamber legislature, made up of the Council of State and the Legislative Assembly. The Council of State consists of 60 members, only 29 of whom were to be nominated members. The Legislative Assembly was to be made up of 144 members, of whom only 26 of the 41 nominated members could be officials; the other 103 were elective. The Governor-General, or Viceroy, was not a member of the legislature, but for the direction of affairs he was to have to aid him an Executive Council consisting, in 1923, of 8 members. The Governor-General had the power of enacting legislation, subject to the approval of Parliament, and of vetoing legislation that affected the tranquillity or safety of the country. Within clearly defined limitations the annual budget was to be submitted to the Legislative Assembly and Council of State for their approval, though the Governor-General may certify any item in the budget, or even the whole of it. The Act of 1919 also provided for the appointment of a high commissioner for India resident in London.

History. The outbreak of the War found India tranquil. The pledges of loyalty and the offers of money and munitions which poured in reassured the home government that any effort in the war prosecution would not meet with an organized opposition. The result was that India was stripped of its internal defenses to a remarkable degree so that men and war materials might be dispatched to the theatres of war. By 1916 upward of 300,000 men, both British and natives, had left the country. Indian contingents saw service in France, Egypt, East Africa, Gallipoli, and Mesopotamia. The

campaign in Mesopotamia was under the exclusive control of the Indian government. Even the entry of Turkey into the War failed to stir up any considerable discontent. Recruiting was pushed vigorously; a war munitions board controlled the output of materials; and a loan of £100,000,000 was floated for the aid of the Empire. The active measures taken by the government in the regulation of prices and exports and the increased prosperity which came to the population from the sale of raw materials served further to assure tranquillity.

Lord Hardinge was followed by Lord Chelmsford as Viceroy in 1916. The latter's administration was confronted by an awakened nationalistic sentiment taking on greater proportions as the War progressed, and echoed in a growing repressive policy on the part of the Indian government. Under the lead of the National Congress and the Moslem League, the demand for Indian Home Rule became widespread. In 1916 the proposal formulated at the meeting of the two organizations at Lucknow became the official statement of policy of the dissidents and received wide currency as the agitation continued. Unfortunate official tactics added fuel to the flames. Mrs. Annie Besant was in 1917 compelled by the Madras government to quit the city and confine her activities to certain delimited areas. It became increasingly necessary for the home government to make a clear-cut pronouncement of its policy as Lord Chelmsford's position became more difficult. In 1917, Edwin Samuel Montagu, who had just come to the Indian Office after the resignation of Austen Chamberlain, realizing the changed state of affairs in India as well as the new attitude toward the country in the whole Empire, made a declaration promising radical reforms. The chief point of his statement was that an increasing measure of self-government for India was inevitable. In the winter of 1917 and into 1918, Montagu, together with Lord Chelmsford, held extended hearings in India, resulting in the Montagu-Chelmsford Report. The findings set forth the proposal that self-government be tried just in the major provinces under a limited scheme, and that, for the whole of India, complete home rule was as yet inadvisable because of the dissimilar elements in the population and the general unpreparedness. Some moderate elements in the Indian population expressed their approval, but their attitude was overshadowed by the pronounced disappointment and indignation of the thoroughly conscious Indian nationalists, who regarded the proposed reforms as utterly inadequate. On Sept. 1, 1918, the Indian National Congress at Bombay unanimously rejected the reforms. Counter-proposals demanded the extension of the dual government idea to the central government of India and the abolition of the Council of State. Other resolutions passed called for a guarantee of full responsible government within 15 years, equal rights for women, and a large proportion of native Indians in the civil service. Meanwhile the suggestions embodied in the report had been incorporated in the Government of India Bill, which passed the British Parliament in December, 1919. (See above, *Government*.)

India's war effort may be summarized here. In men, India had contributed upward of 1,250,000 recruits, of whom some 30,000 had died overseas as a result of wounds and disease. A

loan of £100,000,000 had been guaranteed. India had been the sole source of supply for the operations in India, Mesopotamia, and Egypt in respect to great variety of commodities, including butter, oatmeal, tinned beef, mutton, biscuits, boots, wearing apparel, as well as 1500 miles of railway, 4500 vehicles, and 250 engines. Strong measures in 1918 had prevented an invasion of India from the North after the collapse of Russia, and the friendly relations with Afghanistan had kept that country well disposed during the War. In all, considering the usual poverty of the great proportion of India's population, the effort had been extraordinary. No doubt the following unrest was engendered by the after-effects of the War.

The years 1919-24 saw increasing disorder. The passage of the untimely Rowlatt Acts in March, 1919, brought matters to a head. These measures, which included the Indian Criminal Law Act and the Emergency Criminal Law Act, were aimed at a more rigorous enforcement of the penal statutes against sedition and gave the Governor-General extraordinary powers in the matter of search and punishment of those suspected of propagating revolutionary doctrines. Many members of the Legislative Council refused their consent to the passage of the acts; several members of the government resigned in protest; Indian leaders universally condemned the measures. The Indian National Congress, meeting at Allahabad, pronounced against the laws and approved several other resolutions of a radical tenor. Among these was a demand for self-determination and the appointment of a commission comprising Tilak, Gandhi, and Hassan Imam, to put the Indian case before the Peace Conference. As the only way open, short of violence, to contest the growing British power, a Passive Resistance League was formed at Bombay as a result of the activities of M. K. Gandhi. The movement quickly spread through northern India, and in March and April, 1919, disturbances were frequent throughout the Punjab and the Bombay Presidency. A riot and street fighting occurred in Delhi; at Amritsar, government buildings were burned, telegraph wires were cut, and fighting was general. Lahore became prominent in the troubles, and the government was compelled to extend martial law over the whole district from April to June. Meanwhile, the arrest of Gandhi had inflamed the rioting. The intemperance with which the disorders had been put down, in Amritsar in particular, made no friends for the British cause. On Apr. 13, 1919, an outbreak which reached tragic proportions occurred at Amritsar. As a result of the zeal of General Dyer, British soldiers fired on a meeting of unarmed Indians, with the result that 400 were killed and at least 1000 wounded.

Affairs were rendered more serious for the British by the outbreak of the Afghan War in 1919. The accession of the Amir, Amanulla, in February, 1919, as a result of the assassination of his father, and the unfriendly feeling which had been generated among Mohammedans as a result of British successes in the War, together with excesses in India, made the northern regions a real danger zone for India. The Amir moved his troops into the Khyber, attempting to catch the Indian army unawares, but a hasty mobilization of troops and the capture of Dacca, together with the bombing of Kabul and Jalalabad, immediately brought the

Amir to terms. The treaty, as signed in August, terminated the payment of the subsidy to Afghanistan but freed her from outside control in foreign relations. Another campaign in the country adjacent, the Waziristan, as a result of the outbreak of the Mahsuds and Wazirs, was undertaken at the same time. Before the tribesmen could be completely pacified the British lost heavily in two encounters, one in December, 1919, and the other in January, 1920. Not until May, 1920, did hostilities terminate. An official investigation revealed the inefficiency of the Indian army and the fact that these two operations had cost the government £15,000,000.

Indian nationalistic activity continued. The unhappy results of the passive resistance policy merely strengthened the opposition. The "non-coöperation" movement inaugurated by Gandhi late in 1919 received the approval of the Indian National Congress in 1920. Boycotts against the courts by lawyers, of the legislative councils by public men, of foreign imports by consumers, and of educational institutions by students, became the rule. The hostility was reflected in England, where Montagu was severely attacked in the House of Commons; General Dyer, who had been responsible for the killings at Amritsar, was penalized by retirement and a vote of censure. The anti-Mohammedan character of the Treaty of Sèvres was responsible for serious disorders in southern India, for in Malabar rioting was frequent throughout 1921. The influence of Gandhi showed no signs of weakening. As a result of his propaganda the committee sitting for the Congress of All India in November, 1921, adopted a resolution advocating the principle of "civic disobedience," i.e. a refusal to pay taxes and to coöperate with the government. The boycott of English imports, cotton goods, and clothing in particular, spread over the country. The meeting of the Indian National Congress at the end of 1921 put its stamp of approval on Gandhi's procedure and put down an attempt to force through a policy favoring violence. The Prince of Wales's visit in November, 1921, while it was received with good will in official quarters, indicated the temper of the people. Rioting, in which some 20,000 natives participated, broke out in Bombay; similar demonstrations took place all along the route. The tidal wave of unrest and censure reached even the distant English shores. Throughout 1921 and 1922 liberal opinion was unsparing in its criticism of the government's position. Authority was given to the opposition by the attack on the government of India by Sir Michael O'Dwyer, former lieutenant governor of the Punjab, who declared that the reforms effected by the Government of India Act were illusory. It was evident in 1921 that the high-handed policy of the government had only the reluctant consent of Montagu and Lord Reading, the new Viceroy. Matters came to a head in 1922 when Montagu's resignation was asked for, following his publication of a dispatch from the Indian government setting forth the objections of Mohammedans to the Treaty of Sèvres. Point was given to the matter by the evidences of acute disaffection in the Moslem communities. Outbreaks were prevalent in Malabar in particular; Moslems everywhere prayed openly for the success of the Turkish arms; protests were made against the dispatching of British forces to Constantinople. Meanwhile, noncoöperation continued unabated. In

spite of Gandhi's protests, violence was frequent; tax-collectors in particular were subjected to indignities. On Feb. 9, 1922, the government proceeded to a summary step by ordering the arrest of Gandhi on the charge of sedition. After a brief hearing he was found guilty and sentenced to prison for six years. Under the executive committee of the Indian National Congress the obstructionist tactics were carried on. At the meeting of the Congress late in 1922 the proposal to seek seats in the Legislative Assembly was rejected. Non-intercourse thus continued, and Gandhi's incarceration strengthened the resolve of the Nationalists.

In the following year, 1923, these matters appeared to be near a solution. With Gandhi in jail and the boycott of British-made goods a failure for economic reasons, it became increasingly evident that noncoöperation was doomed. As early as December, 1922, a group of influential members of the Indian Nationalist Congress had formed a new party for the purpose of contesting seats in the provincial and national assemblies, and this action merely presaged the subsequent events of 1923. The Indian Nationalist Congress, meeting at Delhi, September 15, was therefore advised by Gandhi to relinquish noncoöperation, at least for the time being, to permit its members to contest seats in the Legislative Assembly and provincial councils, and to drop the boycott of British-made goods. As far as participation in government was concerned, nationalists hastened to point out that their acceptance of the governmental machinery was for the purpose of employing obstructionist tactics rather than an indication of a change of policy. At any rate, this was the announced programme of the Swaraj party, headed by Das of Bengal; its strength was indicated by its gaining 50 seats of the total 145 in the elections for the second Legislative Assembly late in 1923, as well as a preponderating majority in the Central Provinces. Disorders did not abate. That Communism was gaining a foothold in India was indicated by the energetic steps taken by the government against suspects. There were outbreaks in the Punjab in midsummer; conflicts between the police and nationalists at Calcutta in July; and a perceptible antagonism between Hindus and Mohammedans which very often throughout 1923 revealed itself in open fighting. In the face of these disorders nothing revealed the short-sighted policy of the Indian government better than its inability to cope with situations such as these.

In July, 1923, the last session of the first Legislative Assembly closed. Its initial steps had been taken with so much caution that doubt was expressed in British circles as to whether its work was of a nature to justify its existence. The rise of the Labor party to power in Great Britain did not materially affect the situation. True, Gandhi was released, on Feb. 4, 1924, because of illness, Sir Sidney Oliver, appointed to the Indian Office was a champion of equal rights. But the British Labor government proceeded to reject the native Assembly's demand for a round-table conference on home rule; and point was given to this general attitude when Ramsay Macdonald issued a warning against the entertainment of too sanguine hopes. Hostility thus became general and outspoken once more. On March 17 the Swaraj majority re-

jected the government's budget in the Legislative Assembly, which had convened January 31; three days later, in spite of the recurrence of disorders, the Assembly voted to deprive the government of summary power. The only answer the British government could give to all this was the appointment of a commission to consider defects in the Government of India Act of 1919, and not a wholesale revision. It was plain in the summer of 1924 that militant nationalism was in the saddle, and that, as far as Indians were concerned, only one of two alternatives was feasible, i. e. home rule or complete independence.

INDIA RUBBER. See RUBBER.

INDIAN PROBLEM. See KENYA COLONY; SOUTH AFRICA, UNION OF.

INDIANA. Indiana is the thirty-seventh State in size (36,354 square miles), and the eleventh in population, capital, Indianapolis. The population increased from 2,700,876 in 1910 to 2,930,390 in 1920, a gain of 8.5 per cent. The white population rose from 2,639,961 to 2,849,071; Negro, from 60,320 to 80,810; native white, from 2,480,639 to 2,698,203; and the foreign-born white decreased from 159,322 to 150,868. The urban population of the State mounted from 1,143,835 in 1910 to 1,482,855 in 1920; the rural fell from 1,557,041 to 1,447,535. The principal cities of the State grew during the decade, as follows: Indianapolis (q.v.), 233,650 to 314,194; Fort Wayne, 63,933 to 86,549; Evansville, 69,647 to 85,264; South Bend, 53,684 to 70,983.

Agriculture. Indiana is one of the chief agricultural States, and general conditions during the decade 1910-20 were reflected by fluctuations in the local production and prices of the chief products, particularly grains. For a full discussion of this general situation, see AGRICULTURE, CORN, WHEAT, OATS, etc.

While the population of the State increased 8.5 per cent in the decade 1910-20, the rural population declined from 65.7 per cent in 1900 to 57.6 per cent in 1910 and 49.4 per cent in 1920. The number of farms decreased 4.8 per cent (from 215,485 to 205,126), the total acreage in farms from 21,299,823 to 21,063,332, or 1.1 per cent; and the improved land in farms from 16,931,252 to 16,680,212 acres. The total value of farm property, on the other hand, showed an apparent increase, from \$1,809,135,238 in 1910 to \$3,042,311,247 in 1920; the average value per farm, from \$8396 to \$14,831. Prices of farm land increased greatly, stimulated by war-time prices for products. In interpreting these values, however, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The percentage of land in farms decreased from 92.3 in 1910 to 91.3 in 1920, while the improved land in farms decreased from 73.4 to 72.3 per cent. Of the 205,126 farms in 1920, 137,210 were operated by owners, 2329 by managers, and 65,587 by tenants. The comparative figures for 1910 were 148,501, 2297, and 64,687. White farmers in 1920 numbered 204,554, compared with 214,680 in 1910; colored farmers, 572 compared with 805. The farms free from mortgage in 1920 numbered 73,233; those under mortgage, 51,474. In 1910, 89,847 farms were free from mortgage; 56,914,

under mortgage. The total number of cattle in 1920 was 1,546,095, compared with 1,363,016 in 1910. Dairy cows increased to 946,401 from 633,591; hogs, from 3,613,906 to 3,757,135; but sheep decreased to 643,889 from 1,336,967. The estimated production of the principal farm crops in 1923 was: corn, 201,473,000 bushels; spring wheat, 81,000; winter wheat, 34,188,000; oats, 48,909,000; rye, 4,186,000; barley, 965,000; potatoes, 7,308,000; sweet potatoes, 368,000; tobacco, 22,374,000 pounds; and hay, 2,470,000 tons. Comparative figures for 1913 are: corn, 176,400,000 bushels, wheat, 39,775,000; oats, 36,380,000; rye, 1,566,000; barley, 200,000; potatoes, 3,975,000; hay, 1,800,000 tons; and tobacco, 11,925,000 pounds.

Mining. Indiana ranked tenth among the States in the value of its mineral products in 1921. These are almost entirely nonmetallic; in order of their value, they are coal, cement, clay products, and stone. There is also a large quantity of petroleum. During the decade 1914-24, coal production showed considerable fluctuation, indicated by the following comparative values: In 1914 16,641,132 short tons, valued at \$18,290,928; in 1915, 17,006,152 at \$18,637,476; 1916, 20,093,528 at \$25,506,246; 1917, 26,539,329 at \$52,940,106; 1918, 30,678,634 at \$70,384,601; 1919, 20,912,288 at \$46,345,750; 1920, 29,350,585 at \$92,867,000; 1921, 20,319,509 at \$52,269,000. The production in 1922 was 19,132,889 tons; the decrease was due chiefly to the protracted coal miners' strike in the Middle West. Cement ranged from 9,595,923 barrels in 1914 to 10,050,433 in 1916 and 5,291,851 in 1918. The value of clay products showed a considerable increase, largely the result of the decreased purchasing power of money, and the consequent higher prices during the decade. The value in 1914 was \$7,655,285; in 1918, \$7,950,926; in 1920, \$15,494,795, and in 1921, \$11,199,024. The output of stone increased in value from \$4,136,132 in 1914 to \$8,985,036 in 1921. Petroleum production during the decade varied from 1,335,456 barrels in 1914 to 769,036 in 1916; 877,558 in 1918; 1,158,000 in 1921, and 1,087,000 in 1922. In addition to the minerals noted above, the State produces coke, sand and gravel, and pig iron. The total value of the mineral production in 1921 was \$97,700,676, compared with \$146,736,294 in 1920; \$82,270,784 in 1919; \$96,558,784 in 1918, and \$42,864,267 in 1914.

Manufactures. Indiana is an important manufacturing State. It has 31 cities with a population over 10,000, and six of these, Evansville, Fort Wayne, Gary, Indianapolis, South Bend, and Terre Haute, have 50,000 or more. Of these cities, 29, with a combined population of 37.8 per cent of the total for the State, had, in 1919, 62.5 per cent of the value of the manufactured products. There were in the State, in 1909, 7969 manufacturing establishments; 8022 in 1914, and 7916 in 1919, while persons engaged in manufacture numbered 218,263, 233,270, and 330,145. The capital invested in those years amounted to \$508,717,197, \$666,363,232, and \$1,335,714,103. The value of the products in 1909 was \$579,075,046; in 1914, \$730,795,021, and in 1919, \$1,898,753,387. The large increase in the value of products is, however, due largely to the change in industrial conditions brought about by the War and cannot properly be used to measure the growth of manufactures during the census period 1914-

19; but the increase in the number of wage earners clearly indicates a decided growth in the manufacturing activities of the State. The first industry in point of value of products is that connected with iron and steel works and rolling mills, the value of which in 1909 was \$38,652,000; 1914, \$58,883,000, and 1919, \$199,274,000. Slaughtering and meat packing ranks second, with \$47,289,000 in 1909; \$51,022,000 in 1914, and \$134,029,000 in 1919. Automobiles are third, valued at \$23,764,000 in 1909; in 1914, \$29,389,000, and in 1919, \$179,065,000. The manufacture and repair of steam railways had products in 1909 worth \$9,498,000; in 1914, \$21,570,000, and in 1919, \$86,021,000. Indianapolis is first among the cities of the State in manufactures, having, in 1909, 853 establishments, with a product of \$126,313,000; in 1914, 886 with \$139,700,000, and in 1919, 1004 with \$398,667,000. In South Bend there were, in 1909, 218 establishments, with a product of \$27,855,000; in 1914, 250 with \$31,180,000, and in 1919, 214 with \$75,339,000. Similar figures for Fort Wayne were 230 with \$23,687,000 in 1909; 1914, 228 with \$30,205,000; 1919, 247 with \$76,713,000.

Education. Indiana has always been in the forefront among the States in the interest of its citizens in education, and great progress was made during 1913-23. In 1913 the Legislature enacted three measures which had an important effect on the schools of the State; the vocational educational law, the high school inspection law, and a compulsory attendance law. Succeeding Legislatures amended these laws and passed others. The Legislature of 1920 enacted a minimum wage law for teachers, fixing the minimum at \$800, which became effective in 1920-21. The general Senate of 1921 enacted a compulsory attendance law providing that employment certifications shall not be issued until a pupil has completed the elementary school course. The establishment of a division of teacher training in excellent work was followed by improvement in ability of the teaching force. In 1921-22, 98 school corporations conducted schools in one or more of the fields of agriculture, home economics, and industry, with nearly 20,000 pupils enrolled. The Division of Vocational Rehabilitation, charged with the duty of returning physically disabled civilians to profitable employment, was eminently successful. In 1922-23, the General Education Board made a comprehensive investigation of the public school system of the State and recommended sweeping changes in regard to a State school administration, local school administration, and the training and certification of teachers. The enrollment in the public schools in 1914 was 548,497, including both elementary and high school; in 1921-22 it was 589,763, with 494,760 in elementary and 96,930 in high schools. The expenditures for elementary schools in 1921-22 amounted to \$26,830,588, and for high schools, \$10,133,628. The percentage of illiteracy in the State decreased from 3.9 in 1910 to 2.8 in 1920. Among the native white population it fell from 3 per cent in 1910 to 1.8 per cent in 1920; among the Negro, from 17.5 to 11.7; among the foreign-born population illiteracy increased from 11.8 to 12.4.

Finance. See STATE FINANCES.

Political and Other Events. There was much political activity in Indiana during the decade 1914-24. Elections were held in 1914

for congressman, United States senator, and several State officers. Although the Democratic vote showed a decrease of about 10,000, Senator Shively, Democrat, was reelected. The Democrats also elected 11 representatives to Congress. Charges of election frauds in Vigo and other counties resulted in investigations which brought about the arrest of the mayor of Terre Haute, two judges, the chief of police, the sheriff, other officials, and nearly 100 citizens. In June, 1915, 128 men, including some of the most important politicians of the State, were indicted by the Marion County grand jury; several pleaded guilty. In the presidential election of 1916, both candidates for vice-president were residents of Indiana. As a result of the election the Republican Party was returned to power in the State; James P. Goodrich was elected governor. Owing to the death of Senator Shively in 1916, it was necessary to elect two senators. James E. Watson and Harry S. New, both Republicans, were the successful candidates. In the voting for president in 1916, Charles E. Hughes received 341,005 votes; President Wilson, 334,063. In 1917 the mayor of Indianapolis, Joseph E. Bell, and other officials were indicted for alleged election frauds during the campaign of 1914. In the elections of 1918, the Republicans elected the entire State ticket. On Aug. 2, 1918, the State came under the operation of the "bone dry" prohibition law. Elections were held in 1920 for governor and other State officers and United States Senator. Warren T. McRay, Republican, was elected governor, and James E. Watson, Republican, was reelected United States senator. In the voting for president in this year, Warren G. Harding received 696,370 votes, James M. Cox, 511,364. In 1921 a special election was held on September 26 for the ratification or rejection of 13 proposed constitutional amendments adopted by the Legislature in 1919 and 1921. One amendment, conferring full suffrage on women and prohibiting aliens from voting until they were fully naturalized, was adopted; the others were defeated. In the primary elections of 1922, Albert J. Beveridge, nominated for United States senator, defeated Harry S. New. The Democrats nominated Samuel M. Ralston, former governor of the State. In the November elections, Mr. Ralston was elected senator. On Mar. 31, 1921, the mayor of Gary, Roswell C. Johnson, and other officials, were found guilty of a liquor conspiracy and were sentenced to fines and terms of imprisonment. Gov. Warren T. McRay was indicted for fraudulent misuse of the mails and for other offenses in 1923, and in 1924 he was found guilty and sentenced to a term in the Federal prison in Atlanta. In the presidential primary elections of May, 1924, President Coolidge defeated Hiram W. Johnson.

Legislation. Following are the most important acts of the Legislature in the decade 1914-24. In 1915 several important measures were passed, relating to electoral reform and liquor regulation, and also a workmen's compensation law. The Legislature of 1917 passed an act providing for a constitutional convention, granted women the right to vote, and enacted a State-wide "bone dry" prohibition law which went into effect on Apr. 2, 1918. On Jan. 14, 1919, the Legislature approved the National Prohibition Amendment. At this session was enacted a measure giving the State

Board of Tax Commissioners power over State and local levies and municipal bond issues, and women were given the right to vote for president. The Legislature recreated the legislative reference bureau which had been permitted to lapse in 1917. Measures were also passed forbidding the display of the red flag or any other symbol or emblem calculated to excite hostility or violence against the government. The Legislature of 1921 enacted a pure agricultural seed law, provided for the creation of an executive State budget, authorized cities to create city planning and zoning commissions, and provided for a commission to make an educational survey of the State. In 1923 the Legislature passed a measure for establishing equal rights for women, abolishing the legal disability of married women to make contracts and allowing them to hold property as if single. At this session, the penalties for violating the prohibition law were increased, and a uniform stock transfer act was passed.

INDIANAPOLIS. The capital and largest city of Indiana. The population rose from 233,650 in 1910 to 315,746 in 1920, a growth of 30 per cent, and to 342,718, by estimate of the Bureau of the Census, for 1923. A city planning commission of nine members was created in 1921, and in the year following a comprehensive zoning plan with distinct use, height, and area districts was adopted. The city purchased the privately owned reduction works in 1918; in 1924 it was engaged in building a new sewage plant using the activated sludge system, which, when completed, was expected to be the largest of its kind in the world. Two municipal theatres were established in 1922 in the public parks, and free entertainments were given. National headquarters of the American Legion were established in Indianapolis. The number of industrial establishments increased from 886 in 1914, employing 31,971 persons and making products valued at \$39,700,016, to 1215 in 1922, employing 56,000 persons and making products valued at \$427,100,000; the capital investment rose from \$87,569,251 to \$220,250,000. Bank clearings increased from \$414,612,000 in 1914 to \$910,881,000 in 1922, new building from \$7,933,081 to \$26,038,579, the assessed valuation from \$310,000,000 to \$605,000,000 and post office receipts from \$1,542,032 to \$3,307,943.

INDIANA UNIVERSITY. A coeducational State institution at Bloomington, Ind., founded in 1820. It has the following divisions: College of Arts and Sciences, Graduate School, School of Education, School of Law, School of Medicine, School of Commerce and Finance, School of Music, and Extension Division. The work in the School of Medicine is done at Bloomington and at Indianapolis. The 27 buildings were valued at \$1,842,263. The new commerce and finance building, costing \$235,000, was completed in 1923, and a stadium with a seating capacity of 22,000, costing approximately \$150,000, was under construction. There were 155 members of the faculty at Bloomington and 50 members at Indianapolis in 1923. During the decade 1914-24, the attendance increased from 2620 to 4837. The income increased during that time from \$396,216 to \$1,492,265, and the number of volumes in the library rose from 99,760 to 157,066. By the close of 1923 more than \$1,000,000 had been subscribed toward a goal of \$1,600,000 for the erection of memorial

buildings; and the campaign to raise \$2,000,000 for the construction and equipment of the James Whitcomb Riley Hospital for Children had passed the halfway mark, while the first unit of the hospital was nearing completion. President, William Lowe Bryan, Ph.D.

INDIANS (UNITED STATES) The American Indian continued to be on the public conscience. In the latter part of the nineteenth century the policy of assimilation was projected as the greatest possible good that could be meted out to the Red Man. By education and civil discipline the members of the race were to be inducted gradually into citizenship and established upon parcels of land as farmers, and of this land they were to attain full ownership. Each Indian was to be allotted a farm and settled thereon. It was then contemplated that the Indians, as individuals, would merge into the national population and cease to concern the government and the public as a problem. While the theory upon which this policy rests is sound and ethical, the fundamental difficulty lay in that the Indian was still a dependent and that those administering his wardship were naturally averse to relinquishing their power. The Indian lands were surveyed, divided into farms, and allotted to individual Indians. The surplus lands were then sold or thrown open to white settlers. As the Indian was a ward, and inexperienced, he had little chance of getting the land allotments best suited for farming, and in consequence he often found himself assigned to worthless land, or to land whose cultivation would require expensive and complicated equipment. It is not strange then that he failed to become self-supporting and thus delayed his release from guardianship.

Another factor was important. Only a small portion of the Indian tribes were native agriculturists, and farming did not appeal to them; to become farmers meant a radical turnover in their lives. The resistance thus caused, together with the frequent unsuitableness of the lands allotted, greatly delayed the consummation of the national Indian policy with regard to the Indians as a whole. It is obvious therefore that the day is far distant when there will be no Indian wards to look after. For instance, the Bureau of Indian Affairs in 1924 was renting out more than 16,000,000 acres of land and cared for personal property of Indians to the value of approximately \$200,000,000.

Naturally, during the War public attention was drawn away from the Indian, except for the laudable part his young men took in the conflict; but with the close of the War and the centering of attention on the nation's internal affairs, several events served to bring this problem to the fore again. Among these was the Pueblo Indian land question. A bill was introduced into Congress providing that the white claimants to Pueblo Indian lands and water rights in New Mexico should be recognized without regard to the right of the Indians and that if in this way the Indians were deprived of sufficient land to support them, then the National Government should remove them to other lands. It happened that these Indians held their lands under titles from the Government of Mexico, which were granted by treaty between the United States and Mexico when the territory was taken over at the close of the Mexican War. The proposed legislation so aroused public sentiment that the

bill was withdrawn and new legislation framed which in 1924 was pending enactment. Whether the Pueblo Indian would receive his due in full remained problematical. One beneficial result of this agitation was to bring into review the whole land policy of the Indian Bureau and to halt for the time a number of land bills and lease projects. For the time being, at least, all such questions were to be held pending public discussion.

About the same time the Commissioner of Indian Affairs issued a pronouncement against Indian dances, a term which, as used in the Indian country, meant any kind of social or religious gathering. This policy, if rigidly enforced, would stop all ceremonial and traditional practices except those favored by government officials. The demands for such prohibition came in the main from religious organizations and were aimed at the native Indian religion. Thus another fundamental issue was raised, this time a question of religious freedom. In the first place all those interested in art and Indian lore, a large part of the traveling public, the leaders of Boy Scout and similar organizations, etc., were aroused, chiefly because these people had come into an understanding of the serious side of Indian life and desired that the Indian should have fair play. They saw no reason why the Indian should not be accorded full religious freedom and the right of peaceful assembly, even if some of his practices were considered unchristian. It was pointed out that Jew, Mohammedan, and Mormon were free to set up their churches where they would, and that so long as the Indian obeyed the law, he should have the same privilege.

As a matter of fact, the past policy of the Indian Bureau had been not to interfere with native ceremonies except in respect to unlawful practices. Such practices were rare, and their prohibition did not greatly interfere with the Indian's religious freedom. Naturally the pronouncement of the Indian Commissioner, which seemed to threaten all native practices, even the care of the sick, aroused the Indians themselves, or at least all who were not completely Christianized. Opposition spread rapidly among the whites also, and led to the organization of the Indian Defense Society. The idea back of this organization was an advanced view of the right of a social group to work out its own adjustment to modern conditions. In the matter of costume, for example, the effort of those having the Indian in charge was to force the aborigines to adopt the current style of shoes and dress and to give up their own idea of what is becoming; so the Defense Society was organized to defend the right of the Indian to exercise his individuality on the ground that modern costume and similar conventionalities are not essential to civilization or to Christianity.

The movements just enumerated were related to a survey of Protestant religious and educational work among the Indian tribes of the United States, under the auspices of the Inter-Church World Movement. This survey was begun in 1919 and a report published in 1923, over the name of G. E. E. Lindquist, on *The Red Man in the United States*. Unfortunately, this report did not deal with the work of the Roman Catholic Church, which had been in the field from the start, but it gave in great detail the number of Protestant churches, schools, financial support, etc., for each Indian Reserva-

tion in turn. It also commented upon the economic status for each and particularly the non-Christian influences to be observed. The statistics compiled showed that the annual contribution for Protestant Indian Missions is about \$750,000 and the number of Indians enrolled in the churches a little more than 30,000. The Catholic enrollment was estimated at 60,000. If the total number of adherents to all churches be counted, the estimate was for 80,000 Protestants and 65,000 Catholics. On the other hand, 46,000 were listed as pagan. The situation respecting schooling was stated as 70,000 children in school, 20,000 not attending, and 10,000 unprovided with school facilities. One effort of this survey report was to stimulate Protestant missionary efforts to convert the pagan Indians, and it was from this source also that the pressure came on the Indian Bureau for the forceful suppression of all vestiges of native Indian culture.

To add to the tensivity of the situation it should be remembered that in almost every tribe there were two factors, the Christian Indians and the pagans. The former were fired with the zeal of all new converts and were ready to advocate forceful measures to suppress their heathen brothers. Many of the protests and appeals to the Indian Bureau come from these Christian Indians, who would, in some instances, favor the arrest and imprisonment of any one attempting to observe a pagan form of worship. When Dr. Hubert Work became Secretary of the Interior in 1922, the Indian Bureau was facing protests on all the points mentioned. An Advisory Committee of One Hundred was named by the Secretary. On this committee were distinguished statesmen, educators, scientists, missionaries, philanthropists, and a few outstanding Indian leaders. A two days' session of this committee was held in Washington, Dec. 12 and 13, 1923, for the discussion of Indian policy, and a series of recommendations were made to the Secretary. These embodied general recommendations to increase the effectiveness of Indian schools, to provide adequate medical and health supervision and, while recognizing the value of missionary work among the Indians, to emphasize the right of the Indian to freedom of thought and religious belief. Perhaps the most significant pronouncement of the Committee of One Hundred was its resolution: "These same problems have faced the government for nearly fifty years. Regardless of progress actually made, the great objectives of our benevolent desires have not been attained. This situation and this history show the extravagance of all efforts which are not directed by the best ability, supported by adequate funds, or maintained by sufficient consistency." This statement seemed to accord with enlightened public opinion.

The fundamental ideal has been to make the Indian a citizen and thus destroy his identity. Progress toward civilization among the Indians was showing rapid strides. Everywhere the young men were seeking seasonal employment and thus gradually adapting themselves to the economic life of the country. Yet, reviewing the history of the Indian tribes during the last century, it is noted that few tribes have become extinct, and no matter how completely Christianized some of them may now be, the tribal group is maintained. The function of the tribal organization under these new

conditions is social. Also, the native language still survives in the home and the social circle. Naturally, these languages carry with them old elements of social procedure, ethics, and ideals, the background to Indian thought and aspiration, and so long as the memory of these survives it may be expected that the social nucleus of the tribe will persist, but it will for the most part be valued for its æsthetic qualities. The Indians of New York State, for example, have been in direct contact with civilization for a long time, but they still maintain a number of social and ceremonial procedures peculiar to their forefathers. It is, therefore, evident that so long as Indians maintain their tribal communities, they will tend to preserve their native tongues and to hold on to a core of social traditions and aspirations. In course of time, however, this will be outside of the main affairs of life which will become in all respects American and so put the Indian on the same level as other racial blocs in the national population. The student of social phenomena have, however, from time to time protested against the overambitious forcing methods of missionaries and educators, on the ground that the transition must be gradual, or the individual will be wrecked. In the meetings of the Committee of One Hundred, attention was called to the entire collapse of morale in a number of tribes by the hasty destruction of traditional procedures. The plea of scientific men is for a policy based upon knowledge of primitive life, a policy that will efficiently as well as humanly conserve the native's wellbeing to the end that he may normally grow into citizenship.

Finally, a bird's-eye view of the Indian in the United States may be obtained from the following statements compiled from the reports of the United States Indian Bureau. The population in 1923 totaled 344,303 a gain of about 18,000 in ten years. There were 200 reservations and 193 Indian tribes, speaking languages of 58 different stocks. Two-thirds of the Indians were citizens, and about 50,000 were voters. In all about 240,000 Indians were still under government guardianship. Allotments of land were made to 227,000 Indians, 38,000,000 acres in all. There were, however, more than 125,000 Indians, on 91 reservations, to whom lands had not been allotted, and a reserve acreage of 35,000,000. The economic status of the Indian indicated progress. There were 40,962 farmers, cultivating 800,700 acres of land. Their cattle were valued at \$35,000,000; 366,000 acres of land were irrigated, with more than a million acres in reserve. The timber resources on Indian lands were estimated at 35,000,000 board feet, valued at \$100,000,000. The total value of property owned by Indians was estimated at \$1,000,000,000. Tribal funds held in government trust were more than \$25,000,000 and those of individual Indians approximated \$35,000,000. During the War \$25,000,000 in Liberty Bonds were purchased by Indians, and 12,000 served as soldiers. The oil lands are chiefly in the hands of the Osage and the five civilized tribes of Oklahoma, the per capita return of the former amounting to about \$12,000 per annum. To 1924 the total received by all these tribes reached the sum of \$150,000,000.

While most Indians live in houses built by themselves, there were still twenty tribes living in primitive dwellings: 11 in Arizona, three

in California and New Mexico, and one each in California and New Mexico, and one each in Colorado, Florida, and Nevada. Housing is closely correlated to health. The prevailing diseases are tuberculosis and trachoma; of the former there are 25,000 cases, of the latter 30,000. The insanity rate is very low, about 0.5 per thousand. One asylum is maintained where 106 were treated in 1922. About a dozen additional cases are scattered among State institutions. The Indian Bureau has a staff of 150 regular physicians on full duty at reservations and schools and 50 contract physicians on part time; 80 nurses and 70 field matrons are employed. There are 78 hospitals with a combined capacity of 2400 beds. Twenty thousand Indians were treated in these hospitals in 1922.

Education is provided in three classes of schools, boarding schools, government day schools, and the nearest public schools. Of government boarding schools on the reservations there were 51; off the reservations, 25. These had a combined attendance of about 18,000. In addition there were 36 private or mission schools enrolling more than 5000 children. The day schools numbered 181. In the local public schools adjacent to reservations were enrolled 34,301 Indian children for whom the government paid in tuition about \$250,000 per year. In general, there were 91,968 Indian children, 6279 of whom were ineligible for school attendance, but 20,746 children were without school facilities of any kind. The total appropriation for the education of the Indians was \$5,000,000, but this did not include the amounts expended by missions. See also ETHNOGRAPHY.

INDUSTRIAL ARBITRATION AND CONCILIATION. See LABOR ARBITRATION.

INDUSTRIAL CHEMISTRY. See CHEMISTRY, ORGANIC.

INDUSTRIAL DEMOCRACY. The theory of industrial democracy and its partial application in a number of cases was almost entirely a development of the decade 1914-24. Although vague ideas of this sort had manifested themselves before the War, it was the War and the resulting industrial conditions which brought forth the fully developed theory. It derived its chief elements from socialism and syndicalism (q.v.) and found its best expression in the philosophy of the British guild socialists. In its strict sense industrial democracy stands for the elimination of the capitalist employer, the introduction of democratic principles in industry, and the control of the means of production by the producers. It aims at the substitution of the motive of service to society for that of private profit in production and claims that thus all productive activities would be placed on a higher ethical level. The producers in the shop and single industry would exercise full control over everything relating to production. The basis of organization would be the shop and the industrial union, and the ultimate form would be a system of modified syndicalism rather than of socialism. In this sense industrial democracy still remained a theory or a philosophy. Where its application had been attempted, as in Russia, it had been a failure, although this was perhaps not entirely due to defects inherent in its theory. In the wider sense, the term industrial democracy had come to stand for a number of schemes involving partial application of its principles and the sharing of the worker in the control of in-

dustry. These schemes ranged from plans for full control to profit-sharing arrangements. Foremost in this respect were the shop stewards, the Whitley councils, and the builders' guilds in Great Britain, the shop councils in Germany, and the Plumb Plan in the United States.

Shop Stewards. This movement grew out of the hostility of the rank and file during the War to the trade union officials who under the Treasury Agreement of 1915 had abrogated the trade union rights and were therefore powerless to act as the spokesmen of the workers in serious labor disputes. It was, moreover, a revolt against the division of British trade union organization into local branches based on residence rather than on shop and industry. Because of the inactivity of the regular trade union officials under these conditions, energetic and aggressive men among the workers in various shops began early in the War to assume the leadership in their particular shops and thus to set aside the regular union officials. These shop stewards, as they were called after an analogous system long established in the mining industry, represented their fellow workers, though without official authority, in all disputes over hours, wages, and shop conditions. They soon became the accepted leaders of the men in their shops. The shop steward system prevailed primarily in the engineering trades. Its underlying principles were industrial unionism and the control of the shop by the workers. It was essentially syndicalist in nature. Aside from arbitrating ordinary disputes, they, and especially the more revolutionary among them, led all the strikes in the munitions industries. With the disappearance of war conditions the essential principles of the system were taken over by the trades affected and the movement in its revolutionary aspect came to an end. The shop stewards did not proceed very far in gaining control over production, but the system contained potentially all the essential elements of workers' control.

Whitley Councils, or Joint Industrial Councils. These councils were also a development of war conditions. The Whitley Committee, appointed in 1916, recommended joint, standing, and industrial councils as the means for adjusting relations between employers and workers. The councils were to represent employers and workers alike, were to have permanency to guarantee regular discussion, and were to be formed along industrial rather than craft lines. The system was to be provided with a decentralized machinery, comprising district councils and work committees as well as national councils. The British government adopted the report in October, 1917, and in January, 1918, the first Whitley council was formed in the pottery industry. A second report by the Whitley Committee, October, 1918, recommending joint councils for trades where organization was weak or nonexistent, was not wholly adopted by the government. The system spread rapidly till 1920, after which no outstanding developments occurred. There were in existence, in 1924, 72 councils and 11 interim reconstruction committees. The great industries, however, had not adopted the system. The formation of the councils had been mostly along uniform lines. They were composed of equal numbers of manufacturers' representatives and members of trade unions. They considered such questions as wages, hours, working conditions,

health, and sanitation. The councils had not led to any joint control of industry but in many cases had established amicable relations between the employers and workers. They had one important though unintended result, in so far as they stimulated trade union organization in the industries where they were applied. For the builders' guilds, see **GUILD SOCIALISM**.

Shop Councils. The German shop councils system was an offshoot of the revolutionary Workers' and Soldiers' Councils of 1918 and 1919. The Shop Councils Act of Aug 18, 1919, was a compromise; yet it went further in establishing workers' control than almost any other system actually applied. It provided for the creation of councils representative of the employees of all industrial establishments employing more than 20 workers. The functions of the councils were "to look after the interests of the workers in relation to the employers and to support the employer in fulfillment of the purpose of the works." The councils had the right to appoint one or two members of the board of directors to represent the workers in regard to organization. They might also demand from the employers information on such matters as affect the workers, as well as a quarterly report and an annual balance sheet. The councils became an integral part of the German trade union organization, which exerted a moderating influence on them. After 1919, the employers' organizations succeeded in curtailing materially their powers, but from the latter part of 1923, the shop councils had become more aggressive and of greater importance in the German labor movement.

Plumb Plan. This plan, named after its author, Glenn E Plumb, general counsel for the railway brotherhoods of the United States, was merely a proposal which had not been given realization. It is remarkable, however, for its features and for the support which it received. The plan proposed government purchase of the railways and ownership by a national railways operating corporation, the board of directors of which was to consist of 15 members, five chosen by the workers, five by the officials of the railways, and five by the government. Rates would be fixed by the Interstate Commerce Commission and wages by a wages board appointed by the directors. Profits would be divided between the government and the corporation. Those of the latter would be paid out as dividends to the employees. When the net profits exceeded 10 per cent of the gross working capital, the rates would be correspondingly reduced. The plan, although sharply criticized by the English guild socialists for its tameness, would go far in establishing workers' control. The railroad brotherhoods sponsored the plan, and the railroad bloc in the American Federation of Labor obtained the endorsement of that organization for the plan and for a programme of industrial democracy, in the conventions of the Federation in 1920 and 1921.

Individual employers in the United States had established various systems whereby the workers were given some sort of share in the industry. These ranged from simple profit-sharing schemes like that of the United States Steel Corporation to actual participation in the control of the industry. Remarkable was the system set up in the clothing industry in Chicago, which provided for a trade board of five, of which two were representatives of the manu-

facturers, two were members of the Amalgamated Clothing Workers, and the fifth was an impartial chairman. The board dealt with wages, hours, working conditions, health, sanitation, and similar matters. In reality, the impartial chairman decided practically all disputes.

INDUSTRIAL WORKERS OF THE WORLD. A labor organization founded in Chicago, in 1905, by a group of radicals who were discontented with the conservative policies of the trade unions. It is based on so-called "industrial union principles," and on the theory of syndicalism. In the first years of the decade 1914-24, the organization took a conspicuous part in strikes.

In 1917 disorders were created in the copper mines in Bisbee, Ariz. The sheriff of the county deported over 1100 members over the line into New Mexico. There was much suffering as a result of lack of food and the Federal government intervened and supplied them with necessities until they were able to remove elsewhere. The headquarters of the organization were raided on Sept. 5, 1917, by Federal officers. The avowed purpose was to check an alleged country-wide conspiracy to hamper the government in the prosecution of the War. William D. Haywood (q.v.), General Secretary, and 167 associates, were arrested. Their trial was begun on Mar. 3, 1918. Ninety-five were found guilty. William D. Haywood and others were sentenced to serve twenty years in the Federal prison or to pay \$20,000 fine each. During 1919 the development of the so-called "one big union" movement gained considerable headway. In principle it signifies a strike in all industries in sympathy with strikes in any single industry. The movement met with great sympathy in the I. W. W. On November 11, 1919, during a parade of overseas veterans in Centralia, Wash., firing took place from an I. W. W. hall and six of the paraders were wounded, three of whom later died. The leaders of the organization in Centralia were at once arrested and a general round-up of members was made. The "one big union" movement continued to develop in 1920. The affiliation of the I. W. W. with the Communist political doctrines grew steadily closer in the years following the War, and by 1922 it had practically become identified with the Communist party. Delegates were sent to the meeting of the Third International, and political action supplemented the industrial activities of the organization. The Communist element dominated the convention of the Farmer-Labor party in May, 1924, and succeeded in nominating Duncan MacDonald as candidate for president. The National committee, a few days later, withdrew these names and endorsed the Workers' Party candidate. This party comprises the organized communists of the country. William Z. Foster and Benjamin Gitlow were nominated as president and vice-president, respectively. Several of the States, notably California and Washington, passed measures against syndicalism in an effort to suppress the aggressive activities of the organization. A number of members who were imprisoned on charges of treason and sedition, were released in 1924. See **SYNDICALISM**.

INFANTILE PARALYSIS. In 1921 a new serum treatment for this disease was announced by Dr. Rosenow of the Mayo Foundation. This was obtained by injecting horses with cultures of a bacterium known as *streptococcus poly-*

morphus. The good effects of this serum had been known as far back as 1917. During the interval it had been tested on 259 children between the ages of five and seven years. In 60 of the patients the injections could be made at the inception of the disease, before the super-vention of the paralysis, which means during the first 36 hours; and in this series not a single death or paralysis took place, showing 100 per cent control of the disease. In 61 other cases, paralysis had already set in, and the injections could not be given until 48 hours of the disease had elapsed. Nevertheless the results were almost as good as in the first series, for no deaths and but one case of permanent paralysis resulted. In the third series of 125 cases, treatment could not be begun until the fifth or sixth day of the disease; and in this series eight deaths occurred and 30 children were left paralyzed, the balance making clean recoveries. In order to appreciate the value of this treatment it should be remembered that the average death rate is 4 per cent and that the number of children left crippled varies from 29 to 68 per cent of those attacked. The serum is injected into the muscles or veins; nothing is gained by injections into the spinal canal.

INFLATION. See FINANCE AND BANKING.

INFLUENZA. The pandemic of 1918 wrote a new and significant chapter in the history of this contagious disease. Up to that period it had been regarded commonly as an airborne affection, proof against isolation and quarantine; its spread by personal contact is now acknowledged by health authorities. Before the pandemic, influenza had been generally viewed as a relatively harmless but very annoying malady, dangerous chiefly to weaklings and through occasional complications. It is now known to be, potentially at least, the most pernicious of all diseases which attain pandemic diffusion, deadlier even than the pneumonic plague, which in some ways it strikingly resembles. When influenza is deadly it is because of the complication of pneumonia, and so prevalent was this complication in the pandemic that some clinicians came to regard the disease as essentially pneumonic, although under ordinary circumstances this feature is quite latent or suppressed. The custom of keeping the influenza patient in bed for a week, despite the insignificance of the symptoms, is due very largely to the belief that every case of influenza is a potential pneumonia and that the latter is apt to assert itself if the patient is up and about. Of great importance is the relationship between pandemic influenza and ordinary seasonal winter grippé. The latter in most localities has been regarded as a legacy of the older pandemic of 1890, although winter grippé is known to have existed in certain localities, Minnesota, for example, long before that year. There are notable differences in epidemicity, for while winter grippé, as the term implies, is an affection peculiar to cold weather, true influenza appears just as readily in the spring, summer, and autumn as in winter. Winter grippé is not highly contagious, although in the cold months there are better opportunities for the spread of a disease. In regard to the bacterial cause of winter grippé, four or five separate germs have been accused at different times, notably Pfeiffer's bacillus, the pneumococcus, strep-

tococcus, micrococcus, catarrhalis, etc. That is, each of these organisms seems capable at times of setting up a relatively benign epidemic catarrh without any special tendency to dangerous complications.

In pandemic influenza none of the above organisms can be associated with the contagion of the disease, although the deadliness was due to the special virulence of the pneumo- and streptococcus, responsible for the peculiar type of fatal pneumonia so often seen. To explain the pandemic we must invoke the existence of a highly diffusible contagious principle which in addition to smiting the great majority of those exposed further lowers the resistance to the ordinary ubiquitous disease-bearing germs, so that under the circumstances these acquire unusual virulence. This statement at once provokes the question, "Why have so many pandemics and extensive epidemics of influenza in the past pursued so mild a course, with hardly any mortality?" The answer to this query is in part as follows. The pandemic of 1918 lasted from May of that year to May, 1919. During this period there were at least three distinct waves. The first, which occurred in late spring and early summer, was distinctly mild. The second wave, in late summer and early fall, was very severe, decidedly malignant. The third wave, in the winter of 1919, was also malignant, masking the ordinary seasonal grippé. Hence, judging from analogy, the virulence of the disease, at first mild, gathered force during the second and third outbreaks, as a result of continuous passage through human bodies. This law of increasing virulence is familiar in experimental and clinical pathology. To return to the subject of the cause of pandemic influenza, this lies between Pfeiffer's bacillus and the so-called *bacillus pneumosintes*, studied at the Rockefeller Institute. Since the pandemic entirely disappeared, leaving us in the presence of only the ordinary seasonal grippé, we can only study the relationship of this organism to future pandemics and to respiratory catarrhal affections in general.

An attempt may be made here to reply to a few pertinent questions which are often asked or which concern popular delusions. Did the pandemic of 1918 originate in Spain? There is no evidence to support this belief. Influenza was common in fighting troops during 1917; in the United States Army alone, more than 40,000 men were attacked, both at home and in France. Influenza of decidedly virulent type was seen again in March, 1918, in widely different parts of the world, America, France, and the Far East. The disease gradually gathered force and chanced to break out in Spain during May on a huge scale. No doubt this Spanish outbreak did much to spread the disease to Africa and South America, but it played no part in communicating the disease to the North American continent; on the contrary, the weight of evidence favors the belief that the scattered episodes in the United States early in 1918 played a major rôle in causing the European outbreak through the crossing of our soldiers at this period. We know that contagious diseases flourish when foreign troops are moved about. No doubt a part of our pandemic in the early fall could be traced to Europe, but by no means all, for the disease appeared among us in more than one focus. Another question concerns immunity. Is seasonal grippé a pre-

ventive of epidemic influenza? There is every reason to believe that there is no decided immunity in influenza of whatever form. In fact, one attack often paves the way for another, which suggests that different microorganisms may induce the same clinical behavior. A third question refers to the apparent contradiction in mortalities. Influenza was often likened to the plague in deadliness, but this result is apparent only in nation-wide figures. Influenza may attack nearly every one, but the death rate does not usually exceed 2 per cent of those attacked. Plague pneumonia attacks relatively few, but its mortality is very high—almost or quite 100 per cent. See BUBONIC PLAGUE.

INGE, WILLIAM RALPH (1860–). A British prelate and man of letters (see VOL. XII). He has been dean of St. Paul's (London) since 1911. In the front rank of contemporary British essayists, he is known, on account of his vigorous criticism of certain modern tendencies, as "the gloom-dean." His later writings, which continued to appeal strongly to a discriminating public in the United States as well as his own country, were: *Types of Christian Saintliness* (1915); *The Philosophy of Platonism* (1918); *Outspoken Essays* (1919; 2d series, 1922); *The Idea of Progress* (1920); *The Victorian Age* (1922); and *Personal Religion and the Life of Devotion* (1924). Of these, *Outspoken Essays* were perhaps the most widely appreciated in the United States.

INGERSOLL, GEORGE PRATT (1861–). An American diplomat, born at New Haven, Conn., and educated at Trinity College and the Yale Law School. For several years he practiced law in Stamford, Conn., and New York City. After serving on several official boards in Connecticut, he became minister to Siam (1917–18). On his return to the United States he engaged again in the practice of law. He was delegate to the International Peace Conference in Washington in 1910. His published addresses include *The Measure of Success, Our Connecticut Heritage, and Diplomatic Life in Siam*.

INGLIS, ALEXANDER JAMES (1879–1924). An educator and author of educational books; born at Middletown, Conn., and educated at Wesleyan University (Conn.). He became assistant professor of education in 1914, and in 1919, professor of education, at Harvard University. During the War and later he was engaged as expert in important educational investigations and surveys for both the Federal and State governments. Besides text books for Latin courses, he wrote *Rise of the High School in Massachusetts* (1911); *Principles of Secondary Education* (1918); *Virginia Public Schools* (1919); and *Intelligence Quotient Values* (1921). He also edited a series of books on the theory and practice of education.

INHERITANCE TAX. See TAXATION IN THE UNITED STATES.

INJUNCTION. When Congress in 1914 passed the Clayton Act, greatly restricting the use of injunctions in labor disputes, its action was hailed by labor as an important victory in its long fight to curtail the use of injunctions. In the years immediately following, encouragement was also given to labor in State legislation. In 1917 an interesting tendency was disclosed in the Northwest to free strikes from injunctions and at the same time to punish violence severely. Minnesota forbade the issu-

ance of injunctions in trade disputes except to prevent irreparable injury to property and prohibit their issuance to prevent termination of employment. The act does not curtail the power of the courts if irreparable injury to business or property is threatened by violence or unlawful acts or acts involving criminal syndicalism. Utah passed a law similar to the Minnesota act, adding that injunctions must not interfere with "peaceful persuading." In 1919 legislation was passed in Iowa, North Dakota, Oregon, Washington, and Wisconsin to limit the use of injunctions. Nevertheless, the courts, both Federal and State, continued to issue injunctions in labor disputes in ever increasing numbers and in terms more and more strict. While it is the established law in the United States that laborers may under no circumstances be enjoined from quitting work, still in some injunctions "conspiring to quit" was enjoined. The courts resorted generally to the conspiracy theory in issuing injunctions against acts not in themselves unlawful in labor disputes. In some notable injunctions union officers were prohibited from advising or ordering workmen to go on strike or from paying strike benefits. A notable injunction of this type which aroused widespread interest was secured by the Federal government during the bituminous coal mine dispute of 1919.

More injunctions were issued in connection with labor disputes in 1922 than in any previous year. At least twice as many were issued by the Federal courts in this year as in the entire 10 years preceding. Included among the 1922 injunctions was a judicial order which prevented the officers of the Brotherhood of Railway Station Employees from calling a strike sanctioned by a referendum vote. Another was a judicial order, subsequently materially modified by a higher court, which enjoined the United Mine Workers from attempting to unionize a West Virginia coal district. But overshadowing all others was the injunction which the Attorney General of the United States secured from a Federal judge in Chicago against the railway shop crafts. This injunction, which aroused a storm of public discussion, was so broad that it practically forbade the strikers from doing anything, peaceful or otherwise, toward winning the strike. The use of injunctions in labor disputes which labor maintains is an abuse was increasing to such an extent that by 1924 it had become a political issue of considerable importance. The American labor movement endorsed the independent candidacy of Senator Robert M. LaFollette, whose platform declared vigorously in favor of abolishing the use of injunctions in labor disputes. Both the Republican and Democratic party platforms ignored the injunction issue, an issue on which the American Federation of Labor had made a 30 years' fight. See PICKETING.

INMAN, SAMUEL GUY (1877–) A clergyman and writer on South American topics, born at Trinity, Texas, and educated at Columbia University. He engaged in educational and missionary work in Mexico in 1906, and after 1915 was secretary of the Committee on Cooperation in Latin America. He wrote *Christian Cooperation in Latin America* (1917); *Intervention in Mexico* (1919); *Through Santo Domingo and Haiti* (1919); *South America Today* (1921); *Problems in Pan-Americanism*

(1921), and other works on Latin America; and founded and directed the monthly magazine, *La Nueva Democracia*.

INSANITY. Insanity, to judge from reports of various localities, during the period 1914-24, was increasing more rapidly in the United States than the population, and the housing shortage cannot explain the overcrowding of institutions and the use of property intended for other purposes to shelter the insane. As foretold by the late Dr. P. Bailey and others, prohibition has not produced any material lessening of the disease as a whole. Bleuler, the eminent Swiss alienist, found that the so-called chronic alcoholic insane are all original victims of *dementia præcox*, of which their alcoholism is merely a symptom or surface phenomenon. It is probable that the number of cases of transient alcoholic insanity has lessened, although not in some of the large centres of population, where the prohibition laws are flouted and commitments to the municipal institutions are numerous. The teaching of psychiatry is undergoing a constant shifting, and the two principal types of insanity which are of obscure origin, i.e. early dementia and manic-melancholic insanity, seem to be regarded more and more as symptoms rather than as independent affections. Their autonomy has never been admitted by alienists of the Latin races, and such diseases are not even described in their treatises on psychiatry. German authors seem to be receding from this standpoint, as originally taught by Krapelin and widely endorsed in the United States. Kretschmer has written to show that the individual who develops precocious dementia and he who becomes a victim of manic-melancholic insanity have opposite types of mind, a duality which is shared by all mankind. All men, in other words, have schizoid or cycloid characters. Others have taken up this teaching with modifications, notably Bleuler and Jung. A large literature on temperament and character has sprung up. It is important that the two be not confused, for while temperament is of physical origin, character is much deeper. Temperament is due to the rate of production of internal secretions and to the rapidity of metabolism, while character is bound up with introspection and extrospection, or as they are technically termed, extroversion and introversion. A man of temperament is usually extroverted, lives wholly in the external world, is eminently active and social, but has in him no tendency to advance. He is not a reflective man and never looks within himself. The introverted man divides his attention between the outer and inner worlds, reflects much, and is apt to dwell on past events; this brooding gives him certain character traits.

This distinction agrees in a measure with the sanguine and bilious temperaments of the ancients. Most of the evolutionary progress of the race of man is due to the introvert. Most of the disagreements between individuals and groups and the impossibility of compromise is based on fundamental differences in character. Neither side is capable of understanding the viewpoint of the other, and each is apt to regard the other as inhuman. In the young introvert the outer and inner life may become so dissociated that dementia is the consequence. Alienists agree that it is often impossible to draw a line between an ordinary unadjusted adolescent and a victim of beginning *dementia præcox*. On the other hand, when the tempera-

ment which underlies the extrovert is present in an extreme degree the subject develops maniacal tendencies or at the other extreme melancholic tendencies. A general increase in insanity means an increase in these basic forms, and as we have no practical knowledge of causal factors which can be influenced by treatment, the outlook is discouraging. Bleuler states that a child may sometimes be seen to pass from extroverted to introverted and vice versa, and it should be possible to place a normally introverted child or youth in an environment in which extroversion is favored. It is also conceivable that an extroverted child could be placed in such a dull environment that it would become introverted. Thus an extroverted individual sometimes becomes introverted after a long illness or confinement in prison. The world needs plenty of individuals of both types.

Of great significance is the work of Dr. Henry Cotton of the State Hospital for the Insane at Trenton, N. J., begun about 1918 and founded on the belief that much insanity is of toxic origin and due to absorption of pus from small dépôts in the teeth and other foci. Those eligible for treatment based on necessary surgical intervention belong to the so-called functional insanities. As a result of this pioneer work, an insane asylum for custodial care has for the first time been transformed into a hospital in which patients are treated and often cured. The percentage of cases of functional insanity which respond to treatment sufficiently to permit of discharge from the institution was at last accounts no less than 86. This means that from 1919 to 1924, the State has saved the sum of \$400,000. In all the insane, the tonsils should be removed and all purulent foci in the teeth and jaws, as shown by X-ray diagnosis, should be removed. Next to the mouth the pelvis is the chief source of mischief in these cases, especially in women. Thus far the Trenton Hospital appears to be the only institution in which this doctrine of surgical intervention has been carried out. Should these findings be corroborated, it is evident that surgery can be of still more importance in the prevention of functional insanity.

INSECT CONTROL. See ENTOMOLOGY, ECONOMIC.

INSECT PESTS. See ENTOMOLOGY, ECONOMIC.

INSTINCT. As used in psychology, the term indicates an inherited psychophysical disposition on the part of the human organism which serves as a determinant of future activity. As defined by McDougall, an instinct is purposive in character; that is, it goes out to accomplish a definite biological end. It is therefore distinct from the motor mechanism, which serves simply as a means for the accomplishment of the biological purpose. Under such a definition, there would naturally be as many instincts as there are specific hereditary purposes. In McDougall's *Outline of Psychology* (1923) is given a list of 14 major instincts and a half dozen minor instinctive responses so mechanical in their nature that they are not accompanied by any display of emotion. In addition to these specific dispositions of the mind, McDougall postulates nonspecific tendencies and faculties. Included among these are intelligence, defined as "the capacity to improve on native tendency in the light of past experience," sympathy, etc. It is evident that the nonspecific dispositions serve as the link to bind up the

isolated instinctive responses into the unified activity of the organism, much as the general staff of an army directs the movements of the specific arms and branches. Indeed, Professor McDougall takes the analogy of the army command rather seriously, as is evident from the monadology he exposed in his Presidential Address to the British Society for Psychical Research (1920). Here he frankly conceives of the human personality as organized on an imperialistic basis, with superior monads controlling the activities of the lower orders.

Professor McDougall first formulated his general theory of instincts in 1908, in his classic *Social Psychology*. At that time the only rival conception was that of Thorndike, who in his *Educational Psychology* conceived the instinct as a chain of reflexes, a very complicated chain of reflexes, but withal a mechanical system. Professor McDougall says of an instinct that "when brought into play, it generates an impulse, an urge, or a desire for some change in the situation that evoked it, an impulse which keeps the organism uneasy, restless, striving in this way and that so long as it is not inhibited by a stronger impulse or satisfied by the attainment of its natural goal, the changed situation of a specific kind." To Professor Thorndike, on the other hand, such a view smacks of "magic potency." He prefers to describe the operation of a particular instinct as a series of situations and responses. These responses, because they are determined, are predictable in the same way that the reactions of chemical elements are predictable. No room is left for potentialities, for changes in fundamental reactions, or for profiting by experience in the way that Professor McDougall allows. Nevertheless the Thorndike conception has for its advantage, or for what may be claimed as an advantage, its scientific disinterestedness from morality, purpose and value. The dichotomy between these two rival conceptions is the dichotomy that is presumed to separate disinterested science from practical morality and religion. As far as this dichotomy applies to psychology, it may be dramatically studied in Paul Bourget's novel, *The Disciple*. The author makes the hero commit a revolting crime as a consequence of his adherence to a deterministic psychology, under which the study of moral values is taboo. The proponent of these psychological doctrines, who had had no notion of the immoral ends for which such principles might be used by his disciples, is made at the end of the book to see the folly of his scientific positivism, and to speculate on the mysteries of religion.

Strange to say, the violent polemical discussions of the problem of instincts during the decade and a half following the publication of the *Social Psychology* were never able to get beyond the popular antithesis of mechanistic science and practical morality. On the mechanistic side positions have been put forward even more radical than those of Professor Thorndike. Among these might be cited as typical the point of view of Z. Y. Kuo. Refusing to accept even the Thorndike conception of instinct as an integrated series of reflexes, he would explain all human activity on the basis of nonspecific "units of reaction." "The reaction units are what we find in the child's spontaneous activities and random acts. . . . Such spontaneous and random acts are all that we can credit to the native endowment of man. These are nonspecific instincts, for they are reflexes in char-

acter and involve few, if any, complex neural patterns." In his emphasis on reflexes, Mr. Kuo was following the lead of Watson and the Behavioristic movement, but even Professor Watson assumed that beyond the mere random reflexes there exists a group of innate reactions or instincts. Those who have attacked McDougall's conception of instinct have attempted to assimilate it to the notion of "innate ideas," thereby hoping to bring on instinct the discredit that has fallen on the so-called Cartesian rationalism. The value of such tactics is questionable, inasmuch as the problem of "innate ideas" and the problem of instincts are at bottom one and the same. The doctrine of "innate ideas" is, properly speaking, a caricature of Cartesianism prepared by its opponents, the British empiricists; but the general issue as defined by the opposing stands of Descartes and Locke is still one of the central questions of philosophy.

Regardless, however, of the relation of instincts to the doctrine of innate ideas, the conception of McDougall is a difficult one to employ in a scientific scheme modeled on a positivistic or rather a materialistic interpretation of physics and chemistry. It is a conception that fits in better with a practical system of moral conduct, preferably of the conservative sort.

Proof of the latter fact may be had in the embarrassment of Prof. John Dewey in his handling of the instinct problem. Addressing the American Psychological Association in December, 1916, he hailed the work of McDougall and Thorndike, between whose theories he drew no distinction, as laying the basis of a new social science. "Henceforth," he said, "our social psychology is placed on the sure ground of observation of instinctive behavior." Scarcely two years later in his Princeton lectures of 1918, published in book form under the title of *Human Nature and Conduct* (1921), he expressly repudiated McDougall's theory in the interest of his own belief of social radicalism and did not see fit to adopt the Thorndike conception of reflexes. The view which he did elaborate, while admitting the probable existence of instinctive roots for human conduct, tried to explain this conduct on the basis of a succession of impulses and habits. The instinctive part of our habits, he appeared to maintain, does not come into being until the habits are formed under the stress of environment. In this manner he avoided committing himself to McDougall's fixed classification of instincts, which had been the subject of much attacking, without offering any other classification. The artifice of placing the chapter on instinct after the chapter on habit is open to criticism, inasmuch as in mechanistically determined systems potentialities are treated as fixed quantities long before they pass into the active state. The beauty of physical science lies in the fact that potential energy may be measured just as accurately as kinetic energy, or energy in motion.

One of the unfortunate aspects of the list of instincts propounded by McDougall is that while the units are presumed to function specifically they are yet denominated by the vaguest terminology. The list, including their synonyms, is as follows: instinct of escape (of self-preservation, of avoidance; danger instinct); combat (aggression, pugnacity); Repulsion (repugnance); parental (protective); appeal; pairing (mating, reproduction, sex-

ual); curiosity (inquiry, discovery, investigation); submission (self-abasement); assertion (self-display); social or gregarious instinct; food-seeking (hunting); acquisition (hoarding instinct); construction, laughter. Around these major instincts are grouped the corresponding primary emotions (such as fear, anger, disgust, etc.), and in this way a certain air of system is given to the treatment of the affective life which is lacking in most other psychological textbooks. It is this air of system which is, however, responsible for a great deal if not most of the controversy. The notion that there exists any fixed entity as an acquisitive instinct naturally irritated those who had hoped to find in social psychology a support for their radical views on social progress, and at the same time it seemed to lend "scientific" color to the eternal necessity of a capitalistic order. The instinct of pugnacity, if taken with the same seriousness as the laws of mechanics, automatically condemns pacifism. Many similar difficulties arise in connection with the other instinctive concepts. For a long time sociologists and social psychologists were in turmoil over the question whether there really existed any such instinct as the instinct for imitation, around which the French psychologist, Gabriel Tarde, had built up by a tour de force the entire scheme of social movement. And great was the relief when both Thorndike and McDougall legislated this instinct out of existence, McDougall preferring to explain the phenomena of imitation by the concourse of intelligence with the specific instincts.

Almost any philosophy of instincts tends to undermine the prestige of the intellect and intelligence. A theory of mechanical reflexes tends of course to abolish intelligence altogether, but under the conception of fixed instincts the intelligence is reduced to the rôle of a helpless mediator between the imperious inborn tendencies of human nature. The notion of the sublimation of instincts, which has been so extensively used by the psychoanalysts and psychopathologists, consecrates anti-intellectualism into a dogma. It might be said that the metaphor of sublimation was invented in order that it might be misinterpreted. At any rate it owes its popularity to the ease with which it lends itself to distortion. When the highest intellectual achievements of humanity are defined as mere sublimations of primitive instincts, it is only a short step in the popular mind to de-throning these achievements altogether and preferring "self-expression" via the so-called instinctive urges. In this respect the genius of modern social psychology works directly opposite to the genius of dogmatic religion, which, while adopting an almost identical hierarchical division of human nature into instincts and faculties, regards the instincts as the domain of the devil and "sublimations" as the striving for divine perfection. In this day and age it is not possible to write of human nature in the fashion of a sermon, but the question may well be asked whether the end of science is in any way served by pointing a moral in reverse. To sum up the present situation in the doctrine of instincts, we should say that there exist two dogmatic positions, the theory of specific instincts and the theory of mechanical reflexes. Of these two, the instinct is the more flexible and could be converted at will into a dogmatism for morality or into a dogmatism against good morals. Perhaps the larger number of present-

day psychologists might be regarded as skeptics, vacillating between the acceptance of teleological instincts and the apparently more scientific concept of reflexes. If we are to find a way out of this dilemma, we must seek it in a philosophical re-interpretation of scientific experience.

The lines of this re-interpretation can be only briefly suggested here. To begin with, the accepted notion of predeterminism in physical science must be subjected to analysis. And when this is done, it is found that the so-called pre-established laws of nature are discovered in the course of human history, or rather are organized as an objective test of experience through the constructive mathematical genius of man. And it is also seen that the physical laws are presumed for reasons of convenience to have preexisted their discovery by man. The late Henri Poincaré showed clearly that we cannot ask ourselves the question whether the laws of physical nature have ever undergone change, inasmuch as our notions of geology and astronomy, the history of the earth and of the heavens, are based on the assumption that the laws are constant. While we are able to predict the revolutions of the stars on the basis of our present scientific laws, nobody can pretend to predict the revolutions in the science of astronomy, precisely because of the unpredictable nature of the "human equation." The so-called mechanism of physical science, invented by human intelligence, cannot be used as a club to prevent the progress of human intelligence. Indeed, the notion of intellectual progress or evolution was recognized long before man had the audacity to apply that very fruitful idea to biology. But the essence of evolution or progress is the notion of genuine change or novelty occurring within time. As regards the physical world, we may say with the French proverb, *plus ça change, plus c'est la même chose*; the more things change, the more they remain the same. But while we often apply the same idea to human affairs, we do so satirically, and as regards biological phenomena, we have definitely postulated the notion of growth in the unifying principle of evolution. There can be no mechanical theory of evolution for the reason that the formula is a logical contradiction. The general principle of mechanism undertakes to explain change in physical phenomena by attributing it to preexistent conditions, while the principle of evolution undertakes to explain the variety of living species as a genuine development in time. The two principles contradict each other only when we attempt to apply them to the same set of phenomena, but in their formal nature they both reflect the mathematical idea of continuity.

If we should admit, then, the contingency of the laws of physical science, their contingency, that is, on the state of our ever changing knowledge of nature, there need be no opposition in the spirit of scientific inquiry between natural science and the biological and social sciences. Phenomena in the latter domain are obviously not as predictable as purely physical phenomena are. The proper analogy for the biological series is geology, a science in which we attempt to predict the spatial configurations of the earth's crust before we are able to see them. In the same empirical fashion we predict economic phenomena, but the accuracy of our predictions is dependent on the nonintervention of new factors. Philosophically speaking, the theory of teleological instincts and the notion of reflexes can both be conciliated into the scheme

of science if we throw out on the one hand the prejudice of purpose and on the other the prejudice of mechanical predeterminism. Neither of these has a place in a descriptive science. The instinct becomes the larger unit, and for that reason harder to measure; the reflex is the smaller unit and more accurately determined, but it is too small for social computation. It is as if we were to try to formulate the principle of the pulley in terms of electronic vibrations. While the notion of purpose and inner striving is thus excluded from descriptive psychology, it need by no means be banished from the world of thought as a delusion and a fraud. It finds its place in those disciplines which aim to cultivate inner development: art; religion; the philosophy of religion. It is not necessary for the science of man to be religious in order to cooperate with the religious striving, just as it is not necessary for the science of physiology to be healthy in order to further the interests of health.

INSULIN. See DIABETES; DIET; FOOD AND NUTRITION.

INSURANCE. Since insurance, although an independent business activity, is a financial tool for the furtherance of the more fundamental economic processes, its development may be expected to follow closely the outstanding developments in those processes. The history of the business during 1912-24 illustrates this tendency. Its volume increased with the rise in prices and the extension of general business activity. New forms of coverage were originated and old forms adjusted to changes in the need for protection. Within the insurance business, there was considerable activity in the organization of new companies and in the combination of old companies, particularly in the property insurance field, where individual insurance interests aimed to offer as wide a variety of coverages as practicable. The feature of the period which was most far-reaching in its influence on insurance, was the War with its effects on prices of securities and property. Fortunately the insurance companies were able to adjust the valuation of their investments on the basis largely of intrinsic worth and thus avoided in some measure the unfortunate effects of market fluctuation. The increase in prices brought about a corresponding increase in the amount of insurance required to cover the risk of loss of property and of other values. The War also had a marked effect on the moral hazard. It tended, in general to decrease the losses of insurance companies where property was covered whose loss would result in the cessation of large profits to business men. With

the close of the War, however, and the following period of adverse conditions in business, the preservation of property was less a matter of concern to its owners; consequently there was an increase in insurance losses, which must also be attributed, in large measure, to the moral hazard. Governmental regulation of insurance steadily increased in scope and effectiveness. The National Convention of Insurance Commissioners, through its committees and general meetings, succeeded in offsetting in considerable degree the disadvantages of regulation by the individual States. It put State regulation on a higher plane and brought about, unofficially, a relatively high degree of uniformity of laws; but much remained to be accomplished in this direction, for the companies were still embarrassed by diverse systems of regulation.

Life Insurance. On Dec 31, 1922, there were in force 14,875,540 life insurance policies, as compared with 7,452,154 on Dec. 31, 1913, an increase of 100 per cent. These figures are for companies reporting to the Insurance Department of New York State. All figures in this statement are from the same source unless otherwise noted. Insurance in force amounted to \$33,460,718,184 as compared with \$14,304,638,791, an increase of 134 per cent. In the same period, gross assets increased by 72 per cent and surplus by 79 per cent. A comparison of the new business written in 1922 with that written in 1913 shows an increase of 224 per cent, from \$1,792,342,656 to \$5,805,342,709. This increase is highly significant and is a better measure of the increasing importance of life insurance than are the other figures given, since these other figures are affected, in large measure, by totals continued from previous years. Aside from the unexampled activity of insurance companies and their agents, the principal reasons for this increase in new business are found in the inflation of prices during the period, necessitating the purchase of larger policies to insure a given standard of living to dependents, in increased ability of policy holders to pay premiums of considerable size; and in the discovery of many new uses for the application of life insurance both to personal and to business affairs. The rate of mortality of the general population as well as that among life insurance policyholders showed a tendency to decrease. This tendency was interrupted by the epidemic of Spanish influenza which was at its worst during 1918-19. Fortunately the life insurance companies were sufficiently well prepared financially to meet this catastrophe without impairing their solvency. The only loss to policyholders was represented by a slightly increased cost of insurance for a brief period. War activities as such had little direct effect on the mortality among policyholders of life insurance companies. The short time during which the United States was active in the War and the relatively small amount of insurance in force on the lives of actual combatants explain this fact. The war mortality was largely borne by the war risk insurance scheme organized by the United States government for the purpose of writing insurance on the lives of soldiers and sailors.

It has long been recognized that the American Experience Table of Mortality, on which the calculations of life insurance companies are largely based, is not accurate. An investiga-

tion of 60 of the principal insurance companies of the United States and Canada showed that the mortality among insured lives was considerably below that indicated by the American Experience table prior to the age of 50, although this table is approximately accurate beyond that age. The most important new development in the life insurance field was the insurance of employees of private business enterprises under contracts of group insurance, the premium for which was usually paid in full by the employer and the proceeds payable to the designated beneficiaries of the workers. From a small beginning in 1911 this business increased so rapidly that at the end of the year 1922 there were in force nearly 7000 policies of insurance. The period was further marked by the general adoption and liberalization of the disability clause in all types of contract with individuals and in the somewhat less general adoption of clauses providing for double or even triple indemnity in the event of the occurrence of accidental death. The unsound financial condition of many fraternal life insurance organizations had long been a problem for the authorities of the various States. There were, however, in effect in 1924 regulations under which the fraternal were required, if they were not already in a sound financial condition, to improve gradually until they reached a condition of solvency. Several important life insurance companies which were formerly operated as nonparticipating stock companies adopted the mutual principle.

Fire Insurance. Increase in the amount of property insured and increase in property values in terms of money resulted in an increase of 137 per cent in the insurance in force in fire insurance organizations, from \$51,202,402,351 on Dec. 31, 1912, to \$121,552,779,774 on Dec. 31, 1922. Premiums increased by 147 per cent, from \$454,943,419 in 1912 to \$1,124,869,302 in 1922; losses paid, by 119 per cent, from \$157,023,447 to \$345,951,143. Total estimated fire losses in the United States increased by 113 per cent, from \$206,438,900 to \$440,000,000 (*Insurance Year Book*, 1923). The ratio of fire insurance losses to premiums as calculated by the National Board of Fire Underwriters was unusually favorable during the decade and reached a point above the average for the years 1860-1923 in only two years, 1914 and 1921. In 1919, it reached the lowest point since 1863, when it touched approximately 40 per cent. In 1922, the ratio was approximately 56 per cent, the average ratio for the 63 years. In 1918, the New York Standard Policy, long the accepted standard in a large number of States, was revised to adjust it to modern conditions. An event of great importance in the regulation of fire insurance was the agreement between the National Board of Fire Underwriters and the National Convention of Insurance Commissioners that 5 per cent of earned premiums represented a reasonable profit for fire insurance carriers.

Marine Insurance. For the year 1918 the total net premiums received for marine insurance within the United States were estimated at slightly less than \$110,000,000 by Dr. S. S. Huebner. *The Insurance Year Book* presented a figure of \$63,040,443 for 1922, probably an underestimate. Ocean shipping during the War was subject to new hazards, partly due to enemy activities. The extent and even the nature

of these hazards were unpredictable, and they could be assumed by insurance companies only to a limited extent. Governmental bureaus were established in this country and in foreign countries to insure shippers against losses from war hazards. Without such aid shipping by private interests would have been, in large part, necessarily discontinued. Increased activity in foreign commerce during and after the War led to the organization of many new marine insurance companies and to the development of marine insurance by older companies. The business was written, however, to a considerable extent on an unsound basis, and after a period of feverish activity, most of the new organizations disappeared, and the business resumed its orderly course. In 1919, Congress became concerned with the preponderance of alien interests in the marine insurance business. An investigation was made, as a result of which a model marine insurance law, designed for the encouragement of American marine insurance, was adopted for the District of Columbia. With the coöperation of the companies and of Congress, three syndicates were organized for the purpose of increasing marine insurance facilities, in the interest, largely, of American carriers.

Miscellaneous Insurance. Among other forms of insurance, those covering the obligation of employers under workmen's compensation acts and the hazards incident to the ownership and use of automobiles became of greatest financial importance; each of these was responsible for the collection of, roughly, \$200,000,000 in premiums during the year 1922. Many new varieties of coverage were developed, all directed to the end of more completely meeting the needs of individuals and business for the assumption of risk. See FIRE PROTECTION, OLD AGE PENSIONS, SOCIAL INSURANCE, AND WORKMEN'S COMPENSATION.

INTERNAL-COMBUSTION ENGINES. It has been stated, from investigations made by the United States Department of Agriculture, that 68 per cent of all tractor engine troubles occur in the accessories essential to the operation of high-speed automobile power plants operating on the internal-combustion principle. These difficulties occur in magnetos, battery ignition parts such as the timer and induction coil, spark plugs, wiring and carburetors. Troubles due to mechanical failure in parts such as bearings, cylinders, pistons, rings, valves and springs and lubricating systems account for only 32 per cent of the stoppages. The fuel efficiency of engines using carburetors is considered satisfactory if they return in power one-fifth of the fuel energy present in the fuel supplied, and four-fifths of the fuel energy is wasted in automotive power plants used in small motor boats, motor vehicles, and airplanes. The fuel employed must be a particularly high grade liquid which must meet certain requirements of volatility and viscosity. In all forms of motor vehicles, the weight of the fuel must be transported by engine power. In all aerial craft especially, high fuel consumption means a serious reduction in cruising ability in cargo vessels and vehicles, a reduction in

available space that might produce revenue. For this reason, scientists are seeking to find means of utilizing fuels more efficiently, and considerable research work is being carried on to secure greater fuel economy in engines requiring high grade fuel as well as in the development of power plants that may utilize low grade and cheaper fuels economically.

Considering first what may be done with combustion in confined spaces or in those forms of engines using the explosive process as introduced by Otto, we find that the usual form of automotive engine using special ignition devices is much less efficient, if we consider heat utilization other than types of engines such as the Diesel, which have extremely high compression ratios, compressing only air and then injecting the fuel in the heated air in such engines, heat utilization as high as 30 per cent has been reached. The heat utilization of the usual form of automotive engine is from 20 to 25 per cent. To increase the heat utilization of the present type of engine is a problem which was being attacked in two ways. The attempt was made to develop fuels allowing use of higher compression pressures without pre-ignition. The addition of a small amount of tetraethyl lead to gasoline is said to permit of using twice the accepted compression pressure without pre-ignition and "knocking." This means that for a given piston displacement, the power can be doubled without using any more fuel, because the higher compression pressure which is possible doubles the force of the explosion. Again, some engineers were working on the problem of perfecting the combustion process. It was stated that with the fuels available commercially and the engine speeds and carburetion and ignition systems used, the combustion in automobile engines continues during the entire duration of the expansion stroke, and from 20 to 30 per cent of the fuel passes out of the cylinder unburned.

permit of as heavy charges being inspired, because of the throttling effect of the passages through which the gas must pass in reaching the cylinder interior on the suction stroke.

Injection Engines. While it is generally believed that injection engines are best suited to applications where a heavy-duty constant-speed power plant is needed, which precludes their use in most forms of automotive vehicles, excluding boats, a very startling development in this form of engine is the adaptation of the German Junkers engine to aeronautic purposes. This is a two-cycle type using two pistons per cylinder, working in opposite directions and uncovering two sets of ports open at the end of the stroke. Air under pressure is admitted through one set of ports for scavenging purposes, and this air pushes the exhaust gases out of the other. The only valves in the engine are the fuel injection valves, but it is in the development of this part that the designer of injection engines experiences the greatest difficulty. At high operating speeds and with engines of comparatively small dimensions, such as are needed in automotive vehicles, the injection valve becomes small and consequently is subject to mechanical troubles. Then again, in those forms of injection engines where the air is not compressed to high pressures, the shape of valve necessary to produce a good spray can be determined only by experimentation. It is also difficult to secure complete combustion of a fuel injected in the liquid state at high speeds; so the speed of injection engines and their flexibility cannot be compared with those forms receiving their fuel mixture from a carburetor.

Explosion Turbine. Some engineers believe that the explosion turbine offers possibilities for future development, because one of the drawbacks of reciprocating piston engines, i.e. the inefficiency due to incomplete expansion after ignition, is not inherently present. In some forms of explosion turbines, the mixture is

FORMS OF AUTOMOTIVE ENGINE COMBUSTION CHAMBERS AND TYPICAL VALVE PLACING

At left: Head with side valve head and combustion chamber to promote turbulence. At right: Overhead valves to permit quick charging and exhaust of gases.

One of the best methods of increasing or accelerating combustion in automotive engines is by designs of cylinder heads to produce combustion chambers that will promote turbulence. A violent turbulence means a more thorough mixing of the liquid particles and the air stream, and engines employing this principle give better combustion, though in some cases they do not

drawn or forced into a special combustion chamber where it is exploded, and the pressure thus produced causes the gas to escape through a nozzle and impinge upon a turbine wheel. A sectional view of an internal combustion turbine built and operated in Germany by Holzwarth is shown. The design is ingenious, as the turbine is directly connected with a gener-

ator. Owing to the possibility of expanding the gas to atmospheric pressure, this turbine would have a theoretical energy utilization about 67 per cent if the combustion and fuel supply processes were the same as in a reciprocating piston engine.

One of the weaknesses of turbine design is that the compression of the charge prior to ignition does not take place in the explosion chamber but must be furnished by an outside compressor. Owing to the inefficiency of the

der. An explosion turbine is not a true internal combustion engine, and its low efficiency makes its commercial prospects not particularly bright. It requires a compressor, pump, or other device to supply the gas that is entirely distinct from the rotor element delivering the power and the combustion chamber where the charge is exploded and it is more complex than a reciprocating engine. It is stated that an external combustion or steam power plant will deliver an efficiency as high as 20 per cent when running on coal, this is 5 per cent greater than can be expected from the most efficient form of explosion turbine yet developed.

Diesel Engine. Many designs of Diesel engine were built for ship propulsion and received practical application during and after the War. In a discussion before the Society of Automotive Engineers, Inc., an authority on motor ship power plants stated that more than 50 different forms of engines for ship propulsion were on the market. These designs were stated to include:

- Two-cycle, with:
 - Air injection
 - Airless injection
 - Scavenge valves.
 - No scavenge valves
 - Combined scavenging and injection valves.
 - Scavenging pumps driven by cranks at the end of the engine
 - Scavenging pumps operated by rocking levers from the crossheads
 - Stepped scavenging pistons.
 - Separate electrically driven scavenging blowers.
- Four-cycle, with:
 - Air injection.
 - Airless injection.
 - Vertical inlet and exhaust valves.
 - Horizontal valves.

SECTIONAL ELEVATION OF THE HOLZWARTH VERTICAL EXPLOSION TURBINE

compressors and the fact that a turbine rotor actuated by a gas with constantly falling pressure cannot be more than 60 per cent efficient, the theoretical thermal efficiency of a turbine drops from 67 per cent to a practically realized efficiency of but 13.8 per cent, or considerably less than that of the usual forms of reciprocating piston engines. Several inventors have tried to do away with compressors in gas turbines, or, if a compressor was used, to drive it by steam raised by the exhaust of the turbine. One of the advantages of the reciprocating type of engine is that the piston serves as a pump to draw in the gas; then as a compressor to compact the charge before ignition; then as a power element when forced down by the pressure of the exploded, expanding gas; and lastly as a scavenging medium, when it pushes the inert or exhaust gas out of the working cylinder.

A THREE-CYLINDER DOUBLE-ACTING TWO-CYCLE 850 BRAKE HORSE POWER ENGINE

Variations, inclusive of.

- Trunk piston.
- Crosshead.
- Low compression, with auxiliary combustion-starting system.
- Medium compression with or without steam-heated cylinders.
- Medium compression with electric or red-hot point starting devices.
- Diesel combustion on one side and steam pressure on the other side of the piston.
- Single acting.
- Double acting.
- Opposed piston, and variations of this particular design.
- Use of cylinder liners.
- Nonuse of cylinder liners.
- Detachable cylinder heads.
- Cylinder heads cast integrally with the cylinders.
- Heavy cast-iron frames.
- Steel columns and no cast-iron frame.
- Both frames and columns of cast iron.
- Cylinders cast separately.
- Cylinders cast in block.
- V-type cylinders.
- Compound engines.

All of these have variations in their reversing mechanisms. Some have fresh- or salt-water-cooled pistons, others have oil-cooled pistons, and some have no cooling medium other than the atmosphere. Finally, there are advocates of the Diesel electric drive and of the Diesel reduction-gear drive as opposed to direct drive.

double-acting two-cycle engine. This power plant has a cylinder bore of $17\frac{23}{32}$ inches and a stroke of $27\frac{31}{32}$ inches and delivers 850 horse power at 120 revolutions per minute. The problem of packing the piston rod against the explosion pressure is met by a very ingenious and carefully worked-out stuffing-box which permits the piston rod to reciprocate through the head of the lower cylinder. The stuffing-box is very deep and contains 11 sections of metallic packing; grooved rings divide them, to facilitate the distribution of lubricating oil. Each section consists of two rings split in halves which fit closely around the rod without springs, but they are kept close to the rod by a spring clip ring carried in a retaining ring clear of the rod. These 11 sections are entered into the stuffing-box and held in position by the gland ring.

The Sperry compound oil engine, also illustrated, shows a great difference from the usual forms. The sturdy construction necessary for an engine of its speed is indicated by the size of the crankshaft, which is considerably greater in diameter than that of any other combustion engine and approaches the bore of the combustion cylinders themselves. The large clearance

TYPICAL INDICATOR CARD OF SPERRY COMPOUND ENGINE

The fuel consumption of motor ship engines ranges from a minimum of 0.29 pound per indicated horse power hour to 0.5 pound per horse power hour. The average is about 0.40 pound per horse power hour.

As an example of novel designing, the accompanying illustration gives a sectional elevation through one of the cylinders of a three-cylinder

dome, which forms the combustion-chamber of the compound, stands out in marked contrast to standard Diesel practice. This dome is large and forms an upward extension of the combustion cylinder; it extends also to the right in a large sweep and surrounds the transfer valve that seals the transfer port. The sleeve-like induction valve is seated on top of the transfer

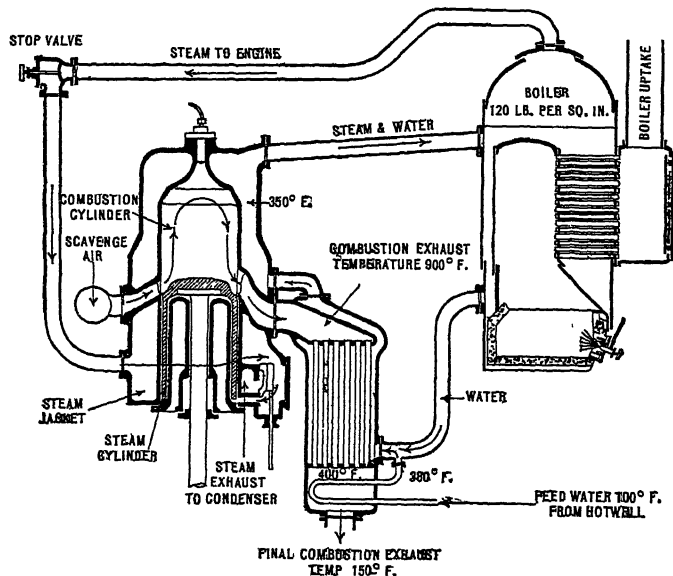

valve and is controlled by the cam-operated fork. The first-stage annular compression-pump, surrounding the trunk piston below the low-pressure piston proper, delivers its air to a small receiver which, in turn, discharges to the cored port surrounding the induction sleeve. The small balancing cylinder maintains a permanent connection with the low-pressure cylinder. The solid-injection fuel-valve and nozzle are placed approximately over the centre of gravity of the large masses of air in the clearance dome.

The compound principle as applied in this engine is an attempt to produce a light and compact internal-combustion engine using a wide range of fuels with ignition by the heat of the compression. The arrangement of the engine consists of two high-pressure four-cycle cylinders and a simple low-pressure cylinder. The high-pressure pistons are of plain trunk type. The low-pressure piston has an extension of smaller diameter than the main piston. The annular space between this extension and the main piston serves as an air pump. The pump compresses air from atmospheric to a moderate pressure into a small receiver. On the down or inlet stroke of the high-pressure pistons, air under pressure from the receiver passes through the inlet-valve sleeve and cools it, until the pistons are at the end of the stroke. The air is then compressed on the up-stroke to about 500 pounds per square inch when fuel is injected. The resulting combustion and expansion of the gases drive down the high-pressure piston to the end of its stroke, when the low-pressure piston, which is on the beginning of its working stroke, receives the gases from the high-pressure cylinder through the transfer port that has been opened by lifting the transfer valve from its seat into a water-jacket cavity so that only its lower surface is washed by the passing gases. To prevent any serious drop in pressure between the high- and low-pressure cylinders when the transfer takes place, the exhaust-valve is closed somewhat before the low-pressure top centre and the gases are cushioned to a pressure equal to that being transferred from the high-

pressure cylinder. The cranks of the two high-pressure cylinders are set together and 180° from the low-pressure crank. The high-pressure cylinders fire and transfer alternately into the low-pressure cylinder, so that every down-stroke of that cylinder is a working stroke.

In internal-combustion engines of either the constant volume or constant pressure type, the combined heat losses in radiation, cooling water, and exhaust gases range between 65 and 75 per cent. It will be evident that any practical attempt to utilize the waste heat will increase the thermal efficiency. Heat losses due to the cooling water or radiation cannot be reduced beyond a certain minimum value; so the point where the greatest gain can be made is in the fuller utilization of the exhaust gases. In the various forms of compound engines which have been evolved and described, with two high-pressure cylinders exhausted in one low pressure and further power derived from the exhaust gas, the reduced pressure is compensated for by the increased area of the low-pressure piston top. An attempt to utilize the waste heat of the exhaust gas is the Still engine, which combines steam and explosion power so advantageously that the brake thermal efficiency of such an engine may go as high as 44 per cent.

Still Engine. The still engine is an engine capable of using, in its main working cylinder, any form of liquid or gaseous fuel hitherto employed; it makes use of the recoverable heat which passes through the surfaces of the combustion cylinder as well as into the exhaust gases, for the evaporation of steam, which is expanded in the combustion cylinder itself on one side of the main piston, the combustion stroke acting on the other side. It increases the power of the engine and reduces the consumption of the fuel per horse power developed. Its primary object is not to use the waste heat for raising steam, but first to use it in improving the thermal conditions of the working cylinder and so to insure the maximum efficiency from the fuel burnt within it and to diminish, as a consequence, the heat lost in that operation. Since the maximum efficiency is obtained

TYPICAL MARINE DIESEL ENGINES

by combustion of the fuel in the cylinder, and the minimum by the evaporation of the water in the steam generator, it is evident that the larger the quantity of steam which can be generated per horse power developed by the combustion cycle, the lower must be the heat efficiency of the whole machine. Internal-combustion engines are kept cool by the circulation of cold water around their cylinders; the heat thus absorbed causes a rise in temperature of the water as it travels through the jacket, so that the cylinder is subjected to temperature differences and heat stresses, which are an abiding source of trouble and difficulty to the designer.

In the Still engine the jacket and cooling water form part of the circulating system of a steam generator, which may be an integral part of the engine or external to it. The cooling water therefore enters and leaves the jacket at a constant temperature, regulated by the pressure of the steam; the cooling is effected by converting the water into steam without raising its temperature. Excluding the radiation losses, which are kept low by lagging, all the heat which passes through the walls is thus usefully recovered in the water as steam. The temperature of the cylinder wall is uniform over the whole of its exterior surface, and the heat lost to the cooling water at each stage of the cycle, compression, combustion, and expansion, is diminished. During compression, because of the walls' being at steam temperature, the incoming charge picks up heat instead of losing it, during the greater part of the stroke. This is an advantage of the greatest value to the heavy-oil types of Still engine, where an air charge is taken in at the full out-stroke and is compressed to a pressure where its increased temperature insures the certain ignition and combustion of the fuel which is injected into it. During combustion and expansion, the uniform and higher mean temperature of the wall reduces the heat lost to the jacket water. Some of the heat thus economized adds to the useful work on the piston, the remainder passing out in the exhaust gases for recovery. The steam developed is directed to a special steam cylinder, and as it has some pressure, this is exerted against the bottom portion of the main piston which extends into the steam cylinder. Power at normal loads is developed by combustion and steam from waste heat alone, with an efficiency from 20 to 25 per cent greater than any known combustion engine of the same size. It is believed that there is a future for the combination of the steam and combustion cycles.

High Speed Engines. Engineers who are working on the development of high speed engines such as are used for automobiles and aircraft are not concerned so much with combustion efficiency as with securing as much power as possible out of a given cylinder volume; one of the mechanical aids to secure this result is the supercharger. While this device had not in 1924 been generally applied to passenger cars, it had been used on racing automobile engines and on airplane motors. Its function is to force a charge of more density into the cylinder than would be drawn in by the pumping action of the piston on the suction stroke.

Superchargers. Superchargers are especially valuable on aircraft operating at high altitudes. As the engine reaches altitudes where the air is lighter, the weight of the charge decreases and the power is correspondingly re-

duced. This loss of power is stated to be very great in engines not equipped with superchargers. A Liberty airplane engine that will develop 400 horse power at sea level will deliver but 200 horse power at 15,000 feet and not quite 90 horse power at 25,000 feet. While reciprocating,

The Exhaust Gas from the Engine Is Led through a Manifold, *a*, into the Nozzle Box *b*, containing a Series of Nozzles, *c*, through Which the Gas Expands and Attains a High Velocity before Entering the Buckets of the Turbine Wheel *d*, Which It Drives at High Speed. Air Enters the Impeller *e* through the Inlet *f* at the Center and Is Thrown by Centrifugal Force to the Tips of the Blades where a Series of Vanes Convert the Velocity of the Air into Pressure and Guide It in a Spiral Path, as Shown at *g*, to the Supercharger Outlet and Finally to the Intake of the Carburetor *h*.

cating, rotary, and centrifugal air-pumps have been suggested and experimented with, the centrifugal type is best adapted for aircraft motors because of its simplicity, lightness, and freedom from pulsation. The supercharger may be gear-driven by the engine to which it is attached, or it may be driven by a gas turbine using exhaust gas which would otherwise be wasted by discharging it directly into the air. The gas turbine-driven supercharger had been most successful to date.

The diagram herewith shows clearly the way such a supercharger operates. The exhaust gas from the engine is led through a manifold *A* into a nozzle box *B* containing a series of nozzles *C*. Through these nozzles the gas expands and reaches a high velocity before entering the buckets of the turbine wheel *D*, which it drives at high speed. Air enters the impeller *E* through inlets *F* at the centre and is thrown by centrifugal force to the tips of the blades. At this point, a series of vanes surrounding the impeller converts the velocity of the air into pressure and guides it in a spiral path to the supercharger outlet and then through the air-cooler into the carburetor intake.

Vehicle and Aircraft Engines. In 1924, vehicle and aircraft engine design principles were to a very great degree based on the experience gained during the War in securing extreme care as to details. Airplane, car, truck, tractor, and tank were all developed by the severe tests of war. Engine speed is not limited by considerations of piston temperature, and improvements in design enable the designer to adopt large-bore cylinders in aircraft engines if he so desires. A British six-cylinder engine with cylinders of 7 inches bore and 11 inches stroke develops 700 horse power at a speed of 1200 revolutions per minute. Aluminum pistons had been used commercially for some time,

but the use of forged duralumin connecting-rods was comparatively recent.

Motor Car Engines. The marked development of aeronautic engines focused the attention of the public on light engines. In the case of such power plants, lightness is obtained mainly by machining out low-stressed portions of the various engine members and by making highly stressed parts of alloy steels carefully heat-treated so that less weight is required to

ARRANGEMENT OF CYLINDERS IN AVIATION ENGINE TO SECURE COMPACTNESS OF DESIGN IN MULTIPLE CYLINDER FORMS

attain the necessary structural strength. In order to secure the required power output in a compact and light engine, the usual tandem arrangement favored in automobile engines is replaced by radial placing of cylinders in which they are mounted on all sides of the crank-case, some engines having 2 and even 3 banks of 9 cylinders each. The V-cylinder placing is favored for 8 and 12 cylinder engines, and in some cases, the angle between the inclined cylinders is large enough so that another set of vertical cylinders can be placed between them. By such arrangements of cylinders, engines developing from 500 to 600 horse power have been built, weighing only 1.80 pounds per horse power. Air-cooled aeronautic engines have been built, weighing but 1.5 pounds per horse power. Speeds of crankshaft rotation on airplane engines are not as high as in automobiles, since the propeller efficiency limits the speed when directly connected to the crankshaft to about 1350 revolutions per minute, and with geared-down drive to 2000 revolutions per minute. Racing automobile and motorcycle engines have attained speeds in excess of 4000 revolutions per minute. See MOTOR VEHICLES and AERONAUTICS.

riculture belongs to the International Research Council. They created a Committee on International Auxiliary Language, located in Washington, D. C., under the direction of Dr. Nichols and Dr. Cottrell, which undertook to send out information generously to any serious inquirer. In 1924 the two chief solutions were an arrangement that would favor living languages, and an artificial language. The basis for discussion of an established living language to be used as an international language remained the "Projet Chappelier," suggesting an agreement between English and French speaking countries, that the first require in all their schools the teaching of French, and the second the teaching of English. This would force other nations to teach at least one of the two, and thus the goal would be reached. Famous men gave their support to the idea, among them Wells, Richet, and the great linguist Bréal. The best explanation of the plan is found in Dauzat's *Le Français et l'Anglais, Langues Internationales* (1910). It is unfortunate that Dauzat hurt his cause considerably by indulging in very unintelligent criticism of other solutions of the problem; nobody can see in him an impartial student. The plan was from 1915 endorsed by the well known critic, Ernest Charles, and by the American philosopher, Mark Baldwin. For some details and references see the various *New International Year Books*.

There were, of course, many projects of arti-

ficial languages before the public, but three really counted: Esperanto (for information in America, address Esperanto Association, Boston, Mass.); Ido (American headquarters in Pittsburgh); and Esperantido (Washington, D C). In 1922, the Institute of International Education launched a movement in favor of a modernized Latin, not so much, it seems, because of belief in it, but rather out of fear that an auxiliary language might otherwise triumph. From the first weeks of the War, Esperanto rendered extremely valuable service both in the Red Cross divisions, and in the work of the prisoners' camps. At the same time the Germans took advantage of Esperanto to spread much propaganda among neutrals, which naturally hurt the cause of Esperanto in the eyes of the Allies (who were slow at hitting back with the same arm). In 1916 the "Chappelier plan" was seriously revived, and Dauzat suggested some interesting modifications to it. In some quarters the end of the War was expected for the end of 1916 or beginning of 1917; in view of this the Board of Trade of London favored the study of the question of an international language to help business to pick up rapidly. At the same time, the Germans, seeing things take a favorable turn for them, began to talk about German as an international language, and spoke of a "Welt-deutsch," a natural organ for Pan-Germanism. But the War went on, and remarkable headway was made in 1917 and 1918 by artificial languages, especially Esperanto, in the Far East. Then, as the War ended, a lively race began between the chief rivals, Esperanto and Ido. Esperanto seemed to see a chance for victory in winning to its cause the exploited classes and even the Russian Soviets, while the Idists seem to prefer to win the intellectuals. Lord Northcliffe, in England, and the philologist Meillet, in France, agreed that as a language Ido was superior to Esperanto. This discussion of actual *linguistic* superiority prompted Dr. René de Saussure, of Bern, Switzerland, to offer his system, combining, he maintained, the excellent points of both Esperanto and Ido, and which he called Esperantido. The plan of a simplified Latin, proposed that same year by Professor Peano of the University of Turin, had a moderate following.

Together, these groups tried to bring the question before the Peace Council in Paris, and having elicited a note of "interest" from Wilson, worked with more vigor than ever. After the Peace Council, the League of Nations was approached several times. In 1921, the League delegated Dr. Nitobe to the Congress of Esperanto that was to be held in Prague, August 29 to September 6. The report, made on September 12, brought about the nomination of a committee to investigate the matter. The problem was finally turned over to the Committee on Intellectual Coöperation, of which such persons as Bergson, Einstein, and Mme. Curie were members; and these finally decided, in a report of Aug. 1, 1923, not to recommend an artificial language. Meanwhile, the International Research Council, which had met in Brussels in 1919, appointed a committee to investigate the matter of an artificial language "of the type of Esperanto" and which would be "placed under scientific control." After that time the Committee on International Auxiliary Language, at Washington, became active. They

asked the Philological Association and the Modern Language Association to appoint committees. Both made cool replies, but Washington went on. The question was brought up and discussed at the meeting of the American Association for Advancement of Science at Toronto, in December, 1922, and again at their meeting at Cincinnati in December, 1923. The study of the problem was endorsed. Some meetings in New York, April, 1923, with a view to fostering the cause, and counting among their supporters several names famous in the scientific world, must also be recalled. The most interesting bibliographical material bearing at least partly on this problem are the very suggestive book of A. Meillet, of the Collège de France, *Les Langues de l'Europe Nouvelle* (1918), last chapter, and A. L. Guérard, *Short History of the International Language Movement* (London and New York, 1922). IOWA. Iowa is the twenty-fourth State in size (56,147 square miles), and the sixteenth in population; capital, Des Moines. The population increased from 2,224,771 in 1910 to 2,404,021 in 1920, a gain of 8.1 per cent. The white population rose from 2,209,191 to 2,384,181; Negro, from 14,973 to 19,005; native white, from 1,935,707 to 2,158,534. The foreign-born white population showed a decrease, from 273,484 to 225,647. The urban population mounted from 680,054 to 875,495, while the rural fell from 1,544,717 to 1,528,526. The population of the principal cities increased, during the decade, as follows: Des Moines (q.v.), 86,368 to 126,468; Sioux City, 47,828 to 71,227, Davenport, 43,028 to 56,727; Cedar Rapids, 32,811 to 45,566.

Agriculture. As Iowa is one of the chief agricultural States, conditions during the decade 1910-20 were affected by the general fluctuations in production and values which resulted from conditions of the war and post-war period. See AGRICULTURE, CORN, and WHEAT. While the population of the State increased 8.1 per cent in the decade 1910-20, the number of farms decreased 1.7 per cent (from 217,044 to 213,439); the acreage from 33,930,688 to 33,474,896, or 1.3 per cent; and the improved land in farms from 29,491,199 acres to 28,606,951, or 3 per cent. The total value of farm property showed an apparent increase, from \$3,745,860,544 in 1910 to \$8,524,870,956 in 1920, or 127.6 per cent; the average value per farm from \$17,259 to \$39,941. Prices of farm land increased greatly, stimulated by wartime prices of products. In interpreting these values, however, and, indeed, any statement of comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes decreased from 95.4 in 1910 to 94.1 in 1920; and the percentage of improved land in farms from 82.9 to 80.4. Of the total of 213,-

439 farms in 1920, 121,888 were operated by owners, 2487 by managers, and 89,084 by tenants. The corresponding figures for 1910 were 133,003, 1926, and 82,115. The white farmers in 1920 numbered 213,330, compared with 216,843 in 1910; colored farmers 109, compared with 201. Farms free from mortgage in 1920 numbered 45,807; those under mortgage, 66,096; while in 1910 the mortgaged farms numbered 63,234, and those free from mortgage, 68,045. The total number of cattle in 1920 was 4,557,708, compared with 4,448,006 in 1910; dairy cattle, 1,519,510, compared with 1,406,792; hogs, 7,864,304, compared with 7,545,853; sheep, 1,092,095, compared with 1,145,549. The estimated production of the principal farm crops in 1923 was as follows: corn, 422,241,000 bushels; spring wheat, 756,000; winter wheat, 13,708,000; oats, 195,689,000; barley, 4,208,000; potatoes, 7,618,000; sweet potatoes, 378,000; and hay, 4,416,000 tons. Comparative figures for 1913 are corn, 338,300,000 bushels; wheat, 16,395,000; oats, 163,360,000; barley, 10,000,000; potatoes, 7,200,000; and hay, 4,440,000 tons.

Mining. The principal mineral products of Iowa are coal, cement, clay products, and gypsum. There is practically no metal mining in the State. The coal production during the decade 1914-24 showed considerable fluctuation, as will be noted from the following comparative figures 1914, 7,451,022 short tons, valued at \$13,364,070; 1915, 7,614,143, \$13,577,608; 1916, 7,260,800, \$13,530,383; 1917, 8,965,830, \$21,096,408; 1918, 8,192,195, \$24,703,237; 1919, 5,624,692, \$17,352,620; 1920, 7,813,916, \$30,794,000; 1921, 4,531,392, \$17,256,800; 1922, 4,335,161. The decrease in 1921 and 1922 was due largely to the protracted coal miners' strike which affected all the Middle Western coal fields. Shipments of cement were practically constant during the decade. They ranged from 4,224,076 barrels in 1914 to 3,188,669 in 1918 to 4,421,783 in 1920 and 4,151,439 in 1921. The value, however, practically doubled in the last three years of the decade because of the decreased purchasing power of money and the consequent higher prices. Clay products fluctuated from the value of \$6,401,745 in 1914 to \$5,313,394 in 1918 and \$5,711,583 in 1921. Gypsum is one of the most important mineral products: there were produced in 1914, 480,404 short tons; 1918, 327,927; 1920, 571,895; and 1921, 350,247. In addition to the minerals noted, the State produces mineral waters, sand, and gravel. The total value of the mineral products in 1921 was \$35,639,505, compared with \$57,250,480 in 1920; \$37,882,183 in 1919; \$38,742,009 in 1918; and \$26,287,115 in 1914.

Manufactures. Although Iowa is not one of the most prominent of the manufacturing States, it is of considerable industrial importance. There are 18 cities having a population of more than 10,000. These form 25.1 per cent of the total population of the State, and in 1919 they reported 78.4 per cent of the total value of its manufactured products. There were in the State, in 1909, 5528 manufacturing establishments; in 1914, 5614; and in 1919, 5683. The persons engaged in manufacture numbered 78,360, 82,631, and 105,439; and the capital invested amounted to \$171,218,604, \$233,128,542, and \$403,205,513, in those years. The value of the products in 1909 was \$259,237,637; in 1914, \$310,749,974, and in 1919, \$745,472,697. The chief industry in point of

value of product is that connected with slaughtering and meat packing, with a value of \$59,045,000 in 1909; \$74,289,700 in 1914, and \$226,865,000 in 1919. The manufacture of butter, cheese, and condensed milk ranks second in 1919, \$25,850,000; in 1914, \$27,606,000, and in 1919, \$57,800,000. Car construction and repair, in third place, had products valued in 1909 at \$10,269,000; in 1914, \$11,434,000 and in 1919, \$33,099,000. Flour and gristmill products were valued, in 1909, at \$12,871,000, 1914, \$14,337,000, and 1919, \$21,325,000. The large increase in value of products is due largely to changes in industrial conditions brought about by the War, and therefore cannot properly be used to measure the growth of manufactures during the census period, 1914-19. The increase, however, in the number of wage earners indicates a decided growth in the manufacturing activities of the State. The chief manufacturing cities are Cedar Rapids and Des Moines. There were in Des Moines, in 1909, 387 establishments, with a product valued at \$23,585,000; 1914, 384, with \$23,747,000; and 1919, 379, with \$59,831,000. In Cedar Rapids there were 153 establishments in 1909, with a product of \$24,824,000; 170, in 1914, with \$34,989,000; and 208, in 1919, with \$92,118,000. Other important manufacturing cities are Council Bluffs, Dubuque, Fort Dodge, and Muscatine.

Education. No State has devoted more attention to education than has Iowa. The result of this is indicated by the fact that it is lowest in percentage of illiteracy and that although the enrollment in the public schools decreased since 1900, the State losing in population during the two decades from 1900 to 1921, the average daily attendance showed a large increase. Particular attention was given to rural school problems, and in the supervision of these schools great improvement was shown. The General Assembly established the Standard School as a means of taking care of children and teachers in the rural schools, the Evans-Smith Law making an appropriation of \$100,000 annually to help the one-room school. The consolidated school had been in operation in the State for about 15 years but only latterly had rapid development begun in it. From 1918 to 1922 the number of consolidated schools practically doubled. Vocational education was introduced as a part of the educational system, and work started in agriculture, trades and industry, home economics, and teacher training; and in connection with this work civilian rehabilitation was carried on. In 1922 courses in vocational agriculture were given in 43 high schools. A law enacted by the 38th General Assembly requires that the subject of American citizenship shall be taught in all public and private schools in the State. In 1900 there were enrolled in the public schools 566,223, and in 1922, 543,430. However, with 22,793 fewer enrollments than in 1900, the average daily attendance in 1922 was 62,886 greater. The total attendance in all the schools in 1922 was 537,886, of whom 72,681 were enrolled in the high schools. Total receipts for educational purposes in 1921-22 were \$53,280,104. The percentage of illiteracy decreased from 2.2 in 1910 to 1.4 in 1920; among the foreign-born white from 10.3 per cent to 10.2; among the Negro from 15.9 to 11.2.

Finance. See STATE FINANCES.

Political and Other Events. The decade

1914-24 was not lacking in events of political interest in Iowa. As the chief interest in the State is agriculture, which was greatly affected by conditions following the War, the radical wing of the party which demanded legislation for the benefit of the farmers developed great power. It succeeded in electing its candidates for United States Senator and other offices. In 1914 there were elections for members of the House of Representatives, United States senator and governor. Henry Vollmer, a Democrat, was elected to the House, and George W. Clarke, the Republican candidate, was elected governor. Senator Albert B. Cummins was reelected. The Supreme Court in 1914 declared unconstitutional a "blue sky" law, regulating investment companies, passed by the Legislature of 1913. The political campaign in 1916 was particularly bitter, and local interest, to a large extent, superseded interest in the presidential election. W. L. Harding, the Republican candidate for governor, was elected, together with the entire State Republican ticket. For president, the vote was 280,499 for Hughes and 221,669 for President Wilson. In 1918, W. L. Harding was reelected governor. In 1920 elections were held for governor and other State officers and for United States senator. Albert B. Cummins was reelected to the Senate, and N. E. Kendall, Republican, was elected governor. In the presidential voting of this year, W. G. Harding received 634,674 votes and J. M. Cox 227,921. In 1922, William S. Kenyon, United States senator, resigned to become Federal judge, and Charles A. Rawson was appointed by Governor Kendall to succeed him. In the Republican primaries of June 5 of that year, Smith W. Brookhart, the candidate of the radical Republicans, won the nomination for senator against five opponents. In the election he was successful over the Democratic candidate, Clyde L. Herring. Governor Kendall was reelected for a second term. The people at this election voted in favor of the soldiers' bonus. In 1923 a special election was held to fill a vacancy in the House of Representatives. Hiram K. Evans, Republican, was the successful candidate in this election.

Legislation. The most important acts of the Legislature in the decade 1914-24 are noted below. The Legislature of 1915 passed several measures relating to liquor reform and liquor regulation. The so-called "mulct liquor law" was repealed. A bill providing for the submission of the question of prohibition to the people was passed, and also a measure providing for the submission of a woman suffrage amendment in 1917. The Legislature also enacted a stringent child labor law and abolished the contract prison labor system. In 1916 the Legislature provided a moratorium for men in the military and naval service and referred to the next session a constitutional amendment providing for woman suffrage. The Federal prohibition amendment was adopted by the Legislature of 1919, on January 15, and on July 2, the legislators ratified the woman suffrage amendment. The Legislature of 1919 passed special provisions permitting women to vote for president; it also passed statutes defining and punishing criminal syndicalism and sabotage. The Legislature of 1921 enacted no measures of special importance. A mandate of the people for a constitutional convention was not carried out. In 1923 the Legislature passed a measure

making a crime of the possession of drugs illegally obtained. It also enacted a law assembling activities relating to crime into a single department and a measure making the sale of narcotics a felony and abolished distinctions in voting between men and women. The law against the sale of cigarettes was modified by permitting the sale of cigarettes to adults in the State.

IOWA, UNIVERSITY OF. A coeducational State institution at Iowa City, Iowa, founded in 1847. The university expanded greatly during the decade 1914-24, with 7250 students enrolled in the year 1923-24, nearly three times the enrollment of 1913-14; a faculty of 500, as compared with 275 in 1914, and library facilities of 322,400 volumes, as compared with 174,000. Many buildings were put up during the period and new activities begun. The dentistry building was erected in 1917; a men's dormitory in 1919; the Children's Hospital, the Psychopathic Hospital, and a nurses' home were completed in 1921; a chemistry building was completed in 1923. In the latter year the restoration of the first statehouse of Iowa, the university's administration building, was nearing completion, and a large recitation hall of Bedford limestone was begun. Additions to the campus in this period increased its area from 50 to nearly 300 acres. By gifts of the General Education Board and the Rockefeller Foundation, matched by equal amounts appropriated by the State Legislature, the sum of \$4,500,000 became available in 1922 for the extension and reconstruction of the plant of the medical school. With these funds, in the succeeding five years, a new medical laboratory was to be constructed, the floor space of the Children's Hospital doubled, new nurses' homes constructed, and a large general hospital built, making a total hospital clinic of 1200 beds. In 1917, the Iowa Child Welfare Research Station was established for the scientific study of normal children, and in 1921 the School of Commerce was reorganized as the College of Commerce. Thomas H. Macbride, Ph.D., LL.D., retired from the presidency in 1916 and was succeeded by Walter Albert Jessup, Ph.D., LL.D.

IOWA STATE COLLEGE OF AGRICULTURE AND MECHANIC ARTS. A coeducational State institution at Ames, Iowa, established in 1858. The total number in attendance, including short-course students, rose from 3458 in 1914 to 7766 in 1923, and the faculty from 217 to 567; the library expanded from 45,000 to 103,639 volumes. The total value of all college property increased from \$3,000,000 to \$6,500,000, and the annual income from \$349,407 to \$3,250,000 (estimated). The following buildings were erected during the period: four women's dormitories, plant propagation building and greenhouse, science building, hospital, armory, animal husbandry laboratory, agricultural engineering building, poultry laboratory, dairy judging pavilion, and sheep, horse, hog, and dairy barns. A library of 250,000 volumes' capacity, a home economics building, and a dormitory for women were under construction in 1924. President, Raymond Allen Pearson.

IRAQ, or IRAQ. See MESOPOTAMIA.

IRELAND. An island of the British Isles with an area of 32,586 square miles. The population in 1911 was 4,390,219. No census was taken in 1921. By the Government of Ireland

Act (1920), as amended by the Irish Free State Act (1922), Ireland was divided politically into two parts, Northern Ireland and the Irish Free State. The former remains in the United Kingdom; the latter has constitutional status as a dominion. For discussion of matters pertaining to the population, agriculture, industry, commerce, finance, etc., of Ireland as a whole, see GREAT BRITAIN.

History. On the eve of the War, which was destined to affect the fortunes of Ireland no less decisively than those of Europe, three-quarters of the Irish population were solidly backing Redmond's Nationalist party in its agitation for Home Rule, while the rest, defiantly Unionist, were ready to take up arms against the British government, if need be, rather than permit that government to include Protestant Ulster in an autonomous Ireland. For loyal support of Asquith's Liberal cabinet, the 84 Irish Nationalists in the Commons had been rewarded with the introduction, by the Premier himself, of a Government of Ireland Bill (the famous "Home Rule Bill"), Apr. 11, 1912, which had been passed by the Commons twice, twice rejected by the peers, and passed a third time by the Commons in the spring of 1914. Under the terms of the Parliament Act, this bill could now be promulgated by the Crown as law, notwithstanding the Lords' veto, but the Prime Minister, moved doubtless by either the threats or the entreaties of the Unionists, decided with characteristic indecision to compromise on a "middle course." Accordingly, he introduced an Amending Bill, which would permit the Ulster counties, at their option, to exclude themselves provisionally, for six years, from the proposed Irish government. Feeling ran high, in Parliament and above all in Ireland. The Ulster Protestants had taken a solemn oath or "Covenant" to defend at all costs their cherished position of equal citizenship in the United Kingdom; they had set up a provisional government with the firebrand, Sir Edward Carson, at its head; they had organized an army of 100,000 Ulster Volunteers, for which guns and ammunition were smuggled in from Germany and elsewhere. The Nationalists had countered by drilling a force of National Volunteers, for which they also practiced "gun-running." An attempt of British troops to interfere with the gun-running by the Nationalists at Dublin led on July 26, 1914, to the "Bachelors' Walk Massacre" of Irish civilians by a volley from British soldiers. Ireland, obviously, was on the verge of civil war. Then came the international crisis and the War, early in August.

After the English declaration of war on Germany, the Nationalists vied with Ulster Unionists in protestations of loyalty. But when in September, 1914, Premier Asquith decided to put the Home Rule Bill on the statute books, and simultaneously to pass a Suspending Act to suspend it for 12 months, or until the termination of the war, he at once angered Ulster and weakened Redmond's control over the extremists in his party. The organization, known as Sinn Fein ("we ourselves"), led by Arthur Griffith and originally designed to promote a nationalist cultural risorgimento, but now republican in aim, organized a separate body of "Irish Volunteers," captured the Gaelic League, spread its anti-British propaganda through hamlet and heath, and prepared for the day of independence. Sinn Fein, however, was still

but an active minority when in April, 1916, the Easter Rebellion occurred in Dublin. Members of Irish Volunteers and the "Citizen Army" seized the Post Office, the Four-Courts, and other buildings in the heart of the city, and proclaimed Ireland a republic. British machine guns and field artillery soon compelled the republicans to surrender. Swift and heavy was England's vengeance. Some 3400 men and 79 women were arrested as suspects; Padraic Pearse, Thomas Macdonagh, and 13 others were condemned by court-martial and summarily executed; and about 100 were sentenced to imprisonment, while over 1800 were "interned." Sir Roger Casement, who was landed on the Irish coast from a German submarine on the eve of the rising, was tried for high treason and hanged on August 3. The executions, far from settling the matter, aroused such a storm of indignation on both sides of the Irish Sea that Premier Asquith promised to investigate conditions in Ireland personally. A few days' visit convinced him that the government there had completely broken down, and he accordingly delegated Lloyd George to arrange for the immediate application of the Home Rule Act of 1914. But the negotiations begun by Lloyd George met shipwreck when it became known that the government had promised Sir Edward Carson the definite exclusion of the six Ulster counties from the act.

When Lloyd George became Premier of Great Britain in December, 1916, he announced that he could not force home rule on any part of Ireland to which it was repugnant, but in May, 1917, he offered either to grant immediate home rule excluding five Ulster counties for five years or to summon an Irish Convention to propose a solution. As the former alternative was unpopular, he proceeded with the second, although Sinn Fein repudiated it in advance. The Convention was composed partly of elected delegates and partly of Catholic and Protestant clergy, merchants, labor leaders, representatives of Irish parties, and two Irish peers, nominated by the British government; it was to be an inclusive rather than a democratic body. During its protracted deliberations, from July 25, 1917, to April 5, 1918, the economic reasons for Ulster's intransigence figured even more prominently than religious or political factors; and the final report, recommending a united parliament for Ireland, without control of excise and customs taxes, was passed only by 44 to 29 votes, with Ulster and several Nationalists in the opposition. This report was of course disregarded. For its part, the British government in April, 1918, extended the conscription law to Ireland, heedless of warnings. Thereupon the Nationalists, led by John Dillon, successor of John Redmond, who died in March, walked out of the Westminster Parliament and joined Sinn Fein in a protest against the draft. Sinn Fein, by this time, had become a puissant organization; at its convention in October, 1917, representing 12,000 Sinn Fein clubs with 250,000 members, it had voted a republican constitution for Ireland and elected as president Eamonn De Valera, the only surviving leader of the Easter rebellion. De Valera was imprisoned in May, 1918, escaped in February, 1919, and spent the years 1919-21 in America, where he won sympathy and raised funds for the "Irish Republic." In the general election of December, 1918, Sinn Fein won 73 out of the 195

seats in the British House of Commons, while the almost defunct Nationalist party retained only 6, and Unionists filled 26. Considering this victory as a plebiscite for Irish independence, the Sinn Féin M. P.s, instead of proceeding to Westminster, met at Dublin as the "Dail Eireann" (Irish Assembly), adopted a formal Declaration of Independence in January, 1919, and nominated delegates to the Paris Peace Conference. The refusal of the Peace Conference to recognize these delegates, and Wilson's unwillingness to demand their admission, turned Irish and Irish-American sentiment against Wilson, the Peace, and the League, and led disappointed Sinn Féiners in Ireland to resort to violence as their one remaining weapon. With increasing frequency, attacks were made on the Royal Irish Constabulary, the British troops, and British officials, while British troops began wrecking shops and burning villages by way of "reprisal."

Under such disquieting circumstances, Premier Lloyd George persuaded his Parliament to enact, in December, 1920, a new Home Rule Bill, creating separate parliaments and ministries for the six Ulster counties of Northern Ireland and the remainder, inaccurately styled Southern Ireland, with a joint Council of Ireland to harmonize the two. Neither parliament was to have power to control customs and excise duties, army and navy, treaties, titles, external trade, cables, coinage, trademarks, or religion. Ulster accepted the law forthwith, elected its parliament in May, 1921, organized its cabinet under Sir James Craig, and was congratulated by King George in person. Southern Ireland likewise held elections in May, but the Sinn Féiners elected by all constituencies except Dublin University were pledged not to accept mere home rule. Encouraged, Sinn Féin intensified the irregular warfare it had been waging against the British and especially against the "black-and-tans," ex-service men enrolled as auxiliary police and clad in khaki with black hats and black armbands. The shooting of British soldiers and constables and seizures of arms by Sinn Féin troops increased, and the burning and pillaging of Irish towns and villages by the British grew more frequent. Sinn Féin courts and police were organized, and "Castle" government, the British government, ceased to have any real functions of administration.

At length Premier Lloyd George in desperation invited the Sinn Féiners, hitherto regarded as "rebels," to negotiate with him. Through the mediation of General Smuts, a "truce" was signed, July 10, 1921. England's offer of "Dominion status," at first rejected by De Valera and the Dail Eireann, was ultimately accepted in principle as the basis for a tripartite conference of Sinn Féin, Ulster, and British delegates, October to December, and incorporated in a definite treaty dated Dec. 6, 1921. Article 1 conferred on the Irish Free State the same constitutional status as that of Canada and other dominions. Ireland was to have its own parliament and an executive responsible to it (Article 1), its own army (Article 8), and, in short, the almost complete independence of a dominion (see *BARRISH EMPIRE*), but with a strict proviso against religious discrimination (Article 16) and transitional fiscal and naval restrictions (Article 5-6 and 10). Ulster was permitted either to accept inclusion in the Free

State, with local autonomy, or to continue as a part of Great Britain with the Northern Ireland Parliament retaining the rights granted by the Home Rule Act of 1920. Naturally Ulster chose the second alternative, and the government of Northern Ireland remained precisely as established in 1921. The provisions of the 1920 Act regarding a joint Council for Ireland also remained in force, as a result of Ulster's choice (Article 12).

This treaty, liberal as it was, compared with earlier British offers, failed to placate President De Valera and other Sinn Féin irreconcilables, who still cherished the ideal of a united independent republic, and bitterly assailed Article 4 of the treaty, requiring members of the Free State Parliament to swear allegiance to King George. On the other hand, Arthur Griffith, Michael Collins, and other Sinn Féin leaders who had signed the treaty believed it to be as much as could practically be obtained, and persuaded the Dail Eireann to accept it by 64 to 57 votes. De Valera indignantly resigned from the presidency, to which Griffith naturally fell heir, in January, 1922, and the southern Irish parliament formally ratified the treaty. As Great Britain had also ratified, the Free State came into being on January 16; its provisional government, with Michael Collins as premier, took over Dublin Castle from the British administration and joyfully watched 60,000 British soldiers depart from Ireland. Soon, however, De Valera's uncompromising republican adherents took up arms against the Provisional government, and Ireland was once more in the throes of guerilla warfare. The death of President Griffith on August 12 and the killing of Premier Collins on August 22 by republicans might well have discouraged the Free State forces, but the latter event seemed to have the contrary effect of arousing indignation against the republicans. William T. Cosgrave succeeded Collins as head of the government. Meanwhile, a provisional parliament favorable to the treaty had been elected in June, and in the autumn this body adopted a constitution on October 11, making Gaelic the official language of the Free State, guaranteeing personal and religious liberty, and creating a bicameral Free State parliament (*Oireachtas*) with an Executive Council or cabinet of ministers responsible to the lower house. The House of Representatives (*Dail Eireann*) of 153 members was to be elected, for four years, unless dissolved, by universal suffrage of men and women over 21, with proportional representation. The Senate (*Seanad Eireann*) of 60 members was to be chosen, one-fourth every three years, by a vote of citizens aged 30 and over, with proportional representation, from a list of prominent citizens nominated by the Irish Parliament. The constitution was confirmed by the British Parliament early in December, 1922, and the new government was at once established: the provisional parliament now became the first House of Representatives, and the first Senate was chosen, half by the House and half by the president of the Executive Council. Cosgrave became president of the Executive Council, and Timothy Healy was appointed by the Crown as Governor-general, an almost purely honorary post.

The republicans, meanwhile, had proclaimed a rival government, and though obviously in a minority, refused to abandon their irregular

warfare against the Free State until thousands had been killed or wounded, 15,000 republicans imprisoned, and scores executed in reprisal for republican deeds of violence. In April, 1923, De Valera ordered a truce, in view of approaching elections; he was, however, arrested on August 14, to be, however, released in the July following. Though large numbers of republicans were released in course of time, several thousand were held in jail regardless of hunger strikes. By 1924 the country was fairly well pacified, and the Free State government was functioning in an orderly fashion. Elections for the House held on Aug. 27, 1923, had given the Cosgrave government 63 seats; Republicans, 44; Labor, 15; Farmers, 15; Independents, 16. As the 44 republicans absented themselves when the new Parliament met in September the government had a working majority and addressed itself earnestly to the difficult tasks of extending peasant proprietorship and balancing an unbalanced budget. With the Northern government, the Free State made a futile effort in February, 1924, to agree on the disputed Ulster boundary. On Sept. 10, 1923, the Irish Free State was admitted to the League of Nations, and the once despised Gaelic tongue was heard as a national language in the assembly of nations at Geneva.

IRELAND, JOHN (1879-). An English composer, born at Inglewood, Bowdon, Cheshire. He was a pupil in composition of Stanford at the Royal College of Music. From 1901 to 1909 he wrote several choral works with orchestra, orchestral works in the larger forms, and much chamber music, all of which he later discarded. His principal works, published after 1909, include a prelude for orchestra, *The Forgotten Rite*, two piano trios, two violin-sonatas, pieces for piano, and songs.

IRELAND, NORTHERN. The official name of that part of Ireland remaining in the United Kingdom of Great Britain and Ireland. It is made up of the following counties and county boroughs: Antrim, Armagh, Belfast (County borough), Down, Fermanagh, Londonderry, Londonderry (County borough), Tyrone. Its area is 3,351,446 statute acres (5,237 square miles), its population in 1926, 1,256,322. See **GREAT BRITAIN. IRELAND.**

IRISH FREE STATE. A dominion of the British Empire, with an area of 17,019,155 statute acres (26,592 square miles) and a population according to the census of 1926 of 2,972,802 a decline from 3,139,688 in 1911 due to emigration. See **GREAT BRITAIN; IRELAND.**

IRON AND STEEL. During the decade of 1914-24, the iron and steel industry of the world furnished a notable illustration of the intimate relation of the development of natural resources and modern industrial activity to the maintenance of conditions of civilization even under the extensive dislocations effected by the War and the inevitable readjustment following it. Of course it was obvious that iron and steel manufactures were essential to twentieth century civilization and that they ranked high in commerce, but if any further proof was needed it was found in the demands made on these industries in the great struggle. The warring powers were compelled to mobilize their iron and steel industries and operate them on a war basis, and the possession of raw materials for these industries was naturally an important military asset. Accordingly, when the

Central Powers were defeated and Germany was deprived of a large portion of her mineral lands, it was indeed a serious blow, and the return to France of Alsace-Lorraine carried with it mines whose acquisition in part compensated for the ruthless destruction of mines and steel plants by the Germans during their invasion.

During the War, in all of the combatant nations the production of munitions and ship-building materials was pushed to the uttermost, and there was considerable coöperation on the part of the Allies. After the Armistice, France secured the return of the valuable iron basin in Lorraine, and with it a certain amount of manufacturing facilities became available immediately. In the Briey region, while the Germans had ruined the open hearth furnaces, they had left the blast furnaces intact, so that having acquired the ore deposits in the Longwy-Briey-Nancy fields of Alsace-Lorraine, France was put in a position to double her production of iron ore, and Germany suffered correspondingly. It was stated that before the War, Germany, exclusive of Luxemburg, had derived 74 per cent of her iron ore from the annexed portion of Lorraine, or upward of 21,000,000 tons annually. As this ore had an iron content of about 33 per cent, there was roughly an annual loss of 7,000,000 tons of pig iron and a reduction of Germany's annual steel output of from 6,000,000 to 7,000,000 tons. The result of these changed conditions was appreciated immediately in Germany, for with the scarcity of coal and iron ore inevitable to the readjustment there was a heavy demand for iron and steel products of which importations from Sweden, on a reduced scale, and a smaller amount received from France, were unable to take care.

The industry in Germany was in some ways on a more promising basis than in Belgium and France, where there had been systematic and complete destruction by the Germans at many manufacturing centres. Accordingly, in 1919, both Belgium and France were endeavoring to readjust themselves to the new conditions and to put their plants in order by repairs or rebuilding, with new equipment to take care of the business destined to come their way. In Great Britain, on the other hand, during 1919 there was a considerable demand for iron and steel products in excess of the supply, and high prices and large profits prevailed, though there was a marked decline in the exports of pig iron as well as of iron and steel. The supply was inadequate for the demands on account of lack of coal, ore, and cars and because of a shortened working day, together with the railway strike, all of which served to cut down the output, although the productive capacity certainly existed. The state subsidy on pig iron and government control of prices which had been imposed during the War was terminated on Apr. 30, 1919. There developed during this and the succeeding year a boom in the British iron and steel industry which reached a high-water mark in the early autumn of 1921 and recalled a similar condition following the War of 1870, after which there was a recession of prices. In 1920 the Belgian steel industry was being put in fairly efficient condition. The same was true in even greater measure for France, while in Germany there was marked activity for the iron and steel plants, most of which considered the year one of prosperity, notwithstanding

many adverse conditions. At this time were organized several big trusts by which it was hoped to establish economies of operation to compensate for the loss of the large efficient plants in Lorraine and Luxemburg, along with the ore fields. Germany was compelled to import ore and was active with export business. New steel works were under construction, and efforts were made at various metallurgical developments which in part came in connection with the War. The German export business continued into 1921, and the profits of the industry increased rather than diminished, though the finances of the country and the political situation did not make for the maximum of effort.

In Great Britain during 1921 an acute depression prevailed which was compared to that of 1879, said to be the most disastrous period that British iron and steel interests had ever faced. Prices collapsed, and foreign customers were unable to take their normal proportion of British exports, while both foreign and home markets were being invaded by France, Belgium, and Germany. Exports sold more cheaply than British manufacturers could turn out the product. By 1922, however, there was a general improvement in conditions, and while the pig iron production of the world was only about 67.7 per cent of what it was in 1913, yet the steel production was very close to that of the earlier year, and the five great producing nations of the world were increasing their exports, although those of the United States were less than in 1912 and 1913. The production capacity of Germany had been reduced approximately 40 per cent by the War, and in 1922 it had fallen to about 75 per cent. In France, on the other hand, there was in 1922 a greater output of pig iron than in any year since the War; it amounted to an estimated total of 4,873,000 gross tons, as compared with 4,620,000 in 1913; but even at this time a number of the French steel mills had not been entirely restored. Belgium, as will appear from the accompanying table, was increasing its production as well as its exports, and its iron and steel industries were becoming well organized; in the following year it was able to export more steel than any other nation except Great Britain, while its increase of production of both pig iron and steel was remarkable. In 1923 Belgium was using coal and coke imported from Great Britain in place of coal and coke from the Ruhr, and Great Britain also supplied large quantities of iron ore and pig iron which were handled in Belgian plants.

The end of the year 1922 marked a turning point in the German iron and steel trade, for

with the occupation of the Ruhr by the French on Jan. 11, 1923, the industry in that region practically ceased, and financial and economic conditions were such as to prevent either domestic or export business on any considerable scale. Previously there had been considerable promise for German iron and steel, but in 1923 political and industrial conditions were such that only a limited output could be made. In France the total production of iron and steel in 1922 and 1923 exceeded the pre-war output, but it must be recalled that the Peace Treaty gave France important German steel producing districts. France was able to have an increased coke supply, both from the North and from abroad, as well as from the Ruhr, and in 1923 there was little unemployment and but few strikes. The French occupation of the Ruhr was an advantage to the British iron and steel industry as it cut down to a large degree the German output, and handicapped, at least in the early part of the year, the production of both France and Belgium. The iron and steel industry of Great Britain was able to show a considerable improvement in 1923 (see accompanying table).

BRITISH IRON AND STEEL OUTPUT AND EXPORTS DURING PEACE YEARS

United States Iron and Steel Industry. In the United States the iron and steel industry so improved its organization in the decade 1913-23 that it was able not only to meet the demands of the War but also to adjust itself to the conditions incident to deflation and the increased calls on it by various industries. This industry involved ore mining, the production of pig iron and steel ingots, the finishing of the crude metal into various products and

In 1923 there were 147 works in 24 States and the District of Columbia which made alloy-steel ingots or castings.

their transportation and marketing; all of these operations were in some instances carried on by a single corporation. In the ordinary and commercial census classifications, the iron and steel industry embraces three primary classes of manufactured products: unfinished iron and steel, i.e. pig iron and steel ingots and castings; semi-finished iron and steel, i.e. billets, blooms, slabs, sheet, bars, tin, brass, and skelp; and finished iron and steel, i.e. bars, plates, sheets, tin plate, structural shapes, fabricated and unfabricated, rails and rail connections and accessories, cast iron pipe, welded and drawn pipe and tubing, iron and iron products, including nails and forgings, and castings. These products, when fabricated, are considered as machinery, construction material, farm implements, etc.

The period 1914–24 opened with a depression in the American iron and steel industry which was quite marked in 1914, but with the outbreak of the War came improvement, and in 1915 domestic business increased, and foreign markets required supplies which Europe was

naturally unable to provide. Accordingly, production was on an extensive scale until 1917, when the United States entered the War, and it was realized that every effort must be made to provide munitions and ships essential to the American military and naval forces and necessary aid to the Allies. By 1918 American iron and steel products were mobilized for maximum production and cooperated with the government in the manufacture of munitions. In fact, the available capacity had been increased nearly 40 per cent, and at the same time the business had been conducted on a basis of fixed prices determined by official action. All of these sufficed admirably for the time of the War, but after the Armistice the steel producers realized that with their increased facilities a reduced volume of business was bound to come, so that the inevitable readjustments were involving many serious difficulties.

An attempt was made to have prices fixed on an equitable basis, though somewhat reduced from the War rates, and such prices held during 1919, although many independent manufacturers availed themselves of the great demand for iron and steel products and secured amounts considerably in excess. In 1919 also the United States steel industry faced a strike which began in September, 1922, involving 268,710 employees scattered throughout the United States, principally in the plants of the United States Steel Corporation. In this struggle were involved the questions of collective bargaining, wages, hours, conditions of labor, and sundry principles advanced by organized labor. Some damage was done and rioting took place throughout Pennsylvania before the strike gradually subsided, but at the end of the year, although it was not actually ended, the mills were in operation and the trouble overcome for the most part. In 1923 the annual pig iron capacity of the United States was more than 52,000,000 tons, and the various furnaces produced steel ingots and castings to 58,500,000 tons. The manufacture of pig iron in 1922 involved the consumption of about 54,000,000 tons of ore, 32,000,000 tons of coal and coke, 24,000,000 bushels of charcoal, and 13,500,000 tons of lime-

Structural shapes	1,448	3,403,749	3,405,197
Merchant bars	404,730	5,148,066	5,552,796
Bars of reinforced concrete work	368	680,499	680,867
Skeip, flue, and pipe iron or steel	216,846	3,517,490	3,734,336
Hoops		220,835	220,835
Bands and cotton-ties	2,813	345,667	348,480
Long angle splice bars, tie-plate bars, etc.	40,495	709,329	749,824
Rolled sheet piling, not including fabricated		36,716	36,716
Railroad ties		20,167	20,167
Rolled forging blooms, forging billets, etc.	3,181	445,689	448,870
Blooms, billets, sheet bars, etc., for export		781	781
All other finished hot-rolled products, including hot-rolled strips and flats for cold rolling	278,816	2,298,433	2,577,249
Total, Gross tons	955,597	32,321,479	33,277,076

stone, so that the production and transportation of these items is very important and must grow in a normal and efficient way, free from such disturbances as strikes and railway restrictions, in order for the industry to function properly.

panying table shows the estimated quantity and value of the iron ore mined and shipped in the United States by the principal producing States in 1923.

ESTIMATED CONSUMPTION OF STEEL BY INDUSTRIES IN THE UNITED STATES, 1923

[Estimates by Iron Age, New York]			
	Per cent of total	Tons	
Automobile industry including trucks, tractors, etc.	11	3,470,000	
Railroads including cars and locomotives	27	8,590,000	
Agriculture	4	1,200,000	
Buildings (including bridges and other construction not R. R.)	15½	4,865,000	
Shipbuilding	1	310,000	
Containers (principally food)	3½	1,100,000	
Machinery (electrical, textile, machine tools, etc.)	3	940,000	
Oil, gas, water and mining	10½	3,330,000	
Exports	6	1,945,000	
Miscellaneous	18½	5,830,000	
Total		31,580,000	

Iron Ore Produced in 1923. In 1923 the iron ore mined in the United States, exclusive of ore containing more than 5.5 per cent of manganese, was estimated by the United States Geological Survey at 70,018,000 gross tons, an increase of 49 per cent as compared with that mined in 1922. The ore shipped from the mines in 1923 was estimated at 70,433,000 gross tons, valued at \$244,749,000, an increase of 39 per cent in quantity and 55 per cent in value as compared with the figures for 1922. The average value of the ore per gross ton at the mines in 1923 was estimated at \$3.47; in 1922 it was \$3.12. The production for 1923 appears to be the third highest in the history of iron mining; it was exceeded only by 75,288,851 tons in 1917 and 75,167,672 tons in 1916. The accom-

ESTIMATES OF IRON ORE MINED AND SHIPPED IN THE UNITED STATES IN 1923

District	Ore shipped Gross tons	Value
LAKE SUPERIOR		
Michigan	14,219,000	\$55,128,000
Minnesota	44,611,000	161,995,000
Wisconsin	1,179,000	3,587,000
	60,009,000	\$220,710,000
SOUTHEASTERN STATES		
Alabama	6,968,000	\$14,451,000
Georgia	133,000	310,000

Virginia	202,000	694,000
	7,716,000	\$16,778,000
NORTHEASTERN STATES		
Massachusetts		
New Jersey	350,000	\$1,435,000
New York	708,000	3,131,000
Pennsylvania	971,000	1,159,000
	2,029,000	\$5,725,000
WESTERN STATES	679,000	1,536,000
Grand total	70,433,000	\$244,749,000

About 85 per cent of the iron ore shipped in 1923 came from the Lake Superior district, in which 59,976,000 gross tons were mined and 60,009,000 tons shipped. The ore shipped in 1923 was valued at \$220,710,000. These totals include the ore from the Mayville and Baraboo mines in Wisconsin and ore shipped by rail as well as by water from all mines, but exclude manganese ores containing more than 5.5 per cent manganese. The ore is chiefly hema-

tite. The average value of the ore at the mines in the Lake Superior district in 1923 per gross ton was \$3.68; in 1922, \$3.33. The mines in Minnesota furnished 74 per cent of the total iron ore shipped from the Lake Superior district in 1923 and 63 per cent of the total of the United States. The mines in Michigan fur-

are then rehandled by the rolling mills, forges and presses by which various products, such as rails, sheets, pipe, etc., are derived. In fact the extent and variety of the iron and steel industry, as listed above, is reported in the Census of Manufactures for 1921 in the accompanying table.

IRON AND STEEL INDUSTRY, 1921*

Classes	Estab-lish-ments	Wage earners	Cost of material	Value added by manu-facture	Value of products
Iron and steel blast furnaces	134	18,698	\$361,049,521	\$58,721,723	\$419,771,244
Steel works and rolling mills, including tin plate	498	235,967	1,010,290,351	477,787,027	1,488,077,378
Cast-iron pipe	70	12,496	23,897,020	20,424,528	44,321,548
Steam fittings and steam and hot-water heating apparatus	274	30,808	50,212,922	77,153,965	127,366,887
Wrought pipe	57	8,728	37,093,041	19,569,237	56,662,278
Wire and wirework (not included in wire depart-ments of rolling mills)	474	26,317	99,744,248	66,555,873	166,330,121
Forgings, including springs and horseshoes	378	22,305	61,298,673	55,534,638	116,833,311
Nails and spikes, wire, cut and wrought	56	2,412	5,670,025	5,306,282	10,976,307
Tanks, barrels, doors, and shutters	76	3,795	13,556,018	18,435,693	26,991,711
Structural ironwork	1,021	32,897	151,011,215	99,074,231	250,085,446
Bolts, nuts, screws, washers, and rivets	293	18,801	28,586,981	32,970,204	61,557,185
Total	3,381	413,224	1,842,410,015	926,563,401	2,768,973,416

* Includes only those industries listed in the three primary classes of manufactured products mentioned above.

nished 24 per cent of the Lake shipments and 20 per cent of the grand total. The southeastern States, which constitute the second largest iron ore producing area, including the Birmingham and Chattanooga districts, mined 7,533,000 gross tons in 1923. The shipments of ore from these States to blast furnaces in 1923 amounted to 7,716,000 gross tons, valued at \$16,778,000. The ore consists mainly of hematite, with brown ore and magnetite next in order. The average value of the ore produced in these States in 1923 per gross ton was \$2.17; in 1922, \$1.74. The northeastern States, which include the Adirondack district, New York, and the Cornwall district of Pennsylvania, in 1923 mined 1,823,000 gross tons of iron ore and shipped 2,029,000 gross tons. The average value of the ore in these States in 1923 per gross ton was \$2.82; in 1922, \$2.33. Most of this ore is magnetite. The western States which ordinarily produced iron ore, named in the order of their importance, are Wyoming, New Mexico, Utah, Montana, California, and Colorado; occasionally Idaho and Nevada contribute small quantities. The ore from Wyoming, New Mexico, and Colorado is used for the manufacture of iron at Pueblo, Colo., but much of the remainder of the output is used as a flux in smelting copper and the precious metals. It is estimated that the western States mined 677,000 gross tons of iron ore and shipped 679,000 gross tons, valued at \$1,536,000, in 1923. The ore comprises hematite, magnetite, and brown ore.

As is generally known, the ore after being mined is transported to blast furnaces where it is made into pig iron. The 1923 production of pig iron, excluding charcoal iron and including blast-furnace ferro-alloys, according to the *Iron Trade Review*, was 40,019,129 gross tons. This was the largest annual output yet made, exceeding the high record of 1916 by 1,000,000 tons. A part of the pig iron is utilized in the production of rolled and wrought iron products, and for the manufacture of castings in iron foundries. The greater part, however, is utilized in the making of steel by the open hearth Bessemer electric and crucible processes which produce ingots, blooms, billets, bars and slabs which

Naturally these industries do not embrace all of the various shipments of the industry of iron and steel and their products. Those in the table are estimated as one-fifth of the total number of shipments. The aggregate employed a daily average of 1,030,248 persons, and the value of their product was \$5,592,204,380. In the United States the greatest amount of business was handled by the United States Steel Corporation, but during the decade under consideration other consolidations were formed in the interest of greater efficiency and economy, and still further consolidations would doubtless have been effected except for the opposition of the Attorney General and the Federal Trade Commission. Nevertheless the Bethlehem Steel Corporation acquired in May, 1922, the Lackawanna Steel Company; in November the Midvale Steel and Ordnance Company was also purchased, with the result that the enlarged Bethlehem Company was given an annual capacity of 7,500,000 tons of steel ingots. Another important consolidation was that of the Youngstown Sheet and Tube Company with the Brier Hill Steel Company, a combination which later absorbed the Steel and Tube Company of America.

United States Imports and Exports. The imports of iron ore for 1923 amounted to 2,768,430 gross tons, valued at \$11,308,503, or \$4.08 a ton. The imports for the year 1922 were 1,135,156 gross tons, valued at \$4,916,294, or \$4.33 a ton. The exports of iron ore for 1923 amounted to 1,116,932 gross tons, valued at \$5,305,365, or \$4.75 a ton, as compared with exports for the year 1922 of 602,194 gross tons, valued at \$2,770,878, or \$4.60 a ton. The foreign trade of the United States is often quite uneven, as American manufacturers of iron and steel seek to satisfy domestic demands, and when there are large calls for iron and steel at home, the export trade suffers. The accompanying table indicates the exports of iron and steel for significant years during the period under review. Likewise, the major iron and steel imports are also indicated in a table, though this business naturally depends on special conditions, as may be seen by the difference of imports in the years 1921 and 1922.

* Figures for 1913 are for the fiscal year; for 1921 and 1922, calendar years. From the 1922 statistics such commodities as wire rope, castings and forgings, strip steel, tubular products, nails, screws, bolts, nuts, etc., have been omitted in order to make the basis of comparison with the earlier years as uniform as possible.

Electric Steel. The American electric steel industry from 1913 to 1923 increased more than twenty-fivefold. In 1913 electric steel castings constituted less than 1 per cent of the total output. In 1923, 235,958 gross tons of steel castings came from electric furnaces; this was 53 per cent above the best previous record, that of 1920. The alloy steel castings made in electric furnaces in 1923 amounted to 29,054 tons, against 17,760 tons in 1922. This increase of 64 per cent emphasized the tendency of heat-treated steel alloy castings to replace forgings. In 1923 the electric steel ingot production was 279,914 tons, or 0.64 per cent of all steel ingots, in comparison with 0.93 per cent in 1918. Taking the electric steel industry as a whole, the 1923 production of ingots and castings amounted to 515,872 tons, as compared with the wartime production of 511,364 tons in 1918.

Working Conditions. The long hours which had prevailed in the iron and steel industry for certain classes of labor for some time had been

the object of considerable criticism from social workers and others. They were defended by the management of the steel works as essential to the economical conduct of the industry. Therefore it was a somewhat radical step which was proposed in 1923 when there was abolished the 12-hour day for certain classes of labor at plants producing about 80 per cent of the total amount of steel of the United States. This was so successful and so general that at the end of the year 1923 there were but few companies that had not adopted the change. On May 18, 1922, President Harding had called a conference at the White House to discuss the abolition of the 12 hour day, in which some 46 members of the American Iron and Steel Institute participated. As a result, on May 26, 1922, Judge Elbert H. Gary, president of the Institute, appointed a committee of nine to make a "careful and scientific investigation and to report to the steel industry conclusions and recommendations regarding the 12 hour day." This committee took the subject under discussion, and on May 25, 1923, the American Iron and Steel Institute Committee reported that "if labor should become sufficient to permit, the members of this committee would favor entirely abolishing the 12 hour day, providing the purchasing public would be satisfied with selling prices that justified it." President Harding's interest in the matter was unflagging; on June 18, 1923, he wrote Judge Gary, earnestly urging the abolition of the two-shift system. On June 27, the directors of the American Iron and Steel Institute assured President Harding that the 12 hour shift would be abolished at the earliest moment practicable, and the first positive step was taken towards complete abolition on Aug. 16, 1923, when the Carnegie Steel Company inaugurated the establishment of an 8 hour day, and other companies rapidly followed. By the end of the year all of the employees of the United States Steel Corporation and about 70 per cent of the independent plants in the Pittsburgh district were working less than 12 hours, while in the Chicago district the long day had almost entirely disappeared. It was estimated that the new work day added from \$2 to \$3 a ton to the cost of a ton of steel, this extra expense being mainly in the steel works and rolling mills, as at the blast furnaces in many cases the cost of the change was surprisingly small. Both operators and employers believed that the shorter day was working out successfully, and the many adjustments required were made with care and skill. The year, however, was favorable for making the change, as most of the plants were working reasonably full; and while there was a shortage of labor, it was not a preponderating condition in the industry.

IRRIGATION. See DAMS; and RECLAMATION.

IRWIN, WALLACE (1876-). An American humorous writer, born at Oneida, N. Y., brother of William Henry Irwin (Will Irwin). He studied at Leland Stanford Junior University, 1896-99, and became editor of the *Overland Monthly Magazine* in 1902. As a writer of burlesques and topical verse he drew wide attention, especially by *The Love Sonnets of a Hoodlum* (1902). Other successes soon followed, including *Nautical Tales of a Landsman* and *At the Sign of the Dollar* (1904) and *Chinatown Ballads* (1905); but the most widely cited of his writings was the humorous series

of papers dealing with an imaginary Japanese youth called Togo and collected as *Letters of a Japanese Schoolboy* (1909) and *Mr. Togo, Maid of All Work* (1913). Among his later books may be mentioned: *Pilgrims into Folly* (1917); *Venus in the East* (1918); *The Blooming Angel* (1919); *Suffering Husband* (1920); *Seed of the Sun* (1921); and *More Letters of a Japanese Schoolboy* (1923).

IRWIN, WILLIAM HENRY (WILL IRWIN) (1873-). An author and war correspondent, born at Oneida, N. Y., brother of Wallace Irwin. He graduated at Leland Stanford Junior University in 1899 and was on the staff of the *San Francisco Chronicle* in 1901-04, and of the *New York Sun*, 1904-06, and managing editor of *McClure's Magazine*, 1906-07. After 1908 he was mainly engaged in writing for the magazines. During the War he was with the Allied armies as correspondent for the various American periodicals, 1914-15, and for the *Saturday Evening Post*, 1916-18. Among his books may be mentioned: *The Hamadryads* (verse, 1904); *The City That Was* (1907); *Old Chinatown* (1908); *Confessions of a Con Man* (1909); *Warrior the Untamed* (1909); *The House of Mystery* (1910); *The Readjustment* (1910); *The Red Button* (1912); *Where the Heart Is* (1912); *Men, Women and War* (1915); *Latins at War* (1916); *The Thirteenth Chair*, a play, with Bayard Veiller (1916); *A Reporter at Armageddon* (1918); *The Next War* (1921); *Columbine Time* (1921); and *Christ or Mars?* (1923).

ITALIAN LITERATURE. If the first 15 years of the twentieth century in Italian literature were distinguished by the development of Crocean thought, we may say that the years 1914 to 1924 were dominated by Benedetto Croce and by the men, such as Giovanni Gentile, who either continued and perfected his philosophy or reacted against it. Croce's most novel and influential ideas were in the field of aesthetics, which, furthermore, he approached from the angle of literary criticism. By the close of the decade the *Philosophy of the Spirit* had had the effect of making virtually all educated Italians under 45 years of age amateur philosophers and professional literary critics. At any rate, the balance of literary production had been shifted in the later years in the direction of "thought" and away from what might be called "creation."

The typical Italian experience had been that of Giovanni Papini as portrayed in his autobiographical confessions, *Un Uomo finito* (The Failure). This is a record of a strenuous philosophical life. The problem of the young man is to find his place in the universe, acquire a satisfactory solution of the questions that life puts to him. The mood is one of passionate research, with ups and downs of exalted hope and anguished disillusionment. What distinguishes the European mind in general and the Italian in particular from a common American outlook

on life is the sense of individual impotence before the weight of tradition, the feeling of being caught in an unescapable fixity. The young Italians had made and were making a frontal attack on this situation. The yearning for freedom, in Papini among others, takes on violent and almost incoherent forms; and it furnishes the motive for much of that thinking of a neo-idealistic character which, inspired by Croce and perfected by Gentile, is fashionably known as "activism."

This is one characteristic that tends to separate the young from the old, the new from the old, in Italian literature; a gap, or rather a rift more or less perceptible, of which the War is made to serve as an unsatisfactory marker. The men who came forward in the decade proclaimed their denial of the "three crowns" of the generation preceding of Carducci, of Pascoli, of D'Annunzio—we may even add Fogazzaro. It is a denial, one must understand not so much of these masters themselves, as of their followers and imitators, and of the influence, tending to express itself in precept, which they exert on the future.

The spirit of revolt is variously formulated. The young poets (conveniently presented in Olindo Gibboni's anthology *Le più belle pagine dei poeti d'oggi*—The Poets of Today) raise the standard of "pure art"—an art that is pure impression, pure image, pure "intuition" (to use a Crocean phrase), as distinguished from the art of Carducci, which is thought of as "parasitically exploiting" various practical emotions engendered by the liberal and national Risorgimento. Carducci, in fact, expresses in poetical form an ideal of Italian citizenship; and he glorifies the Italian past to sustain that ideal of citizenship. How much of his fame does the poet owe, therefore, to his morality and how much to his poetry? The indictment of Carducci was drawn, curiously enough, by a critic who had stood aloof from the Crocean tradition and had even been scorned by the young men for his fogginess: by Enrico Thovez, a Piedmontese writer, author of *Mimi dei moderni* (Mimes of the Moderns), *Il pastore, il gregge e la zampogna* (The Shepherd, the Flock, and the Reed), *Il viandante e la sua orma* (The Trail of the Wayfarer), *L'arco d'Ulisse* (The Bow and Quiver of Ulysses), and various volumes of verse. The poets who may be taken as objectifying this reaction are, among others, Sergio Corazzini (1887-1907), author of *Liriche* (Lyrics); Ettore Cozzani, author of *Orazione ai giovani* (An Address to Youth), *La siepe di emeraldo* (The Emerald Hedge), *Le sette lampade accese* (The Seven Lighted Lamps), and other things; Aldo Palazzeschi, author of *I cavalli bianchi* (The White Horses), *Lanterna* (The Lantern), *L'incendiario* (The Incendiary), and a famous whimsical romance, *Il codice di Perelà* (The Code of Perelà); Corrado Govoni, author of 11 volumes of verse, and in the later years of novels and short stories; Luciano Folgore, a futurist, and Guido Gozzano (1883-1916), who, with Corazzini, was regarded as among the greatest of these. No review of Italian poetry could, of course, omit Filippo Tomaso Marinetti, author of *Mazurka*, of a play, *Il tamburo di fuoco* (The Fiery Drum), and various manifestos of Italian futurism of which he was founder and publicity agent.

In prose writing "activism" expressed itself

as a kind of anti-D'Annunzianism—a preference for “substance” as against “rhetoric,” for “things” as against “words,” D'Annunzio being taken as a symbol for “rhetoric” and “words.” A keen Neapolitan critic (in 1924 living in Rome), Adriano Tilgher, had pointed out that D'Annunzio's sensual dilettantism, with its passionate affirmation of the autonomy of the individual spirit, is really closer to the new moods of the Crocean era than had been supposed. In fact, D'Annunzio is the man who connects this later period with its roots in the old romanticism. However, both the kind of life that D'Annunzio seemed to exemplify, and his florid, splendidous, gold-dripping sentence no longer pleased. The young men set up the plain, solid, meaty novels of Giovanni Verga (1840–1922, author of the cycle called *I vinti* (The Vanquished) as a better expression of the Italian literary ideal; just as they leaped over Fogazzaro to go back to Manzoni, to find a congenial expression of a religious ideal. As significant of the changing trend as these “revivals,” are one or two rehabilitations of living men. of Alfredo Panzini (born 1863) who reached maturity in the Carduccian spirit, but won the favor of the young men (his best novel, *Il padrone sono me!*—“The boss? That's me!”); and of Luigi Pirandello, whose *Il fu Mattia Pascal* (Late Mattia Pascal) sold to 2000 copies in 20 years, and to 100,000 in the last five years of the period 1914–24.

Not that the young men produced much that is truly exceptional in the field of the novel. The closest approach to an artistic sensation in the 10 years was the *Filippo Rubé* (Rubé) of the critic-scholar-poet-journalist, G. A. Borgese, who reviewed the pre-Fascisti period of Italian reconstruction in the manner of Stendhal and with something of the sweep of imagination with which Stendhal, a century before, reviewed post-Napoleonic reconstruction. But the promise of *Rubé* was hardly kept in Borgese's subsequent *I vivi e i morti* (Living and Dead). So a temporary excitement welcomed Gino Rocca's *L'Uragano* (Hurricane). Much was expected from Rosso di San Secondo after the collection of tales called *Ponentino* (West Wind); but apart from a certain lubricious perversity in *Le donne senza amore* (Women without Love) and some pretty pages in *La Fuga* (Flight), his novels had proved in no sense as interesting as his plays (see below). Some faithful workers and accomplished technicians came forward in the latter years. Marino Moretti, in, for example, *La voce di dio* (The Voice of God), and *I puri di cuore* (The Pure of Heart); Mario Puccini, in *Dov'è il peccato è dio* (The Miracle); Salvatore Gotta, in *Il figlio inquieto* (The Restless Child); Corrado Govoni, more famous as a poet, in *La terra contro il cielo* (Earth Against Heaven); and Virgilio Brocchi, in *Il posto nel mondo* (His Place in the World). For the rest, the public that reads for amusement continued to depend upon older writers of established reputation who had not indulged to any great extent in poses of novelty: Luciano Zuccoli, in two of his best things, *L'Amore di Loredana* (The Love Affair of Loredana), and *Le cose più grandi di lui* (Things Bigger Than He); Grazia Deledda, in *Il dio dei viventi* (The God of the Living)—Deledda enjoying a real eminence in her declining years; Antonio Beltramelli, whose patient studies among the customs of Romagna gained a certain actuality

from the triumph of Mussolini, a Romagnolo—see *Gli uomini rossi* (The Reds and the Blacks; Annie Vivanti, a woman of international culture—having lived in New York and Wyoming, as well as in Ireland, England and Germany—who continued her gaiety and humor in *Zingaresca*, and in *Gioia* (Joy). Guido da Verona, in spite of everything, has to be regarded (see *La vita comincia Domani* (Life Begins To-morrow) as one of the masters of the European novel of large canvas and close worked detail, who, as Tilgher again has said, has expressed certain European states of mind in enduring form and even created moods of life which hosts of people have imitated. Da Verona's vogue was waning, and perhaps his power too; though *La mia vita in un raggio di sole* (My Life in a Ray of Sunshine) is worth reading.

The real discovery of the 10 years in the field of the novel was Federico Tozzi (1890–1920) whose premature death did not prevent the revelation of a great genius in the style of Dostoevski in *Tre Croci* (Three Crosses), *Il podere* (The Farm), *Ad occhi chiusi* (With Eyes Closed), and *Amore* (Love).

In the world of the theatre the “old” and the “new” came into self-conscious conflict, with new authors, new styles, and a new criticism combating old authors, old styles, old conceptions of the drama. The critic who emerged in this connection is Adriano Tilgher (*Studies on the Contemporary Drama*, trans., Dutton, New York), whose works are fundamental for a knowledge of the new tendencies (see also *Riconoscimenti*—Reconnoissances). Tilgher connects the Italian movement with its romantic origins and with the French drama of Sarment, the Belgian drama of Crommelinck, the German “expressionistic” theatre, the Russian plays of Andréev, and the English work of Synge (*The Playboy of the Western World*).

To strike the contrast: the “old” Italian drama, as represented by Roberto Bracco, Sabatino Lopez, Dario Niccodemi, Marco Praga, Salvatore di Giscomio, etc., was more or less the “bourgeois” drama of Paris, reformed by Ibsen (see especially the works of E. A. Butti, who died in 1907). It accepted the social organization of Europe as a fixed organism and pressed the dramatic emotion from the conflict of the individual with the unbreakable restrictions that hemmed him in: he could evade them—the ever-recurring salacious comedy of the triangle; he could succumb to them—the ever-recurring “drama,” or tragedy, of sentimental motivation. The “new” drama, in keeping with the revival of Hegelian idealism (Croce-Gentile), but also influenced by Bergson (anti-intellectualism and the “dynamic spirit”), by American pragmatism (“the world is what we make it”) and by the forces of which Einstein is at once an interpreter and a creator (relativism), is a philosophical approach to life: What is reality? What is personality? What is morality? Where the “old” drama looked primarily at what is fixed and unchanging, the “new” centres its attention on life's contradictions, incoherences, mutations: life is a flux—therefore reality is never fixed, even people are not to-day what they will be to-morrow and what they were yesterday. We are phantoms labeled with a name: we are, as Pirandello says, “one, no one, a hundred thousand.”

The dramatists of the new tendencies are nu-

merous: Luigi Chiarelli in *La Maschera e il Volto* (The Mask and the Face); Rosso di San Secondo in *Marionette—che passione!* (Love's Puppets) and *La bella addormentata* (The Sleeping Beauty); Fausto Maria Martini, in *Ridi Pagliaccio* (Laugh, Clown, Laugh); Pensuti, *L'uomo di legna e la donna di ceva* (The Wooden Man and the Wax Woman); and Cavacchioli, author of a host of plays; but overtopping them all for the power and variety of his production, for success at home and international fame, Luigi Pirandello: *Sia Characters in Search of an Author*; *Henry IV*; *The Pleasures of Honesty*; *Right You Are! Naked*; *Each in His Own Way*; *Think it Over*, *Gimpy*; which are known in every capital of the western world.

Fad or permanent contribution as the "new" theatre might be, it bore witness to an activity which had proved stimulating to all factions of the theatre. Nino Berrini and Giovacchino Forzano came forward in a type of poetic, post-romantic historical drama in which Sem Benelli was still a recognized master, though Benelli had never surpassed his old *La Tignola* (Bookworm), and *Arzigogolo* (The Hour Glass) is inferior to his sensational *La cena delle beffe* (The Jest). One real masterpiece, moreover, distinguished a new type of fantastic classical drama—the *Glauco* of Ercole Luigi Morselli (1881-1921), author also of *Orione*, of three one-act plays and the very readable *Favole per i re d'oggi* (Fables for the Kings of Today). The epigons of *Glauco* are already numerous: let us mention only *La tela di Penelope* (The Return of Ulysses), of Raffaele Calzini.

However, in the Italy of this period we are confronted with a fascinating insurgence of new forces of which the political manifestations as-tounded everybody in the triumph of Fascismo, and of which the literary manifestations constituted, as was said above, the most distinctive feature of the decade. Aristocracy as against democracy, nationalism as against liberalism and internationalism, discipline and obedience as against the "rights of man"; counter-Reformation as against Reformation, "spirit" as against "stomach," Latinism as against Anglo-Saxon industrialism, materialism, and hygienic "civicism"—such ideas and slogans were being bandied about by young Italians with genius or without genius, in a language full of the strangest and wildest technicalities and in a style taut with straining cerebration. With these youngsters logic is in bad repute. What one must do is "experience." Struggle is the law of life! *Lottiamo!*

If the War helped to individuate these new tendencies and give them distinctness, they go back fully 20 years to self-conscious movements dating from the first lustrum of the century. The first corollary drawn from Crocean idealism by Papini and Giuseppe Prezzolini (founders, in 1903, of the review called *Leonardo*) was that life must be lived or created and not accepted or taken for granted: hence rebellion against passive politics, passive religion, passive culture. Here are to be found the remote origins of Fascism, as indeed the immediate origins of proletarian insurrectionism (the Mussolini of that day), of anti-parliamentarianism (the Mussolini of the present), of Catholic "modernism" (Ernesto Bonaiuti). In this connection also there were "revivals" and rehabilitations: if philosophical thought was influenced

by Croce, political thought found its Old Testament in the *Sociology* of Wilfred Pareto (1844-1923) and its New Testament in *La rivolta ideale* (The Ideal Revolt) of Alfredo Oriani, who lived in the last half of the nineteenth century and who was also the author of *La lotta politica in Italia*, a History of Italian Revolutions and of an influential novel, *La disfatta* (The Defeat). Over against a militant proletariat inspired by Karl Marx there thus developed in Italy a militant middle class which accepted the class struggle in socialistic terms and fought the Socialists on their own grounds with their own weapons.

This mental unrest may be sensed most fully in Papini, as above suggested—read in addition to *The Failure*, *Il crepuscolo della Filosofia* (The Twilight of Philosophy); and *Four and Twenty Minds*, especially if Papini's world-famous *Life of Christ* is to be appraised with any understanding. But hardly less important is the painter-poet Ardengo Soffici, author of *Lemmonio Boreo* (a novel that anticipates Fascism to the letter), of *Arlecchino* and many critical and political essays. Domenico Giulioti, author of a frantic and paradoxical Catholic diatribe—*L'ora di Barabba* (The Hour of Barabbas)—well styles himself the "wild man" in the *Dictionary of a Wild Man* which he wrote in collaboration with Papini. Giulioti's histrionic violence stands out in contrast with another Catholic writer of a real mystic temperament, Giosuè Borsi (1888-1915), author of *Letters from the Front*. Certain characteristic and influential states of mind may be found in Curzio Suckert, *L'Italia vivente* (The Living Italy). Though in this connection we must not forget the speeches and editorials of Mussolini himself now collected in volume forms, with his war diaries.

But when the tumult and the shouting dies, a certain bulk of unquestionably sound and coherent achievement will be left as the permanent record of this Italian period. Already the *Letters* and critical essays of Renato Serra (1881-1915) had acquired an almost classic prestige. Giuseppe Prezzolini (read *La coltura italiana*—Italian Civilization) lived all this life of thought and passion and worked it into a literary product that has judgment and fairness and character as well as brilliancy. Mario Missiroli is a publicist who saves himself many palinodes by thinking before he writes. Gaetano Salvemini entered political and social polemic with the sobriety of the historian and the courage of a warrior. In pure literature, we may mention the work of Massimo Bontempelli, *I sette savi* (The Seven Sages); *La vita intensa* and *La vita laboriosa* (The Strenuous Life and The Laborious Life); the tales of Ferdinando Paolieri (the real successor, perhaps, of Renato Fucini in the Tuscan spirit), the varied work of Enrico Pea, *Spaventaccio* (The Scarecrow) and a play—*Judas*, and the delicate humor of Giuseppe Zucca, *Il morbo della virtù* (The Disease of Virtue). A young critic from whom something was to be expected was Piero Gohetti (see *La frusta teatrale* "The Theatrical Whip").

And now, collecting some loose but important ends, we may add that Trilussa (Carlo Alberto Salustri) was still continuing, in his screamingly funny sonnets in Roman dialect, the more recent traditions of Pasarella (author of *The Discovery of America* and *Villa Gloria*), August

to Sindici, and the immortal Oronzo Marginati (Luigi Lucatelli, a prose "columnist," author, for instance, of *Come ti erudisco er pupo* 'Bringing up the Kid'; and *Così parlano due imbecilli*—Thus Spake Two Fools,' translated by Maurice Bishop as 'Theodore the Sage'). The great "dime novelists" still remained, Mario Mariani, Pittigrilli, and Carolina Invernizio (1857–1917). Authors of children's books, since the classic *Pinocchio* of Collodi, were Vamba, Beltramelli and Barzini. One of the best works of historical scholarship is Corrado Ricci's *Beatrice Cenci*. The best cook book is that of Artusi. And last but not least among the loose ends is the *Notturmo* (Nocturne) of D'Annunzio.

ITALIAN SOMALILAND. See **SOMALILAND.**

ITALY. A constitutional monarchy of southern Europe; area before the War, 110,032 square miles, population (census of 1911), 34,671,377, population for the same area by the census of 1921, 37,276,738, population per square mile (1921), 336.9 The annexed territories by the Treaty of St Germain were: Venezia Tridentina, area 4027 square miles, population (1921) 648,208; Gorizia and Gradisca and districts, area 1138 square miles, population (1921) 310,642; Trieste, area 37 square miles, population (1921) 238,655; Istria, area 2035 square miles, population (1921) 342,979; Zara and islands annexed from Dalmatia, area 113 square miles, population (1921) 18,719. Total area in 1921, 117,982 square miles; total population, 38,835,941. Comparative vital statistics for the period discussed were as follows (figures for 1912 and 1922, based on ratio per 1000 of population and applying only to pre-war boundaries): marriages, 7.6 and 8.74; living births, 32.38 and 28.55; deaths, 18.15 and 16.66. The influenza epidemic of 1918 raised the mortality to 32.97 per 1000 inhabitants (exclusive of war deaths). Emigration, which had reached its peak in 1913 with 872,598, fell off during the war years, dropping to its lowest level in 1918 with 28,311. But by 1921, emigration had once more mounted to 255,166, and in 1922, to 276,964. Whereas in 1913 almost two-thirds of the emigrants had migrated overseas, in 1920 only a few more than one-half did so. In 1922, emigrants overseas totaled 121,410; to Europe, etc., 155,554. This was occasioned by the fact that many Italians sought work in the devastated French areas, although the restriction imposed on immigration into the United States was a contributing cause. Before the War the ratio of immigrants (i.e. returning Italians) to emigrants varied from one-third to one-half. In 1921, 92,212 Italians returned, 71,974 of these being from the United States. This was 36 per cent as large as the number of emigrants. The populations of the large cities in 1921 (1911 figure in parenthesis) were as follows: Naples, 780,220 (678,000); Milan, 718,304 (599,000); Rome, 691,314 (542,000); Turin, 502,274 (427,000); Palermo, 400,348 (341,000); Genoa, 300,784 (272,000); Catania, 255,394 (211,000); Florence, 253,565 (233,000); Bologna, 210,969 (173,000); Messina, 176,794 (127,000); Venice, 171,665 (161,000); Bari, 131,143 (104,000); Leghorn, 114,813 (105,000). Principal cities in the annexed territories were: Trieste, 238,655 (1921); Pola, 49,960; Trento, 35,125; Gorizia, 25,576.

Education. In the period surveyed, the State

applied itself seriously to the problem of illiteracy and in 1919 set up a national institute for the instruction of illiterate adults. Many districts, notably in the provinces of Novara, Turin, Como, and Cuneo, could record the fact that all young people 20 years of age were able to read and write. Under Mussolini, educational legislation, while frequent, took on a reactionary tinge. Compulsory religious education, conducted by teachers receiving the approval of the Church authorities, and the displaying of the crucifix in all schools, were ordered. Limitations were also placed on the number of free students and, to this end, severe competitive examinations were fixed. In all elementary schools, public and private, there were 4,523,183 pupils in attendance in 1915–16. The increase was slight over the previous recorded year, 1907–08, as is indicated by the fact that there were 3,002,168 attending public elementary schools in 1907–08, and 3,167,245 in 1915–16. In all government and private secondary schools the enrollment in 1919–20 was 346,218. The increase in technical schools was particularly noteworthy, attendance in government schools in 1919–20 being 173,296 as compared with 103,118 in 1910–11. The eagerness for higher education was even more marked in the universities, for the attendance increased from 21,615 students in 1911–12 to 41,176 in 1919–20. In 1913–14, the state expended 137,634,000 lire on instruction; in 1922–23, it expended 658,871,000 lire. This, however, cannot be regarded as an increase, for the lira (par 19.3 cents) was quoted at 4.75 cents in 1922. If we consider that the index figure for prices and wages for January, 1923, was 575 (based on 1913 as 100), it is evident that in real money the expenditure was considerably less in 1922–23 than in 1913–14.

Agriculture. Recovery in the field of agriculture was rapid after the War, though government requisitions of crops in 1919 and 1920 made resumption somewhat tardy. The table furnishes a basis for comparison; acreages are given in thousands of acres.

Crop	1914		1923	
	Thousand Acres	Short tons	Thousand Acres	Short tons
Wheat	11,785	5,072,650	11,554	6,745,175
Corn	3,793	2,860,000	3,618	2,851,900
Oats	1,133	428,340	1,191	484,960
Potatoes	727	..	778	1,416,800
Sugar beets	101	1,540,000	148	1,904,000
Vines	10,678	1,214,400 *	12,108	726,000 *
Olives	5,678	..	7,042	528,000 *

* Thousands of gallons of wine and oil.

Orchards, yielding large crops of oranges, lemons, chestnuts, pomegranates, quinces, apples, and pears, as well as walnuts and almonds, continued to flourish, though by 1922 the crops had not yet reached pre-war levels. Silk culture, after a period of decline, assumed its pre-war importance in 1923. In the three-year period 1910–12, the silk cocoon crop averaged 41,200 metric tons. In 1922, it was 31,000 tons; but in 1923, 42,580 tons. The decline prior to 1923 was due to the destruction of the mulberry trees in Piedmont, Lombardy, and Venetia—the chief centres. After the War the factory capacity of the silk mills similarly declined, as many plants were sold during the War for their metal. Live stock figures for 1918 revealed

(1908 figure in parentheses): horses, 989,786 (955,878); asses, 949,162 (1,238,000), mules, 496,743 (1,230,080); cattle, 6,239,741 (6,198,861); pigs, 2,338,926 (2,507,928); sheep, 11,753,910 (11,162,926); goats, 3,082,538 (2,714,878). The wool yield maintained an average of 33,000 tons and had to be supplemented by importations.

Mining and Manufacturing. After the War, mining was prosecuted with a renewed intensity. The lack of coal and iron ore necessitated the dependence upon foreign sources, but in sulphur and mercury the output was of great importance. The following figures for 1922 and 1923 indicate how steady the progress was (figures in metric tons): iron ore, 311,214 and 295,450 (603,116 in 1913); iron and cupriferous pyrites, 486,000 and 493,412 (317,334 in 1913); coal, 195,352 and 168,922; lignite, 745,402 and 938,229 (total mineral fuel in 1913, 701,081), metallic mercury 1541 and 1605 (1004 in 1913). The Sicilian sulphur industry, one of the most important in the world, had not recovered by 1923 from the War's effects. The forging ahead of the American industry during 1914-18 had much to do with the general stagnation. In 1911, the production was 2,682,766 metric tons of sulphur ore and 414,161 tons of raw sulphur; in 1922, it was only 167,339 tons of raw sulphur and in 1923, 248,916 tons. In 1923, to aid the Sicilian Sulphur Consortium in carrying its accumulated stocks for a more favorable market, the Italian government guaranteed a bond issue of 100,000,000 lire. By the acquisition of the mercury mines of Idria as a result of the War, Italy became the world's largest producer of mercury. In 1922, the output was 1541 tons of mercurial ore out of about 4000 tons for the whole world. Imports of coal were always heavy. In 1913, imports of coal reached 9,000,000 tons; during the War this fell off considerably, after the War, imports did not average more than 4,000,000 tons annually, but in 1923 they rose to 9,167,269 tons. This, with other conditions, kept the output of metallurgical plants at a low level until 1923 when an improvement occurred. In 1922, 157,498 tons of pig iron were turned out, and in 1923, 247,160 tons; in 1913, the output was 427,000 tons. In 1922, 981,419 tons and in 1923, 1,121,912 tons of steel were produced as compared with 933,000 tons in 1913 and 1,331,000 tons in 1917. In 1923 only 506,000 tons of iron and steel scrap, iron ore, bars, plates, and sheets were imported as compared with 933,000 tons in 1913. The lack of mineral fuel made the development of hydroelectric resources of paramount importance. It was estimated that 5,000,000 horse power were available for exploitation. At the end of 1922, hydroelectric companies represented a total capacity of 2,170,000 horse power, which was an increase of 650,000 horse power since 1915. Consumption figures indicated: 2,312,000 kilowatt hours used in 1913-14; 4,000,000 kilowatt hours used in 1920-21. Eight-tenths of this was utilized for industrial purposes, one-tenth for traction, and one-tenth for illumination.

Commerce. Imports in 1913 were valued at \$707,664,101; in 1923, at \$775,026,883. Exports in 1923 were \$497,649,999 as against \$500,241,667. (The 1923 figures are converted from the average exchange rate for the year.) In 1913, countries of origin of Italian imports ranged in order: Germany, Great Britain,

United States, France. In 1923 the order was: United States, Great Britain, France, Germany. Countries taking Italian exports in 1913, in order, were Germany, Switzerland, United States, France, Austria-Hungary, Great Britain. In 1923 the order was, France, United States, Switzerland, Great Britain, Argentina, Germany. The trade with the United States revealed something of the character of the general commercial status. (See table.) The index figures in the table are based on the value of the average imports and exports for 1910-14.

Average	EXPORTS TO THE UNITED STATES		IMPORTS FROM THE UNITED STATES	
	Millions of dollars	Index No.	Millions of dollars	Index No.
1910-14	51	100	66	100
1920	75	148	372	563
1921	62	122	215	327
1922	46	90	198	300
1923	68	133	208	315

Italian imports continued to be such basic raw materials as wheat, raw cotton, metals and minerals, mineral oils, hides, tobacco, lard and bacon. This dependence on foreign countries for wheat and scrap iron, particularly, continually operated to Italy's disadvantage. The tendency after the War for nations to restrict their exports of important articles or to charge higher prices abroad than those asked at home, accounted for a bitterness of feeling that often was publicly voiced. Leading exports were, in order of value (1920), cotton manufactures, raw silk, silk manufactures, hemp, spun cotton, automobiles, wines, hats, etc. Leading foodstuffs exported were lemons, olive oil, cheese, fruits, vegetables, tomato conserve. In 1914, the Italian merchant marine consisted of 644 steamers of 1,534,738 gross tons and 523 sailing vessels of 237,821 net tons; in 1922, the marine consisted of 868 steamers of 2,539,833 gross tons and 397 sailing vessels of 167,613 gross tons. During the War, Italy's shipping losses were the severest, proportionately, of all the combatant nations. Thus, 677,207 tons were lost by sinkings alone, while in all, 1,076,171 tons were lost, made up of sinkings, sale to foreigners, those broken up for material, etc. However, Italy was compensated by the accretions of Austro-Hungarian ships as well as the active building carried on over the whole of 1915-22. Specifically, 842,529 tons of enemy shipping were seized; 529,214 tons were built in home shipyards; 555,388 tons were built abroad. In 1911, 173,437 vessels of 56,056,306 tons had entered Italian ports; 173,353 vessels of 56,082,448 tons had cleared. Nothing indicates better the tardy commercial recovery than the fact that in 1919 only 98,189 vessels of 24,093,639 tons entered and 98,144 vessels of 24,143,487 tons cleared Italian ports. Recovery was progressing rapidly by 1923; in the first nine months of 1923, 114,744 vessels with a tonnage of 32,314,780 entered and 114,980 with a tonnage of 32,045,878 cleared Italian ports.

Communications. In 1913, there were 11,015 miles of railway; in 1920, 12,900 miles. In 1913, 8540 miles were under government management; in 1920, 10,290 miles. A serious concern after the War was the sad state of disrepair into which the railways had fallen. The loss and depreciation of railway stocks, the overmanning of the entire system (employees had increased 46.6 per cent between 1914 and

1920), the eight-hour day and the lowered efficiency of the workers, all contributed to a general deplorable condition. The deficit of the fiscal year 1920-21 was 1,034,000,000 lire, and of 1921-22 was 966,000,000 lire; this in spite of the continually rising tariffs. (Freight rates from 1915 to 1922 increased 400 per cent.) Electrification of railways was a theme of continual discussion, though the unfavorable financial situation militated against any extensive immediate projects. As a way out, the Mussolini government expressed itself as favoring the resurrection of private management, but, while extensive reforms and reductions of personnel were carried out, no definite move, by 1924, was made toward private operation.

Finance. For 1912-13, revenues were 2,698,620,000 lire and expenditures 2,615,208,000 lire. The revised budget of 1923-24 carried 15,566,000,000 lire for effective revenues (about 5,000,000,000 lire being classified as extraordinary) and 18,182,000,000 lire for effective expenditures (of which half constituted extraordinary expenses). After 1914, the problem of balancing the budget was of utmost importance and the failure of successive governments to do so awakened a real alarm. In 1919-20, the deficit was 9534 millions of lire; in 1920-21, it was 5922 millions; in 1921-22, 5529 millions; in 1922-23, 3100 millions. For 1923-24, even after radical economies were effected, the deficit still showed 2616 millions. However, with the wide powers of the new government, its policy of reducing expenses and increasing revenues through a broadening of the basis of taxation, it was perceptible in 1924 that much was being done to hasten a return to sound conditions. Increases in revenue and economies in expenditure during the fiscal year 1923-24 were so great as to make it likely (as the situation appeared in May, 1924) that the deficit would fall as low as 300,000,000 lire. Under the new government (1923) revenues were increased by the following methods: The direct taxes were concentrated under three large heads, viz., land, buildings, and incomes. Beginning with 1923, a new sales tax became effective. Other changes were higher excise taxes, increased postal rates, abolition of the match monopoly. Italy's pre-war debt was 13,312,000,000 lire. By Mar. 31, 1923, the public debt was 116,975,000,000. War loans totaled 36,042,000,000; floating debt, 34,848,000,000; notes in circulation, 10,272,000,000; foreign debt, 22,081,000,000 gold lire or 88,000,000,000 paper lire at the 1923 exchange. Allowing for this conversion the debt really was 183,000,000,000 lire. The following was the distribution of the foreign debt in 1922 (the figure increases from year to year because of accrued interest charges): to Great Britain, 12,687,173,200 lire; to United States, 8,586,816,383 lire; to United States for dollar bonds sold in the United States, 51,604,069; dollar indebtedness to the Brazilian government, 35,722,000. In 1921 and in 1923, the Italian government gave official assurances that the debt to the United States would be met. However, it was requested that the terms granted to Great Britain be also accorded to Italy. That a general skepticism prevailed in American circles on this point, nevertheless, was indicated by the statements of Senators Borah and Owen in January, 1924, that this debt never would be repaid. Up to 1924, Italy was still leaving the question of interest payments on these obliga-

tions out of its calculations. The internal debt of Italy was, in 1924, being reduced while no increases were being made in the foreign debt except those due to interest accruals. At the end of 1922 there were 19,674,700,000 lire in paper notes in circulation as compared with 2,782,000,000 lire in 1913. Reserves represented 70 per cent of these in 1913 and only 9 per cent in 1923.

Economic Conditions. The lira exchange, at the par of 19.3 cents in 1914, dropped to 11.37 in 1919, 4.97 in 1920, 4.29 in 1921, and recovered only slightly to 4.75 in 1922, with a further slight decline to 4.60 in 1923. The cost of living based on the 1913 wholesale prices as 100, was at 642 in January, 1921, 577 in January, 1922, 575 in January, 1923 and 571 in January, 1924. Wages rose too, though not to an equal proportion. The wage index numbers, on the basis of 100 for 1914, for subsequent years were: 102.4 in 1915; 111.6 in 1916; 146.6 in 1917; 179.7 in 1918; 279.5 in 1919; 408.4 in 1920; 571.7 in 1921. Wage levels did not change greatly after 1921. The return of the soldiers and the increasing intransigency manifested by the laboring population, as the coming of peace brought renewed hardships, made the period 1919-22 one of the most turbulent in Italy's recent history. The government, sensing the unrest, hastily enacted a series of social measures in 1918 and 1919. These included machinery for the payment of unemployment subsidies, a system of unemployment insurance, the eight-hour day in many industries, for agricultural workers, and for state railway employees, compulsory old age and sickness insurance, etc. But nothing could stem the rising tide. The lack of raw materials, high prices for food, unemployment, all those conditions that indicate a population bearing too many oppressive burdens, ushered in a period of revolutionary strikes; that in 1920 threatened a complete upheaval of the existing society. In 1919, strikes were frequent; the red flag was hoisted in Tuscany and Romagna; a general strike was declared in Naples; strikes were called to check the supply trains destined for the Kolchak forces in Siberia. In 1920, disorders broke out with a renewed intensity. Throughout the spring the country was in a continual turmoil as postal employees were followed out by railway workers, to be in turn succeeded by the metal workers. In the summer, city transport workers struck and were accompanied by the electricians. In the fall these movements began to take on all the characteristics of an organized opposition. The slowing up of the important metal works in northern Italy and the attempt to cut wages accounted for a truculent mood that vented itself in frequent displays of sabotage. This, and the lack of raw materials, caused many plants to close their doors to the workers. The result was a wholesale seizure of factories throughout Lombardy and Piedmont and the installation of workers' committees of control. Materials were confiscated and an attempt made to coerce the management to remain at their posts. The General Confederation of Labor gave the movement its official sanction and took over a general supervision of the workers' activities. Only a tardy intervention on the part of the government succeeded in restoring order. On Sept. 19, 1920, representatives of workers and employers patched up a truce whereby a measure of control in opera-

tions and salaries was granted to the men, and a bill embodying this syndicalist principle was promised by the government. Meanwhile the same temper was exhibited by the agrarian workers. Landed estates were seized by peasants throughout the summer and fall, Sicily being the seat of most of the trouble. Associations were formed for the administration of the sequestered areas, and under the coöperatives, collective farming and purchasing were carried on. Many farmers extricated themselves by leasing their lands to these associations. While the outbreaks did not assume general proportions, cases of rioting and bloodshed were frequent. The unrest subsided only slowly. Strikes continued throughout 1921. There was a general strike in Rome in July, a railway strike in November, rioting and bloodshed as a result of ill-feeling between Fascisti and Communists throughout the fall. Unemployment in the metal, textile, and building industries was high. By Dec. 1, 1921, there were 512,000 men out of work. In all, 1045 strikes, affecting 644,564 workmen, accounted for the loss of 7,772,870 working days during 1921 (and these figures were less than half those for 1920). Not until late in 1922 did a return to something like normal conditions begin to manifest itself. Revivals were evident in the metallurgical and mechanical industries and investments in industrial enterprises increased. By September, 1923, unemployment had dropped to 179,000 workers, and labor disputes throughout the whole of 1923 had involved the loss of only 250,000 working days. By the beginning of 1924, observers could report that of all the Continental European countries involved in the War, Italy had made the greatest progress toward regaining its economic and financial stability.

The spread of coöperative societies was particularly noteworthy; 15,000 societies were reported in 1921 as compared with 7500 in 1915. Of the former, 7430 were united in the National League of Coöperative Societies, with a total membership of 1,857,500 and a collective share capital of more than 250,000,000 lire. After 1913, the National Institute of Credit co-ordinated the activities of most of the coöperative savings banks and credit organizations. In 1920, the capital of the Institute was 20,840,000 lire, and its turnover of ordinary current accounts (deposits and withdrawals), 1,592,000,000 lire. After the advent of the Fascisti government, coöperative societies did not receive government support, with the result that many collapsed. The more important, however, continued to thrive; notably the Federation of Agricultural Consortia, which was one of the strongest of its kind in the world.

History. Although Italy had been linked with Germany and Austria-Hungary in the Triple Alliance since 1882, the Italian government, on Aug. 3, 1914, declared its neutrality in the War, on the grounds, first, that since the War had been caused by the aggression of the Central Powers, the *casus fœderis* provided for in the strictly defensive Triple Alliance had not arisen; and, second, that by failing to acquaint Italy, in advance, with the terms of the note to Serbia, Austria-Hungary had disregarded the terms of the Alliance. As a matter of fact, by secret agreements with France (1902) and Russia (1909), Italy had pledged herself not to aid Germany and Austria-Hungary in an aggressive war. That Italians saw no rea-

son for taking their place at Austria's side was plain; and the entrance of Great Britain into the struggle removed all thought of participation against the Entente. The neutralist attitude at first was strongly championed. The low state of the finances and the fact that Italy had not fully recovered from the Libyan war (see LIBYA) together with a belief that hostilities against her erstwhile allies must be contemptuously regarded, were the more important factors contributing to this view. Some measures were taken to relieve the stringency that war conditions brought in their train. Exports of cereals were prohibited; a moratorium was declared; and steps were taken to further a ready importation of raw materials. Meanwhile the war establishment—five classes had been mobilized—necessitated great outlays of money, and a cabinet crisis precipitated over the need for tapping new sources of revenue resulted in the formation of something like a coalition government with Baron Sonnino at the Foreign Office. As the War, however, took on ever-increasing proportions and as the intrigues about the Italian Foreign Office became more numerous, it began to appear that a change had taken place in Italian public opinion, or at any rate, in official opinion. The character of the sentiment, with 1915, took on a more bellicose hue; Italy meant to join the Entente, every one saw, at a price. The recovery of the northern provinces had of course always had a certain appeal to popular sentiment, but that Italy's entry into the War was to be purely a matter of diplomatic arrangements was not to be concealed. Germany, sensing this, sent the astute Prince von Bülow to Rome in order to keep Italy neutral if possible. Austria was urged to satisfy Italian demands for territory as far as she was able. Protracted negotiations were carried on between Austria and Italy but neither of Austria's offers came up to the minimum of Italy's demands. (See TIROL, SOUTH GERMAN.) The result was, Sonnino terminated the conversations and turned to the Entente. On April 26, the secret Treaty of London was signed. By it, for full participation in the War, Italy was to receive the Trentino and South Tirol to the Brenner Pass, the city of Trieste, Gorizia, Istria, Dalmatia as far as Cape Planka, Valona (which had already been occupied on Oct. 30, 1914), the Adriatic islands, and the Dodecanese including Rhodes. Other promises of territory included a sphere of influence in Asia Minor, and grants in Africa. That the anti-war party was still strong was shown when Premier Salandra resigned because of the failure of Giolitti and his followers to approve of his policy. But war demonstrations and the agitations of D'Annunzio had touched the popular temper with the result that Signor Salandra, perceiving in what direction the wind was blowing, once more assumed the reins of office, and boldly asked the Parliament for a war declaration. On May 20, 1915, the Chamber invested the government with complete powers; on May 23, the army was ordered mobilized; and on May 24, war was declared against Austria. Later in the year, Italy declared war on Turkey and Bulgaria, but it was not until August, 1916, that she broke relations with Germany. Loans were floated in July, 1915, for 1100 million lire and in February, 1916, for 3000 million lire. On the outbreak of the War, the railways passed under military control and through 1915 and

1916 other measures were taken to facilitate an undivided war effort. These included: prohibitions on the importation of articles of luxury, the sequestration of property belonging to citizens of the Central Powers, cessation of trade with Germany, etc.

The failure of the Italian armies to make any appreciable advances on the northern frontier, the rising prices, and the delay of the government in declaring war on Germany, served to create an opposition whose operations became increasingly embarrassing to the government. The great success which met the Austrian offensive in the Trentino in May, 1916, turned the scales against the ministry with the result that a defeat in the Chamber on June 10 forced its resignation. Not until June 19 was Signor Boselli able to form a cabinet. On it, Sonnino and Orlando were retained and Signor Bissolati, leader of the Interventionists, was given a place. Up to 1917, the conduct of the war received undivided attention and met with no organized opposition. The occupation of Gorizia on Aug. 15, 1916, and the decision to participate with the Allied troops in the Macedonia offensive, as well as to extend the Albanian operations, together with the early victories reported from these fronts, united in distracting attention from affairs in the Trentino. But the terrible loss of life on the Carso-Isonzo front, the discomforts the soldiers were suffering, the failure to provide the simple amenities that might have made their position more tolerable, and, with the collapse of Russia, the realization that Austria was now free to turn her undivided attention to Italy, all served to give strength to a defeatist agitation that took on volume as the year 1917 progressed. The opposition in the Parliament continually gained new accretions. In 1917, internal disagreements caused a cabinet crisis and Signor Boselli was compelled to reconstruct his cabinet. This merely presaged the larger events of the fall of the year. The disasters that met the Italian armies beginning with October at Caporetto, on the Asiago plateau, and in the Udine and Beluno provinces, and the loss of 300,000 men as prisoners, together with great army stores, threw the Italian people into a fright that bordered on frenzy. It seemed that only a miracle could save Italy from being completely crushed. But the army resistance strengthened, and the people, in the face of danger, took new heart, so that, after a change of ministries, the war was carried on. Signor Orlando headed the new cabinet and General Cadorna was removed to be supplanted by General Diaz. The French and British sent contingents to the Italian front, and with the reorganization of the military machine and a greater industrial effort, it was possible for the government to prosecute its activities with a renewed vigor. The year 1918, however, tried the Italian people most severely. The lack of bread and coal and the very small rations of foodstuffs doled out added to the privations of the population. The peace discussions of the year, too, contributed to the general uneasiness; President Wilson's "Fourteen Points" which seemed to indicate opposition to the ambitious territorial desires of Italian nationalists, and the propaganda of the Jugo-Slavs for a recognition of their racial boundaries, which had the adhesion of Signor Bissolati and other reformist Socialists, were contributing factors. The successful defense of

the Piave and the checking of the Austrian offensive, in the spring of the year, on the Asiago plateau, relieved the situation somewhat, but it was not until the great victories that marked the battle of Vittorio Veneto (October 24-November 3) and ended in the crushing defeat of the Austrian army, that Italians could breathe easily once more. An armistice immediately followed by which Austrian troops evacuated not only Italian territories but the lands also promised to Italy by the secret Treaty of London. Italian forces were sent into the Trentino, and Dalmatia, as well as Trieste and Fiume, so that by the time hostilities were concluded, Italy was in complete possession of all the territories to which she had laid claim. The end of the War saw Italian forces engaged on six fronts, viz., Italy, Albania, Macedonia, Palestine, Libya, France. In all, 5,615,000 men had been called out, of whom 496,920 had been killed and 949,000 wounded, 220,000 of these being permanently incapacitated.

In the discussions of the peace, Italian public opinion centred not only in the necessity for the rectification of the northern frontier line (in spite of a preponderance of alien populations in some sections) but also in the need for retaining Fiume. On this matter the hostility of the Jugo-Slavs was encountered so that the settlement of the question continued to absorb Italian attention for the next three years. Italy's representatives at the Peace Conference were Orlando, Sonnino, Salandra, Barzilai, and Salvago-Raggi. These readily acquiesced to the partition of the German Africa colonies between France and Great Britain, accepting, by way of compensation for Italy only promises of slight additions to Libya and the Italian Somaliland, but on the questions of Dalmatia and Fiume they stood firm. Jugo-Slavia, however, had gained a friend in President Wilson. On Apr. 23, 1919, after protracted conversations among the Big Four had yielded no results, President Wilson issued a public statement to the Italian people in which he counseled renunciation of Fiume and Dalmatia. Instead of having the desired result, President Wilson's action only served to solidify all branches of opinion. The matter immediately became a *cause célèbre*. Orlando, having withdrawn from the Peace Conference, received an overwhelming vote of confidence in the Chamber, even the Socialists and the Laborites giving him their support. The failure, however, of the delegates to gain any concessions on this point resulted in a negative vote of confidence in the ministry with the result that Orlando was compelled to resign on June 19, 1919. Signor Nitti accepted the premiership. The increasing difficulties at home because of the lack of raw materials and the ever-recurring labor disturbances only added to the trials of the government. But interest, in large part, was diverted by the Adriatic question. The failure of the Peace Conference to bring out a settlement that could be acceptable to Italian opinion strengthened the hand of the irreconcilables, with the result that D'Annunzio, on September 12, entered Fiume at the head of a small force and confronted the peacemakers with a *fait accompli*. Public support rallied to him at once. In spite of Nitti's official disavowal, the heated protests of the Peace Conference, and the frequent clashes between Jugo-Slavs and Italians, D'Annunzio stayed on. Even the very favorable treaty with

Austria, signed at St. Germain on September 10, by which Italy gained her northern frontier, elicited no real enthusiasm. Fiume was the question of the day.

On Nov. 16, 1919, the new elections were held. The results marked the entry of a new force into Italy's political life, for 103 members were elected who belonged to the (Catholic) Popular party. For the first time since 1870, therefore, the Catholics as an official body took their place in the country's political activities. Their programme resembled in large part the typical proposals of the Centrist and Christian Socialist parties with which Continental Europe already was familiar. The Socialists were the only other well-integrated force, and succeeded in electing 160 members. Their stand was frankly revolutionary: they looked to Russia for inspiration, and the economic chaos of the moment gave them strength. The opening session of the Parliament was a noisy one, and the King's speech from the throne was greeted with derision. But in spite of the weaknesses of the constitutional parties, Nitti, by maintaining a precarious balance of power, continued in office. The year 1920 was characterized by an intensification of the same problems. The question of the Fiume settlement was no nearer a solution. The hard feeling engendered by President Wilson's insistence upon his scheme of a Fiume Free State and the fact that Italy's counter-proposal, though acceptable to the Supreme Council, was wholly rejected by Jugo-Slavia, were elements that made the tangle more and more snarled. Also, the revolutionary disorders of the year, accompanied by rioting and anarchistic outbreaks, and the mounting cost of living, indicated that Italy was living on a volcanic crater. These uncertainties were reflected in the political life. A cabinet crisis in the spring forced a reconstruction of the Nitti government; on May 12, the premier was compelled to resign, and after several unsuccessful manoeuvres, was supplanted by Signor Giolitti. The entrance of the Albanian question into the limelight involved Italy in another international controversy. In 1917, Italy had proclaimed Albania her protectorate but the status had been refused recognition by her allies. Up to 1920, an army had been maintained in the country to the general dissatisfaction of the populace, with the result that fighting broke out between Albanians and Italians in the summer. The universal attention given to the controversy, together with the support the Albanian cause found among the Italian Socialists, forced Giolitti to open negotiations with the Albanians. The result was the evacuation of the country; Valona, which had been held since 1914, being given up on Sept. 2, 1920. It was not until late in the year that the settlement of the Adriatic dispute appeared a possibility. The disappearance of President Wilson from the scene, and the realization by both Italy and Jugo-Slavia that an understanding could more easily be reached by agreement between themselves, led to the signing of the Treaty of Rapallo (Nov. 12, 1920). By it, Italy gave up Dalmatia and restored to Jugo-Slavia two small territories lying to the southeast of Istria; but received the town of Zara. On their part, the Jugo-Slavs agreed to an Italian frontier enclosing all of Istria and extending as far as Monte Nevoso. Fiume was made a Free State and was connected with Italy on the

west by a territorial corridor along the sea. It was also stipulated that the city of Susak (together with the small Baros Basin) was to be joined to Jugo-Slavia. Ratification immediately followed. It was necessary to apply force before D'Annunzio could be dislodged. In September, he had established at Fiume the "Italian Regency of Quarnero" and had promulgated a constitution which contained some rather ludicrous provisions. His refusal to accept the treaty compelled the Italian government to order a blockade against him, and this failing of any results, the ships in the harbor were given the order to open fire. From December 3 to 29, a virtual state of war existed, but on the 30th the local officials capitulated. A provisional government was set up and on Jan. 18, 1921, D'Annunzio left Fiume. In June, 1921, Italy and Jugo-Slavia signed an agreement for the creation of a port board to regulate the commerce of Fiume and other harbors in the territory. (For the ultimate solution of this dispute see FIUME-ADRIATIC CONTROVERSY.) There were other foreign problems which occupied the attention of the government in 1920 and 1921. Italy in August, 1920, signed the later discredited Treaty of Sèvres with Turkey by which Italy received important concessions in Anatolia and the right to exploit the Heraclea coal mines. In turn, Italy, by a separate understanding, agreed to relinquish the Dodecanese to Greece, except that Rhodes and two others were to be held for 15 years. A plebiscite was to determine their disposition later. In 1921, a commercial agreement was signed with Soviet Russia and the Ukraine and treaties were also concluded with Germany, Czecho-Slovakia, and Poland. Between Italy and France an ever-widening breach, not surprising in the light of the old hostility, was becoming perceptible. A French decree which denied Italian citizenship to the many Italians residing in Tunis was bitterly resented, the ill feeling manifesting itself in the attacks on the French military mission which visited Italy in October, 1921. These matters, naturally, were overshadowed by the grave internal situation in 1920. (See *supra*, *Economic Conditions*). Throughout the whole of the year, Italy was in the grip of disputes that took on the character of civil war: the seizure of the factories, the agrarian uprisings, the street fighting and the local disturbances, that, in Bologna in particular, took on all the familiar forms of a people torn by internal dissension, contributed to the general feeling of uncertainty. In the light of these happenings it was inevitable that a violent form of dissidence should manifest itself. Armed bands, strongly nationalistic in spirit, and bearing the name Fascisti, appeared in the industrial centres of the centre and north and openly attacked Socialist and Labor halls and assemblies. In Bologna, where Socialists controlled the local government, hostile attacks destroyed the labor exchange and forced into flight the Socialist officials. The same events took place at Modena, Ferrara, and elsewhere. Fascisti were meeting Socialists on their own ground, with the result that blood was frequently spilled. The reaction made itself felt in the internal policies of the Socialist party. In January, 1921, the reformist Socialists and the Communists parted company, the points of disagreement being adherence to Russia and the espousal of violent means. The Communists

and the Fascisti now came into conflict at Florence, Palermo, and Spezia. There was fighting in Rome in July and again in November, but everywhere it began to appear that Fascisti and not Communists were gaining the upper hand. The events of the next year were being foreshadowed with remarkable clearness.

Meanwhile the government was in difficulties. The price of bread, still fixed by the government, which was compelled to make purchases abroad at great losses, was the greatest cause for dissension. This, and the feeling that Parliament no longer represented the country, hastened Giolitti's decision to dissolve the Chamber. The new election, held on May 15, 1921, did not produce any startling results. Of the 535 members, 107 returned were Catholics, 122 were Socialists, 16 Communists, and 275 Constitutionalists of various shades. In the new Parliament the government's foreign policy met with the sharpest criticism, with the result that Giolitti resigned. Signor Bonomi now constituted a cabinet that represented all parties except the Socialist. His stay was not long, for criticisms appeared from all quarters. The failure to secure participation in the Four Power Treaty, the inability to cope with the economic problems and the ever-present lawlessness of Communists and Fascisti, and the antagonism that greeted what seemed a too friendly attitude toward Catholicism, precipitated a crisis. On Feb. 2, 1922, Bonomi resigned and only with difficulty could a new ministry be formed. Signor Facta eventually constituted a cabinet which fell on July 10 but was compelled to return because no other group could gain the confidence of the Chamber. The menace to the state was not Communism now, but Fascism.

The strength of the Fascisti waxed greater as the year progressed. Fascisti and Communists continued their warfare openly amid a general helplessness. There was fighting in Rome, Bologna, Genoa, Trieste, Alessandria, and Parma, and a Fascisti force took Fiume and drove out the provisional government (March 3). New recruits were continually filling out the ranks. On Aug. 21, 1922, the syndicate of railway men went over to the Fascisti; in the same month, with the connivance of the transport workers, Fascisti seized the ports of Genoa and Naples. On September 1, a body of 4000 moved on the town of Terni and captured it. In October, the Fascisti took it upon themselves to Italianize the German populations of the Trentino which had been accorded racial autonomy. The schools were closed and the local councils dismissed while the military was unable to intervene. It was thus evident that Fascism was exerting a force far superior to that of the constituted authorities. Signor Mussolini, the leader of the movement, demanded for his party the cabinet portfolios of Foreign Affairs, War, Navy, Labor, and Public works. An offer of several minor cabinet posts was tartly refused, and at the annual convention of the Fascisti at Naples Signor Mussolini declared, "either the government of the country must be given peacefully to the Fascisti, or we will take it by force." As the cohorts of black-shirted Fascisti began to mobilize against the capital, Premier Facta bowed before the impending storm and resigned office, October 26. Thereupon Mussolini, summoned by the compliant King, entered Rome in triumph, formed a cabinet on October 30, and declared, "To-day Italy has not

only a cabinet, but a government." His successful intimidation of the Chambers gained him a vote of complete authority. In the ensuing years the career of Mussolini was, in large part, the history of Italy. The conciliatory tone of the new government surprised many, and the strong measures for the economic reconstruction of the country gave a new impetus to manufacturing and trade. Opposition was stilled, the fear of the swift arm of the black-shirted Fascisti succeeding in overawing dissident groups. On December 16, Mussolini, not as head of the state, but as leader of the Fascisti, moved against all armed organizations through the creation of a newly nationalized militia of 80,000 men. Fascisti organs frankly advocated the suppression of the freedom of the press and the death penalty for the opponents of Fascism. Throughout the year 1923, Mussolini's hold tightened. The parade of reforms executed made a brave show. The desperate financial situation was manfully tackled and the budget for 1923-24 showed a smaller deficit than any previous post-war year; the middle classes were conciliated by the abolition of 9 out of the 13 sources of direct taxation; the inheritance tax was dropped; many onerous duties on necessities were removed; expenditures were cut down through the elimination of useless functionaries and the dismissal of extra employees, on the railways in particular. In the field of public works, sums were allotted for the rebuilding of Messina, the construction of aqueducts in Sardinia, the rebuilding of the harbor at Naples, and for constructing new railways in Sicily. Railways, something unheard of before, ran on schedule time, notable reforms were achieved in the Department of Justice, as many as 500 local courts and four of the five courts of cassation being suppressed. In educational matters, the changes were far reaching. Religious education was made compulsory; vocational guidance was stressed; and, as a move against too zealous an application of the democratic dogma, a limit was placed on the number of free students in state institutions. The state, too, proceeded to relinquish its participation in industry. Several state monopolies, notably the match industry, some telephone services, and concessions for building railways, were surrendered. In administration, the process of centralization went on speedily: five ministries concerned with internal affairs were consolidated into one as were also the ministries of finance and the treasury, the former practice of ministerial reports to Parliament was replaced by a single message for all the departments from Mussolini himself; the rule of merit was applied to promotions; working conditions for state employees were improved. Never were relations between Italy and the Vatican more cordial. In short, in every field of activity the new administration could point with pride to some just change or some alleviation of old distresses. Whether, however, reforms of this character had any claims to permanency or whether they had the whole-hearted approval of the Italian population it was impossible to say, at least, in 1923, for the free exercise of opinion and the give and take through which a democracy functions were almost wholly lacking.

The Communists were moved against with severity. On February 10, leaders of the party were seized and arrests in all parts of the coun-

try followed. On January 25, on a charge of interfering in politics, the General Workers' Union of Turin was dissolved; and in March, the editor of the radical Socialist *Avanti* was arrested by order of the prime minister. At Venice, Rome, and Florence, Communist disorders were put down with a high hand. A general order prohibited the publication by newspapers of false or biased reports, or reports tending to excite class hatred, or subvert the respect due to national institutions, the Pope, and the state. By the passage of an electoral reform measure in July, 1923, Fascism's hold was strengthened, for the act gave the party polling a plurality of the votes in an election two-thirds of the seats in the Chamber. On December 10, a decree was promulgated dissolving the Chamber and ordering a new election. Mussolini made it plain on that occasion that he would request a renewal of his dictatorial powers from the new Parliament.

In the domain of foreign affairs the same resoluteness of purpose was marked. It became increasingly evident that Mussolini's foreign policy was aimed at a speedy intimidation of Jugo-Slavia and the establishment of Italy in a commanding position not only in the Adriatic but in the Mediterranean as well. Several events pointed to this end. The murder on Greek soil, in August, 1923, of Italian officers on their way to participate in the delimitation of the Græco-Albanian frontier was immediately followed by a drastic ultimatum to Greece which demanded full apologies and an indemnity of 50,000,000 lire. Greece's desire to discuss the matter first, before yielding up, as she believed, her national honor, was sternly rejected, with the result that an Italian fleet was sent to Corfu and ordered to open fire. In the bombardment of the island 20 refugees were slain and 30 others wounded. Mussolini's refusal to consider the matter as lying within the jurisdiction of the League of Nations and his defiance of Great Britain even in the face of a threat to cut off his coal supply, for the moment seemed to threaten an international crisis. For a week uncertainty prevailed, when Mussolini was induced to accept the Council of Ambassadors as arbiter. On September 7, the Council decided in favor of practically all of the Italian claims: apologies were to be rendered to the Allied representatives as well as naval salutes to the flags of the Allied ships; official mass for the dead was to be celebrated at Athens; and military honors bestowed on the Italian victims. Inasmuch as the search for the murderers had been carried on halfheartedly, Greece was ordered, on September 26, to pay the 50,000,000 lire demanded as an indemnity. On the other hand, Italy agreed to evacuate Corfu before October 1. Toward Jugo-Slavia Mussolini applied something of the same methods. The execution of the Treaty of Rapallo he regarded as a surrender of Italy's just claims and upon Jugo-Slavia's insistence that the matter be brought to a close, Mussolini on August 30 dispatched a peremptory note to Belgrade in which he declared that the only settlement acceptable to Italy would be the inclusion of Susak (including the Baros Basin) in the Fiume Free Port area. Jugo-Slavia refused to be intimidated. The result was the dispatching of an Italian force into Fiume on September 16 and the establishment of a military protectorate. It is true that this did not change mat-

ters any, for it merely gave official approval to what had been a virtual Italian occupation by the Fascists over the previous 18 months. In the face of so trying an incident the Jugo-Slav government remained cool, contenting itself with the statement that the matter was to be submitted to the League of Nations which had, only shortly before, registered the Treaty of Rapallo. The crisis, however, was settled without recourse to the League. Direct negotiations led to the signature at Rome in January, 1924, of a treaty whereby Fiume was yielded to Italy and the River Eneo fixed as a boundary. Porto Barros, however, was included in Jugo-Slavia, and arrangements were made to facilitate Jugo-Slav commercial access to the sea through Fiume and Porto Barros. Furthermore, each nation pledged neutrality in case the other should be attacked by a third power, and both agreed to maintain the peace settlement (See FIUME-ADRIATIC CONTROVERSY.) In the eastern Mediterranean the same success attended Italy's efforts. In the fall of 1922, as Turkish success over Greece seemed assured, the Italian government repudiated the Treaty of Sèvres by which it had consented to the evacuation of the Dodecanese (q.v.) and indicated that it meant to prolong its occupation of the islands. The Treaty of Lausanne of 1923 put the stamp of approval on this act. By it the 13 islands in question, including Rhodes, were yielded up to Italy and not to Greece, in spite of the prevailingly Greek population. Other incidents of the year pointed to the fact that Italy meant to assume a more important position in world affairs. In November the Spanish royal family, accompanied by Rivera, was received at Rome and the conversations carried on pointed to the fact that both nations meant to adopt a common Mediterranean and South American policy. This was indicated by the insistence of Italy on representation at the Tangier Conference, and later, in January, 1924, by the sending of a mission to South America for the creation of a more cordial attitude toward both Italy and Spain. That Italy was drawing away from France and once more assuming her traditional hostility was evident. On November 16, Mussolini declared that his government was opposed to further occupations of German territory; on November 30, he indicated that he was sympathetically disposed toward granting Russia *de jure* recognition. By the adoption throughout 1923 of commercial treaties with Spain, Albania, the Baltic States, Russia, Switzerland, Austria, Canada, and Czecho-Slovakia, it was seen that attempts were being made to shake off the old economic dependences and turn to new sources for raw materials. The year 1924 opened auspiciously for Fascism. Italy, by the Treaty of Rome, had gained Fiume and was firmly established in the Adriatic. Mussolini's foreign policy continued to meet with triumph after triumph. First Jugo-Slavia, then Russia (which was granted *de jure* recognition, February 7), then Poland (which was promised, in April, a loan of 400,000,000 lire), then Czecho-Slovakia (as a result of the treaty of friendship of May 17), were drawn into the Italian European system and the hold of France on Central and Eastern Europe greatly weakened. Too, Mussolini, in June, had come to an amicable understanding with Great Britain over the Jubaland question (see AFRICA) and negotiations were under way

with Rumania for the settlement of the long-outstanding dispute over the repayment of the Italian loan. As never before, Italy was at peace with the whole of Europe. In internal affairs, Fascism seemed firmly entrenched, and every indication showed it had become an integral part of the Italian national life. In the election of April 6, the Fascisti polled 65 per cent of the vote cast and returned 375 seats to the new Chamber. The Opposition was hopelessly divided, being made up of 40 Popular party, 25 Socialists, 22 Maximalists, 17 Liberals, 17 Communists, 12 Constitutional Opposition, 11 Social Democrats, 7 Republicans, 3 Peasant party, 2 Slavs, 2 Germans, 2 Sardinian autonomists. The new Parliament was opened with the old pomp, May 24, and King, Court, and Mussolini basked in the approbation of the Roman populace. It was the calm preceding a storm. The kidnapping and murder of the Socialist deputy Matteotti, in June, the implication of members of the Mussolini Cabinet in this and other outrages, the evidences that deluged the press of the continued high-handed character of Fascisti methods, rocked Italy. The demand for constitutional liberty, for the first time in two years, once more seriously raised its head. All parties of the Opposition, except the Communists, met to present the following demands to the government: that the government restore order; that the Fascista

Militia be abolished; that all illegality be moved against. Mussolini accepted the first and third demands, temporized about the second for a time, and then completely yielded by consenting to the incorporation of the Fascista Militia into the Army. In July a reconstruction of the ministry followed and concessions were made to the Opposition by the incorporation of non-Fascisti in the Cabinet. Mussolini, by yielding to Parliament, had become like other European premiers, merely the head of a parliamentary government. See ITALIAN LITERATURE; NAVIES OF THE WORLD; SOMALILAND; TANGIER CONTROVERSY; WAR DIPLOMACY.

IVANOV, VYATCHESLAV I. (1866-). A Russian poet, one of the most learned of the moderns. He has also distinguished himself as historian, philologist, and philosopher. He joined the Decadents first as a critic and essayist. His first volume of poems, *Guiding Stars*, was published in 1903. He published three later volumes, the last one in 1917. After Pushkin, he is perhaps the greatest mold of the Russian language. In his earlier poems he used Greek words and syntax to a point of incoherence, but his later works, the majority lyrical, show no trace of this pedantry. His models were Pushkin, Dante, Petrarch, and especially Goethe. The sonnet is his favorite poetic form. Besides verse and essays he wrote some tragedies.

**JACKSON, ABRAHAM VALENTINE WIL-
LIAMS** (1862-). An American Ori-
entalist (see VOL. XII), professor of
Indo-Iranian languages at Columbia Uni-
versity since 1895. He traveled in India,
Persia and Central Asia between 1901
and 1918. He is editor of a *History of Persia*
and, among other works, of *Early Persian
Poetry* (1920).

JACKSON, CHEVALIER (1865-). An
American laryngologist, born at Pittsburgh.
He obtained his medical degree at Jefferson
Medical College in 1887 and was appointed pro-
fessor of otolaryngology in the University of
Pittsburgh, resigning in 1916 to accept the
chair of laryngology at his Alma Mater. Dr.
Jackson is one of the pioneers in the new de-
velopment of laryngology known as tracheo-
bronchoscopy, having studied under Professor
Kilian of Germany, the inventor of the broncho-
scope, an instrument which is of great value
not only in diagnosis but in the location and
removal of foreign bodies in the deep air-pas-
sages. He has been a prolific contributor to
periodical literature in various subjects which
pertain to laryngology, bronchoscopy, rhinology,
otology, etc. His first textbook, *Tracheobron-
choscopy*, appeared in 1907, and his monograph
Bronchoscopy and Esophagoscopy was issued in
1922. In 1923, there appeared in French the
volume *Endoscopie et chirurgie du larynx*. Up
to the first of the year 1924, Professor Jackson
had preserved over 1300 foreign bodies suc-
cessfully removed by him from the bronchi as
the nucleus of a museum collection.

JACKSON, FREDERICK JOHN FOAKES
(1855-). An American theologian, born
at Ipswich, England. He graduated from Trin-
ity College, Cambridge, in 1879, and was fel-
low of Jesus College from 1886, and dean and
assistant tutor at the same college from 1895
to 1916. In the latter year he was appointed
Briggs graduate professor of Christian institu-
tions at the Union Theological Seminary. In
1916, he was also Lowell lecturer in Boston.
He was a member of several learned societies
and was the author of *The Christian Church*
(1891); *Biblical History of the Hebrews*
(1903); *St. Luke and a Modern Writer* (1916);
Introductions to Church History (1920). He
also edited several theological works.

JACKSON, HENRY EZEKIEL (1869-).
An American clergyman and author, born in
Chester County, Pa., and educated at Princeton
Theological Seminary. He was ordained to the
Presbyterian ministry in 1896, and after hold-
ing several pastorates, the Community Organi-
zation of the United States Bureau of Educa-
tion at Washington, D. C., secured his services
as special agent, which post he held from 1916
to 1920. Later he became president of the Na-
tional Community Board at Washington, D. C.
His writings include: *Benjamin West, his
Life and Work* (1900); *Great Pictures as Mor-*

al Teachers (1910); *The Legend of the Christ-
mas Rose* (1914); *The New Chivalry* (1915);
*A Community Center, What It is and How to
Organize It* (1918); *The League of Nations*
(1919); *A Community Church* (1919); *What
America Means to Me* (1920); *Robinson Cru-
soe, Social Engineer* (1922); *The Thomas Jef-
ferson Bible* (1923).

JACKSONVILLE. A city of Florida. The
population increased 58.6 per cent in ten years,
from 57,699 in 1910 to 91,558 in 1920 and to
100,046 by estimate of the Bureau of the Cen-
sus for 1923. A new charter was passed by the
State Legislature in 1917 providing for an
elected council of 21 members and a commis-
sion of five members. The Mayor is elected for
two years. A bridge 3800 feet long with a
vertical lift draw was built in 1921 across
the St. Johns River at a cost of \$1,250,000.
Bank clearings rose from \$124,657,071 in 1910
to 571,389,000 in 1923, and total deposits from
\$18,102,000 to \$58,647,897, building permits in-
creased from \$3,184,940 to \$5,831,078.

JACOBS, THORNWELL (1877-). An
American educator, born at Clinton, S. C. He
graduated from the Presbyterian College, S. C.,
in 1894, and from the Princeton Theological
Seminary in 1899. In the same year he was
ordained to the Presbyterian ministry and was
pastor in North Carolina for several years fol-
lowing. In 1915, he founded, at Atlanta, Ga.,
Oglethorpe University, and was its president
from that date. He is the author of *The Law
of the White Circle* (1908), *Midnight Mummer*,
poems (1911), *The Oglethorpe Story* (1916);
Life of Plumer Jacobs (1918).

JACOBSEN, SIEGFRIED (1881-). A Ger-
man writer. He was born in Berlin and stud-
ied at the university. He became dramatic
critic of *Die Welt am Montag* and in 1905
founded his own magazine devoted to the
drama, *Die Schaubühne*, through which he ex-
ercised considerable influence over the theatrical
life of Germany. He was also dramatic cor-
respondent for *Die Zeit* and other Viennese papers.
He is the author of: *Das Theater der Reichs-
hauptstadt* (1904); *Mam Reinhardt* (1910);
Der Fall Jacobsen (1913); and *Die ersten Tage*
(1917).

JACOBY, HENRY SYLVESTER (1857-).
An American educator, born at Springtown,
Pa. He was graduated from Lehigh Universi-
ty in 1877 and during the season of 1878 was
connected with the topographical corps of the
Pennsylvania Geological Survey. During 1879-
85, he was chief draftsman in the United States
Engineer's Office in Memphis, Tenn. In 1886,
he returned to Lehigh, where until 1890 he was
instructor of civil engineering; he then accepted
a call to Cornell, where in 1897 he became pro-
fessor of bridge engineering. Professor Jacoby
has long been a fellow of the American Asso-
ciation for the Advancement of Science and in
1901 presided over the Section on Engineering,

with the rank of vice-president, and was president of the Society for the Promotion of Engineering Education in 1915-16. Besides numerous papers on his specialty of bridge engineering, he is the author of: *Notes and Problems in Descriptive Geometry* (1892); *Outlines of Descriptive Geometry* (Part 1, 1895, 2, 1896; 3, 1897); *Text Book in Plain Lettering* (1897); with Mansfield Merriman, *Text Book on Roofs and Bridges* (1890-8); with R. P. Davis, *Foundations of Bridges and Buildings* (1914); and *Structural Details, or Elements of Design in Timber Framing* (1919).

JAENSCH, ERICH R. F. (1883-). A German philosopher and director of the psychological institute and philosophical seminary at Marburg. He strives for a closer relation between philosophy and psychology and has written among other works *Evangelium allgemeine Fragen der Psychologie und Biologie des Denkens* (1920).

JAGGAR, THOMAS AUGUSTUS (1871-). An American geologist, born in Philadelphia, Pa. He was graduated at Harvard in 1874, and received his Ph.D. in 1897; he also studied at Heidelberg and at Munich. In 1895, he became an instructor of geology at Harvard, where he remained until 1906, attaining in 1903 an assistant professorship. Then he accepted a call to the Massachusetts Institute of Technology, where he was professor of geology and head of the Department. During 1898-1904 he also served the United States Geological Survey as an assistant geologist. He was director of the Hawaiian Volcano Observatory (1912-19) and in 1919 became volcanologist to the United States Weather Bureau, stationed in Hawaii. Volcanology has been his specialty and he has studied chiefly the volcanoes of the Aleutian Islands, Hawaii, Japan, Italy, New Zealand, and Central America, to most of which he has made expeditions, and descriptions of which he has published in papers or reports, notably those of the Hawaiian Observatory. Dr. Jaggar also delivered popular lectures on the phenomena of volcanoes, illustrated by photographs of his own making.

JAGIĆ, VATROSLAV (1838-1923). An Austrian philologist, (see VOL. XII). His recent works are *Beitrag zur Erforschung der altkirchenslavischen Evangelientexte: Evangelium Bucovinense* (1916) and *Zum altkirchenslavischen Apostolus* (1919-21). He also edited Johannes Paprek's *Slavische Brautwerbungs- und Hochzeitsgebräuche* (1914).

JAGOW, GOTTLIEB VON (1863-). A German diplomat (see VOL. XII). He was state secretary for foreign affairs from 1913 to 1914, and was retired in 1916. He added to the literature of the War with his *Ursachen und Ausbruch des Weltkrieges* (1919).

JAHN, GEORGE MAX (1885-). A professor at the technical high school of Braunschweig. He was born in Leipzig and studied history, philosophy and political science at the universities of Leipzig and Jena. He was director of the municipal high school for girls in Jena and lecturer on political economy at Leipzig. He is the author of: *Die Gewerbepolitik der deutschen Fürsten vom 16. bis zum 18. Jahrhundert* (1909); *Verstaatlichung und Vergesellschaftung* (1919); *Grundzüge der Volkswirtschaftslehre* (1920). He also edited several economic magazines.

JALOUX, EDMOND (1878-). A French

novelist. His works include: *L'Agonie de l'Amour* (1899); *Les Sangsues* (1904); *Le Jeune Homme au Masque* (1905); *L'Ecole des Mariages* (1907); *Le Démon de la Vie* (1908); *Le Reste est Silence* (1909); *Le Boudoir de Proserpine*; *L'Eventail de Crêpe* (1911); *Fumées dans la Campagne* (1915); *L'Incertaine* (1918); *Les Amours Perdues* (1919); *Au dessus de la Ville*; *Vous Qui Faites l'Endormie* (1920); *L'Ennemi des Femmes* (1921); *L'Escalier d'Or*; *Les Profondeurs de la Mer*, *Les Barricades Mystérieuses*; *Le Roi Cophétua* (1922).

JAMAICA. An island of the British West Indies; area, 4207 square miles; population in 1911, 831,383 and in 1922, 885,692. According to the census of 1921, the East Indian population was 18,610 as compared with 17,380 in 1911, and the Chinese 3696 as compared with 2111. Kingston, the capital, had 62,707 inhabitants in 1921 and 57,379 in 1911. The leading activity of the population continued to be agriculture. Sugar cane once more advanced to a place of importance, the acreage under the cane being 55,431 in 1921-22 (31,753 in 1912-13). Other crops with their acreages in 1921-22 were (1912-13 figure in parentheses): bananas, 58,282 (81,071); coffee, 19,918 (22,275); coconuts, 38,183 (17,377); cocoa, 14,673 (11,236); ground provisions, 69,159 (99,632). The year 1922, from the planters' point of view, was one of deficient rainfall, and in some sections of the island acute conditions of drought prevailed so as to cause serious loss and suffering to the community. The reflex consequences of the rainfall of 1922 were, however, shown in the cases of some crops, such as sugar. The sugar industry achieved the high record of 50,655 tons of sugar, or more than double the quantity exported in 1921. Exports in 1922, in the order of importance, were bananas, sugar, logwood extract, coffee, coconuts, cacao, logwood, and rum. The values of imports in 1912, 1920, 1921, and 1922 were, respectively, £3,040,500, £10,313,282, £5,473,800, and £4,581,000. Exports for the same years were valued at £2,709,283, £7,146,010, £3,357,700, and £4,623,700. The export figures reveal the fact that the declining prices of 1921 recovered their stability during 1922 and may be said to have been more or less normal. Imports and exports from and to the United Kingdom in 1922 were (1912 figure in parentheses): £1,301,562 (£1,333,352) and £1,120,593 (£358,516). For the United States: £2,091,591 (£1,273,389) and £2,284,838 (£1,618,614). There was no change in administration. Women were enfranchised in 1919. Government accounts follow for 1922-23 (1912-13 figures in parentheses): revenue, £2,057,412 (£1,432,400); expenditure, £1,949,034 (£1,549,667); public debt, £3,662,000 (£3,843,974).

JAMES, HERMAN GERLACH (1887-). An American lawyer and author, born at Philadelphia, Pa. He was graduated from the University of Illinois in 1906 and studied law at the Harvard Law School. In 1909, he was admitted to the bar and after official service in Santiago, Chile, was lecturer at the University of Leipzig in 1911. In 1912 he became a member of the faculty of the University of Texas as professor of government. During the War he served as organizer and representative of the War Camp Community Service. He was a member of many economic and learned societies and was the author of several books on legal

and municipal subjects, including *A Handbook of Civic Improvement* (1915), *Municipal Functions* (1917), and *Local Government in the United States* (1921).

JAMIESON, CHARLES CLARK (1866-). An American engineer, born at Glover, Vt. He was graduated at the United States Military Academy in 1892, became a second lieutenant in the 15th Infantry, and continued in the United States army until 1906, when on account of disability in line of duty he was retired with the rank of major. In 1910, he was recalled to the service but was again retired in 1918, having in the meanwhile attained the provisional rank of brigadier-general in the National Army. He later became connected with various engineering undertakings, notably with George W. Goethals and Company. During the War he was on duty in Washington as assistant to the chief of production division, then its chief, and later as special assistant to the chief of ordnance until 1918, when he was made director of sales of property acquired by the War Department after Apr. 6, 1917.

JANET, PIERRE (1859-). One of the foremost French psychologists, born in Paris. Nephew of the philosopher Paul Janet, he combined in his education a deep philosophical culture and a thorough mastery of the medical sciences. Like Freud, he was the pupil of the great French alienist, Charcot, but he developed the latter's theories along lines much more sober than those of his Viennese colleague. After teaching philosophy in a lycée at Le Havre, he began to devote himself to a clinical observation of psychopathic cases. His first work, *L'Automatisme Psychologique* (1889), singled him out as a leader in this field. Then followed in succession researches on hysteria, *L'Etat Mental des Hystériques* (2 vols., 1893) and on neuroses, *Névroses et Idées Fixes* (2 vols., 1898). In 1903, he founded the *Journal de Psychologie*, and on the death of Ribot he succeeded to the latter's chair at the Collège de France. He was elected in 1918 to the *Académie des Sciences Morales et Politiques*. Professor Janet made two visits to this country as the representative of French psychology. On his first visit, he delivered a course of lectures on *The Major Symptoms of Hysteria* (published 1908).

Without building a system, M. Janet oriented his psychology around the notion of a hierarchy of states of consciousness, ranging from conscious reflection to a biological automatism that is almost indistinguishable from the mechanism of a machine. No attempt is made to "construct" consciousness, but all analyses are made from within conscious experience.

Besides the works mentioned above, M. Janet is the author of *Obsessions et la Psychasténie* (2 vols., 1903), *Les Médications Psychologiques* (3 vols., 1919-21), and *La Médecine Psychologique* (1923). See PSYCHOLOGY, ABNORMAL.

JANEWAY, THEODORE CALDWELL (1872-1917). An American physician, son of the late Dr. E. G. Janeway. He was born in New York City, took his bachelor's degree at Yale and received his medical degree from Columbia (College of Physicians and Surgeons) in 1895. He followed in the footsteps of his father as diagnostician and consultant, was visiting physician to St. Luke's Hospital and in 1907 became professor of the practice of medicine at his alma mater, resigning in 1914 to occupy the chair of

medicine at Johns Hopkins, where he was also physician in chief of the University Hospital. He was very active during the War and his labors are believed to have caused his premature decease at the age of 45. Dr. Janeway did much to promote the study of blood pressure and his only publication in book form is *Clinical Study of the Bloodpressure* (1904).

JANIS, ELSIE (?-). An American actress born in Columbus, Ohio. She first appeared on the stage as Cain in *The Charity Ball* (1897); played in vaudeville (1898-1903); then starred in *The Belle of New York* (1904). She appeared later in *The Fortune Teller* and *The Duchess*, and starred in *The Vanderbilt Cup* (1906-08). Under the management of Charles B. Dillingham she took the leading rôle in *The Hoyden*, *Fair Co-ed*, *The Slim Princess*, and also in *Elsie Janis and Her Gang* (1920), of which she is the author.

JAN MAYEN. This Arctic island, in about 71° north latitude, 8° west longitude, is equidistant from Greenland and Spitzbergen. Discovered by Hudson in 1607, it later became economically important through its occupation by the Dutch whalers. With the decadence of that profitable fishery, Jan Mayen was abandoned and became a no-man's land. Fog-beshrouded, it has been rarely visited. From 1920 it was occupied by Norway. The meteorological station established there was sending to Christiana daily wireless reports, which were proving valuable in forecasting the advance of the violent and destructive gales of the North Sea.

JANSON, KRISTOFER NAGEL (1841-1917). A Norwegian author (see VOL. XII). Among his last works are: *Aspasia*, novel (1914), *Norske Eventyr som taletikster* (1915); *Mangslags kjaerlighed*, published posthumously in 1923.

JANTZEN, HERMANN (1874-). A German writer. He was born at Breslau and studied at the university of that city. He was director of the Victoria Institut of Breslau (1900-05), then went in the same capacity to the Königin Luise Institut at Königsberg. His works include: *Geschichte des deutschen Streitgedichts im Mittelalter* (1896); *Gotische Sprachdenkmäler* (1898); *Saxo Grammaticus* (1901); *Deutsche Literaturgeschichte* (1904); *Königin Luise* (1910); *Ostpreussische Sagen* (1912); *Von deutscher Schule und Erziehung* (1915); *Ueber Erziehung und Unterricht* (1918). He also edited: *Literaturdenkmäler des 14. und 15. Jahrhunderts* (1903); *Goethe's Egmont* (1914); *Hebbel's Nibelungen* and *Agnes Bernauer* (1919); and Grillparzer's *Sappho* (1903).

JAPAN. An empire of the Far East. It consists of Japan proper, made up of the islands of Hondo, Shikoku, Kyushu, Hokkaido, and of Chosen (Korea), Taiwan (Formosa), Karafuto (Sakhalin), as well as 600 smaller islands, including the four archipelagoes the Pescadores, Agasawara (or Bonin group), Okinawa (or Linchu group), Chishima (or Kuriles). The total area is 268,330 square miles. The total population of Japan, according to the census of 1920, was 77,005,510, distributed as follows: Japan proper, 55,961,140; Formosa, 3,654,398; Karafuto, 105,765; Korea, 17,284,207. The density of population was 286 to the square mile. One-sixth of the land was under cultivation, and the population was predomi-

nantly rural, 41 per cent of the people living in villages of between 2000 and 5000 inhabitants, 19 per cent in towns of between 5000 and 10,000 inhabitants, and 9 per cent in towns of between 10,000 and 20,000 inhabitants. Only 12 per cent of the population were in cities of over 100,000 inhabitants. In 1920, there were 581,431 Japanese residing abroad: 274,565 in Asia; 2944 in Europe; 135,667 in North America; 47,571 in South America, and 120,612 in Oceania, principally in the Hawaiian Islands, where 112,221 Japanese resided. There were 115,533 Japanese in the United States proper, 77,230 in California alone. Principal cities, 1920: Tokyo, 2,173,162; Osaka, 1,252,972; Kobe, 608,628; Nagoya, 429,990; Yokohama, 422,942; Kyoto, 299,689.

Foodstuff Production. The principal foodstuff and agricultural product was rice, the 1922 crop amounting to 309,570,000 bushels. It was still necessary to import, principally from Siam, China, Indo-China, and the United States, 3,006,688 bushels during 1922 in order to feed the population. In 1913, Japan produced 249,264,000 bushels of rice and imported 1,212,300 bushels, so even with increased production of 25 per cent imports tripled showing the tendency of population to outstrip food supply. During 1922 about 29,265,000 bushels of wheat were produced and 18,000,000 bushels imported. This was an 8 per cent increase in production and a 300 per cent increase in imports of wheat over 1913, indicating the growing use of wheat in the form of vermicelli as a substitute for rice. In 1921, about 44,252,000 bushels of barley were produced, nearly a 20 per cent decline since 1913, when 52,784,000 bushels were produced. This was due to the greater profit in wheat growing. In 1921, Japan raised 36,126,000 bushels of rye, and in 1920, 11,305,000 bushels of millet, the latter showing quite a decline from the 19,537,000 bushels produced in 1913. These latter grains furnished a valuable food for the poorer farmers who had to sell rather than consume their own rice. In 1920, Japan produced 4,137,430 bushels of white potatoes, almost double the 2,845,500 bushels produced in 1913, and 1,081,440 bushels of sweet potatoes, considerably more than the 829,767 bushels produced in 1913, the latter being a popular article of diet for the poor classes. Japan also produced in 1920, 21,180,000 bushels of soya beans. This was 50 per cent greater than the 1913 production of 14,845,000 bushels, the beans being used for making bean curd, to replace butter, and soya sauce. Also there were grown 5,297,000 bushels of red beans (almost double the 2,976,000 bushels of 1913) used as a supplement to the rice diet; 2,613,000 bushels of horse beans (slightly more than the 2,425,000 bushels of 1913), and 1,500,000 bushels of peas (a decline from the 1,847,000 bushels of 1913, other food crops being found more nutritious and profitable).

In 1921, Japan produced 143,000,000 pounds of leaf tobacco, the manufacture of which was a government monopoly. This was a substantial increase over 1913 production of 111,000,000 pounds. Other products included rape seed, indigo, hemp, sugar cane and crops of vegetables, including radishes, turnips, cabbages, flax, peppermint, and ginger, all in small quantities.

Raw Material Production. Raw silk was the most important money crop and was a subsidiary household occupation of the rice farmer.

It was produced throughout Japan, the principal districts being to the north and west of Tokyo in the centre of the main island. In 1921, production of raw silk amounted to 51,577,813 pounds, as against 30,900,000 pounds in 1913, and waste silk (produced by combing cocoons which have been pierced by the silk moth) to 19,650,659 pounds as against 9,086,000 pounds in 1913. Constant experimentation for the elimination of diseased eggs brought about this increase. This was approximately two-thirds of the world's silk production. In 1921, Japan exported 34,849,724 pounds of raw silk, and in 1922, 45,777,536 pounds, valued at \$335,023,771, 90 per cent of which went to the United States in each year. In 1921, Japan produced 96,350,000 pounds of tea, as against 72,520,000 pounds in 1913, one-fourth being produced in Formosa. Because of cheaper labor in India and Ceylon, Japan's tea production did not increase in proportion to world consumption in recent years. Practically all of Japan's tea, of which 28,478,133 pounds was exported in 1922, went to the United States.

Forestry. In 1920, Japan had a total of 54,842,000 acres in forests, 40 per cent of which was held by private individuals and corporations, 35 per cent by the state, 5 per cent by the Imperial household, and 20 per cent by communities. Due to a consistent reforestation policy this showed substantial increase over the 46,305,000 acres in 1913. Principal types of forest growth were pines, spruce, fir, cryptomeria, chestnut, oak, ash, beech, maple, cherry, magnolia and bamboo. Due to this policy of conservation of timber resources, Japan's imports of lumber increased from 8,734,356 cubic feet in 1920 to 33,593,670 cubic feet in 1921, mostly from the United States for construction purposes. In 1922, about 326,000 tons of wood pulp were produced from forests in Japan proper, Karafuto, and Korea. Considerable wood is used in the toy and match industries. Japan had almost a complete monopoly of the camphor supply of the world. The camphor tree grew most profusely in Formosa and had to be completely destroyed to obtain the product, which was distilled from the water in which the wood was boiled. The production declined as the trees became more inaccessible; 2,006,000 pounds were produced in 1921, only about one-third the 1913 production. In 1922, camphor exports totaled about \$3,600,000 in value, two-thirds of which went to the United States.

Minerals. In 1922, Japan proper produced 26,221,000 metric tons of coal, as against 21,315,000 tons in 1913, principally in the northern part of Formosa, in Kuyushu, Korea and Hokkaido. Coal exports in 1922 were 1,691,000 tons, only about two-thirds of the 1921 figures. Imports increased one-third to 1,169,000 tons in 1922. Japan produced 52,354 tons of copper in 1922, a steady decline from 1913 production of 73,940 tons and from peak figures of 79,128 tons in 1917, due to relatively high production costs. For the same reason, exports practically stopped in 1922 as Japanese copper prices were higher than world prices. Other mineral production in 1922 was: pig iron (including Korea) 77,262 metric tons, compared with 71,273 in 1913, and 514,361 tons at the war peak of 1918; iron sulphide ore, 113,015 metric tons; petroleum, 85,639,969 gallons in 1922 (amounting to half the annual consumption), compared with 81,179,000 gallons in

1913; silver, 3,940,874 ounces; and gold, 240,866 ounces produced in 1922 (mostly from Korea) compared with 4,680,000 ounces of silver and 177,000 ounces of gold produced in 1913.

Fisheries. The annual catch of Japan was about \$230,000,000 in value. In 1921, 1,755,965 long tons of fish were caught, 1,124,977 long tons for food, and the remainder for oil and fertilizer. Annual exports about \$8,000,000.

Pastoral Activities. In 1920, there were only 1,469,000 horses in Japan, a decline from the 1,579,000 in 1914, most of the draught work being done by human beings. There were 1,376,000 cattle in the same year, 133,332 goats, and 528,112 swine, as against 1,387,000 cattle, 45,000 goats and 332,000 swine in 1914. The area available for grazing in Japan proper was very limited, owing to the large amount of level land needed for rice cultivation and the very mountainous nature of the remaining terrain. Especial efforts on the part of the government were made during this period to increase the number of goats and swine. The number of sheep also increased from 2771 in 1914 to 8519 in 1920 through special encouragement to foster wool production.

Industries. The industrial population of Japan was slightly over 5 per cent of the total adult labor power of 31,000,000, amounting in 1921 to 1,686,353 people and 916,252 in 1913. Of this 1921 total, 945,788 were engaged, as against 609,638 in 1916, in textile factories; 249,102 in machine and tool factories, compared with 146,477 in 1916; 171,249 in chemical works and 105,139 in 1916; 143,554 in breweries, tea-drying establishments, flour and rice mills, compared with 44,908 in 1916; and 154,908 in printing, woodenware, gas and electric works, and foundries, compared with 79,188 in 1916. Government works employed 15,752 in 1921, a tremendous reduction from 157,902 in 1916, most of whom were in military factories. Wages paid laborers ranged in 1921 from 40 cents per day paid female silk spinners to \$1.50 per day for bricklayers. In 1913, the former were paid 14 cents per day and the latter 55 cents. In most trades, however, the yearly bonus and the separation bonus, received by an employee on his discharge, brought these figures up to 10 per cent more. Japanese labor was relatively inefficient compared with European and American labor, four or five persons being required as a rule to do the work of one skilled western workman.

Electricity. About 90 per cent of Japan's electric power was hydroelectric, 1,526,718 kilowatts being produced in 1921. This was nearly three times the kilowatt production of 1913, which was 596,856 kilowatts. Japan manufactured its own electric lamps, telephone and telegraph apparatus, and many of the motors and other apparatus used. There were 174,000 motors in use in 1921, 18,144,000 electric lamps supplying 6,986,000 households, 26 per cent of the supply being located in the six principal cities. \$381,000,000 was invested in the electrical industry in 1919, compared with only \$93,000,000 in 1916. Japan has available water power to supply approximately 2,330,000 kilowatts and this capacity was rapidly being filled. \$38,000,000 was the value of the output in the electrochemical industry in 1921, compared with \$59,000,000 in 1916, mainly in the manufacture of galvanized copper, calcium carbide,

nitrogen fertilizers, caustic soda, iron and steel alloy, cement and bleaching powders. This value of output had declined from \$88,000,000 in 1918, in which year large amounts of the product were for export. This fall was due to return to normal conditions, when it was found that domestic products could no longer compete on the world markets due to high production costs in Japan.

Cotton Spinning. \$143,399,000 was invested in cotton-spinning companies in 1921, operating 3,838,000 spindles, compared with \$42,910,000 in 1914 and 2,606,004 spindles in 1914. By April, 1923, the spindleage had increased to 4,172,384. This was just double the number operating in 1911. These spindles worked an average of 21 hours a day in 1922, producing in that year 2,228,307 bales of cotton yarn (compared with 1,666,184 in 1914), the largest amount in the history of the industry. Despite the destruction or temporary dislocation of 776,748 spindles in the earthquake of Sept. 1, 1923, the production for that year was 2,155,954 bales. A little over 15 per cent of this production was exported (394,062 bales) in 1922, the principal market being China. In 1914 when the production was 30 per cent less than 1922, Japan exported 569,999 bales of cotton yarn. The growth of the cotton industry in China, Japan's principal market, accounted for this decline.

Cotton Weaving. In 1921, 4556 cotton textile mills (employing five operatives or over), with 54,994 looms and employing 137,381 operatives produced \$332,000,000 worth of cotton textiles, consisting principally of 115,199,000 pieces of narrow and 834,503,000 yards of wide white cloth, 46,026,000 pieces of striped stuff, 203,865,000 yards of flannel, 5,879,000 pieces of crepe and 7,447,000 dozen towels, about two-thirds of which was consumed at home and the remainder of which went to China, India, and the Dutch East Indies. In 1913, 2087 mills with 85,565 operatives produced \$82,500,000 worth of cotton textiles consisting of 90,578,000 pieces of narrow white cloth, 23,588,000 pieces of striped stuff, 3,102,000 yards of flannel, 5,702,000 pieces of crepe, and 5,277,000 dozen towels. About 10 per cent of the looms were put out of commission in the earthquake.

Woolen and Worsted Weaving. In 1921, 932 factories and 17,868 looms, employing 32,534 operatives, produced \$81,000,000 worth of woolen fabrics, including 53,265,000 yards of muslin, valued at \$35,000,000. Other products included woolen cloth, \$11,000,000; flannel, \$1,900,000; serges, \$1,350,000; blankets, \$1,350,000; and all other, \$21,000,000. Muslin output in 1913 had been 69,585,000 yards of which only 760,000 yards were exported. During the War most of the mills concentrated on production of serges and woolen cloth for uniforms, principally for Russia, leaving the stable muslin industry unorganized to combat post-war competition.

Chemicals. 21,920,000 pounds of caustic soda were produced in 1921 compared with 16,088,000 pounds in 1915, as well as 7,500,000 pounds of bleaching powder and 93,300 tons of superphosphate; while 64,570 tons of sulphuric acid were produced by 12 leading companies in the same year. Japan also produced 480,208,000 dozen matches in 1921, quite a decline from the 620,772,000 dozen in 1913 when Japanese

labor was relatively cheap. In 1920, 4,684,000 pounds of celluloid from domestic camphor, a great increase over the 1912 production of 412,000 pounds, due to growing demands for Japanese toys and other celluloid products produced under a systematic preference to camphor allotment for domestic manufacture at the expense of foreign celluloid producers.

Pottery, Glassware, Lacquerware, Brick and Cement. In 1921, Japan produced \$27,000,000 worth of porcelain and pottery (\$8,500,000 in 1913), \$5,000,000 worth of ordinary brick (\$2,400,000 in 1913), \$24,000,000 of tiles (\$5,900,000 in 1913), \$2,000,000 of pipes (negligible in 1913) and \$1,900,000 of fire brick (\$700,000 in 1913). In the same year, \$28,000,000 worth of glass and glassware were produced (\$3,500,000 in 1913), including plate glass, window glass, bottles, beads, and mirrors. The 1920 lacquerware production of dishes, vases, etc., was \$10,595,000, compared with \$4,350,000 in 1913; also, 7,686,000 barrels of Portland cement were produced in 1921, a considerable increase from the 1914 production of 2,207,500 barrels. The need for concrete construction to resist earthquake shock raised the productive capacity to 17,000,000 barrels in 1924.

Sugar Production and Refining. Sugar was produced in the Okinawa group (Loochu Islands) and in Formosa. There were in all 56 mills with a daily capacity of 38,600 tons in these islands, and 13 mills with 16,300 tons daily capacity in Japan proper. In 1921, Japan proper actually refined 335,000 tons of sugar, and Formosa produced 2,080,000 tons of cane, 234,000 tons of coarse, 38,000 tons of raw sugar, and refined 38,000 tons of sugar, shipping 244,000 tons in all of all three grades to Japan proper and exporting abroad 14,000 tons. In 1913, only 73,190 tons of sugar were refined in Japan proper, from 70,186 tons of crude material imported from Formosa. In 1913, 362,534 tons of sugar were imported from foreign countries, principally from Java. In 1920, this had fallen to 126,285 tons, showing the tendency in the development of the Formosan industry.

Sake, Beer, and Soy Brewing. In 1920, Japan produced 552,000,000 gallons of sake, the national liquor brewed from rice, 26,370,000 gallons of beer, and 134,068,000 gallons of soy sauce, brewed from wheat, salt, and soya beans and used like Worcestershire sauce in the native dietary. This was more than double the sake production of 1913, which was 214,048,000 gallons, and much of Japan's rice shortage was attributable to this fact. It was three times the beer production of 9,398,000 gallons in 1913. The soy production shows only a relatively slight increase over the 112,730,000 gallons production of 1913.

Iron and Steel. In 1921, 566,531 tons of pig iron and 557,286 tons of steel were produced, about half the estimated consumption. This shows small progress over the 345,600 ton production of pig iron and 405,100 ton production of steel in 1915. Japanese iron works had a capacity of 1,412,000 tons of pig iron (400,000 government owned and 1,012,000 private owned) and 1,033,000 tons of steel (750,000 government and 283,000 private). It was difficult to increase production to capacity because of competition from the United States and India. Only 87,000 tons of this production represented ores in Japan proper, the balance of 765,000 tons of iron ore coming from China

(70 per cent), and from Korea and Formosa (30 per cent).

Shipbuilding. Shipyards, which had increased from six in 1913 to 51 in 1918, fell to 27 in June, 1921. Only 59,000 tons were launched in 1922 compared with 619,064 tons in 1919. Amalgamation of small companies into larger units kept capital invested in this industry steady at \$72,000,000.

Communications. In 1921, Japan had 135,293 miles of telegraph, and 864,114 miles of telephone wire in operation, all under government ownership, compared with 121,677 miles of telegraph and 503,302 miles of telephone in 1914. Japanese-owned cables connected Japan with China, Siberia, the Philippines, Guam, and the outlying possessions in the Pacific. Danish and American-owned cables entered Japan, but the government operated the radio stations. Japan had 300,000 miles of roads, but only one or two were highways wide enough to permit use of automobiles, most of them being built for narrow-tread native carts and rickshaws. The 346,000 bridges, except those on the 1500-mile Tokkaido highway, extending from Nagasaki to Tokyo, and a few other wide roads, were mostly too narrow and too light for motor vehicles. There were 8475 miles of railway in Japan in 1921, 23 per cent, mostly short lines, being privately owned, and the balance, mostly trunk lines, being government owned. Only a few miles were as yet electrified. In 1913, there were 5987 miles of railroad. Canals were important only in the areas around Tokyo and Osaka, which are located on plains near shallow bays. Canal systems in these cities were important transportation factors.

Shipping. In 1921, Japanese steamer tonnage amounted to 3,206,125 compared with 1,513,000 tons in 1913 and sail tonnage to 1,259,934 compared with 487,000 tons in 1913. After 1920, Japanese shipping was greatly affected by decrease in tonnage which had fallen to Japanese ships as a result of withdrawals of European ships during the War. In 1922, 13,451 steamers and 447 sailing vessels entered Japanese ports, representing 35,795,276 and 65,037 tons respectively. During the same year, 13,421 steamers and 489 sailing vessels cleared, representing 35,556,897 and 69,561 tons respectively. The principal ports of entrance were, in order of importance, Kobe, Yokohama, Osaka, Moji, Yokkaichi, Nagoya, Wakamatsu, Nagasaki, Tsuketoyo, Shimija, Otahu (in Hokkaido), Tsuruja, Miike, Naha and Hakata. Those of clearance were Yokohama, Osaka, Koike, Moji, Nagoya, Shimija, Nagasaki, Otaru, Wakamatsu, Miike, Hokodate (in Hokkaido), Shimonoseki, Yokkaichi, Karatsu and Tsuruga.

Foreign Trade. In 1922 the total exports were \$818,725,908, of which raw silk was 41 per cent, cotton yarn 7 per cent, cotton shirting and sheeting 5 per cent, cotton tissue 5 per cent, habutai (woven silk) 3 per cent, pongee 2 per cent, coal 2 per cent, potteries 1 per cent, refined sugar 1 per cent, tea 1 per cent, knitted goods 1 per cent, paper 1 per cent, matches 1 per cent, machinery 1 per cent, lumber 1 per cent, waste silk 1 per cent, cotton crêpe 1 per cent, hardware 1 per cent, glassware 1 per cent, and all others 23 per cent. The United States took 45 per cent of Japan's exports, including 90 per cent of the raw silk, 25 per cent of the silk goods, 33 per cent of the pottery, 90 per cent of the tea, and 3 per cent of the paper.

China took 24 per cent of Japan's exports, including most of the cotton yarn, shirting, sheeting, paper tissues, and machinery. India took 6 per cent, including most of the silk goods, matches and glassware. France took 5 per cent, including the balance of the raw silk. Great Britain took 3 per cent.

In 1913 when exports were \$316,230,107, raw silk was 30 per cent, cotton yarn 11 per cent, cotton shirting and sheeting 2 per cent, cotton tissue 2 per cent, habutai 5 per cent, coal 3 per cent, potteries 1 per cent, refined sugar 2 per cent, tea 2 per cent, knitted goods 1 per cent, paper $\frac{1}{4}$ of 1 per cent, matches 2 per cent, machinery $\frac{1}{3}$ of 1 per cent, lumber 2 per cent, waste silk 2 per cent, glass $\frac{1}{2}$ of 1 per cent, and all others, $33\frac{1}{3}$ per cent.

In 1922, total imports were \$945,154,116, of which 23 per cent was raw cotton, 6 per cent machinery and parts, 5 per cent oil cake, 5 per cent lumber, 4 per cent iron plate, 4 per cent sugar, 4 per cent rice, 3 per cent wheat, 3 per cent wool, 3 per cent woolen tissues, 3 per cent woolen yarns, 2 per cent beans and peas, 2 per cent iron bars and rods, 1 per cent ingots and slabs, 1 per cent paper, 1 per cent kerosene, 1 per cent fresh eggs, 1 per cent flax hemp, jute and China grass, 1 per cent coal, 1 per cent mineral oils, and 26 per cent all others. The United States supplied Japan with 31 per cent of her imports, including 40 per cent of the raw cotton, 41 per cent of the machinery, 70 per cent of the lumber, 60 per cent of the iron bars, rods and plates, 80 per cent of the kerosene, 18 per cent of the paper. India supplied Japan with 14 per cent of her imports, including 49 per cent of the raw cotton and 28 per cent of the ingots and slabs. Great Britain supplied Japan with 13 per cent of her imports, including 37 per cent of the machinery, 15 per cent of the iron bars, etc., and most of her woolen tissues. China supplied Japan with 10 per cent of her imports, including 10 per cent of her raw cotton, 40 per cent of her ingots and slabs, and most of the eggs, China grass, and coal. Kwantung Leased Territory (in South Manchuria) supplied Japan with 8 per cent of her imports, including most of the wheat, beans, and peas. Germany supplied 6 per cent of Japan's imports, including chemicals and dyestuffs, and Australia supplied 4 per cent of Japan's imports, including most of the wool. In 1913, when imports were \$364,715,822 raw cotton accounted for 32 per cent, machinery and parts 5 per cent, oil cake 5 per cent, lumber $\frac{1}{4}$ of 1 per cent, iron plate 1 per cent, sugar 5 per cent, rice 7 per cent, wheat 2 per cent, wool 2 per cent, woolen tissues 2 per cent, woolen yarns 2 per cent, beans and peas 2 per cent, iron bars and rods 2 per cent, iron ingots and slabs 2 per cent, paper nil, kerosene oil 2 per cent, fresh eggs $\frac{1}{4}$ of 1 per cent, flax, hemp, jute and China grass 1 per cent, coal $\frac{2}{3}$ of 1 per cent and mineral oil negligible, with all others 28 per cent.

Finances. The total national debt increased from \$1,265,000,000 at the end of 1914 to \$1,861,000,000 at the end of 1922, the internal debt increasing from \$518,000,000 in 1914 to \$1,184,000,000 in 1922, while the foreign debt increased from \$647,000,000 in 1914 to \$677,000,000 in 1922. This increase during the War was necessitated by Japan's participation in the capture of Shantung from Germany in 1915 and the Siberian expedition with the Allies in 1917.

After the Armistice, \$55,500,000 of the foreign indebtedness was converted into internal debt. To offset her foreign indebtedness, Japan held \$307,500,000 in specie abroad in December, 1922, and held foreign government bonds of approximately \$222,500,000 as well as other investments abroad of \$400,000,000. In 1922, Japan imported about \$127,000,000 more in merchandise than she exported. To offset this, Japan's invisible balance of international payments was in her favor to the extent of \$121,000,000, leaving a net "unfavorable" balance of international payments against Japan for 1922 of \$6,000,000. These invisible items included the following to the credit of Japan, totaling \$298,500,000: government transactions, \$30,000,000; freight and charter income, \$95,000,000, expenditures of foreign shipping interests in Japan, \$10,000,000, expenditures of foreign tourists in Japan, \$16,000,000; remitted by Japanese business men and residents abroad, \$39,500,000; income from foreign investments, \$23,000,000; insurance and other premiums, \$30,000,000; French and British bonds payable, \$25,000,000; and other income, \$30,000,000. Offsetting these were the following to the debit of Japan, totaling \$178,000,000: interest on foreign bonds, \$49,000,000; payments by Foreign Office for consulates and embassies abroad, \$26,000,000; expenses of Japanese shipping companies abroad, \$32,500,000; expenditures of Japanese abroad, \$19,000,000; income of foreigners in Japan remitted abroad, \$6,500,000; insurance and other premiums, \$37,500,000; expenditures by Japanese business houses abroad, \$1,500,000; other expenditure, \$6,000,000.

Budget and National Wealth. In 1914-15, the annual budget showed a revenue of \$369,000,000 and expenditures of \$324,000,000, or a surplus of \$45,000,000. The budget for 1921-22 balanced at \$846,000,000, and that for 1922-23 at \$673,000,000, a reduction of \$173,000,000, chiefly due to decreased expenditures on the army and navy. The outstanding note issue of Japan on Aug 1, 1923, amounted to \$736,376,500 with gold holdings of the government and Bank of Japan on the same date of \$890,000,000. National wealth of Japan was estimated at from \$32,000,000,000 to \$49,000,000,000, or \$575 per capita. Per capita taxation had increased from \$2.55 in 1903-04 to \$4.30 in 1913-14 and to \$7.10 in 1919. After that, it dropped about 25 per cent (1923). The per capita national debt in 1903-04 was \$5.65, but in 1913-14, it totaled \$17.88, and in 1922, \$27.80.

Effects of the Earthquake. On Sept. 1, 1923, Japan was visited by one of the greatest catastrophes in history. An area 50 miles square was completely devastated by an earthquake and a much larger area severely affected; most of the buildings were injured or destroyed, and many were burned, while the rails on the railway were twisted and telephone and telegraph wires were thrown down. The total losses were officially estimated at from \$3,500,000,000 to \$5,000,000,000. They included the total destruction by fire of the City of Yokohama and the destruction of 70 per cent of Tokyo. Property in these cities insured to the extent of \$950,000,000 was a total loss to its owners because of the so-called "earthquake clause" in insurance contracts protecting the insurance company against "fire resulting from earthquake." It was estimated that 150,000 persons were killed by the quake and at least

half a million houses were burned and a like number wrecked. The chief economic result of the disaster was the necessity for Japan to find immediately large supplies of lumber, iron and steel, hardware and other construction materials abroad. In the four months after September, 1923, import statistics indicated a purchase of nearly \$150,000,000 of these materials. Early in 1924, Japan floated two new foreign loans, one for \$150,000,000 in the United States, with a share subscribed in dollars in Europe and one for £25,000,000 in England. All of the £25,000,000 loan and about \$60,000,000 of the dollar loan were to be set aside to take up two outstanding issues of 4½ per cent municipal bonds of the City of Tokyo coming due early in 1925. The gold holdings abroad of the government and the Bank of Japan on Jan. 15, 1924, were \$227,500,000, and this, together with about \$90,000,000 of the dollar loan, was to be used to finance purchases of raw materials for reconstruction. A reconstruction programme was adopted by the Japanese Diet in December, 1923, calling for expenditures for widening streets in Tokyo, providing for fire prevention zones, rebuilding walls, and paving streets. This was to cost \$350,000,000 covering a period of five years, or \$70,000,000 a year. A further expenditure of \$300,000,000 was decided upon by the cabinet in January, 1924, but was not voted by the Diet. This covered amounts to be spent for rebuilding government buildings, including arsenals. The earthquake also profoundly affected Japan's foreign policy, both economic and diplomatic. Money for the exploitation of Manchuria would not be available for some years, and the markets in China for Japanese cotton goods and in the United States for raw silk became such important factors in maintaining a volume of exports to counterbalance huge imports of reconstruction materials, that the good will of these markets had to be assiduously cultivated. The result was apparent, in 1924, in the studious forbearance from any action that might tend to affect good will toward Japan in either China or the United States. The fact that 65 per cent of Japan's exports were marketed in China and the United States and that in neither case were the commodities making up most of this amount of such a nature as to prove essential, or incapable of substitution in time of war or boycott, was a tremendous factor leading Japan, dominated by military clans, along the path of peaceful settlements.

Emigration Problem and Food Supply.

On the other hand, Japan's population was increasing at the rate of about 400,000 per annum while industrialization was not progressing sufficiently to take care of this surplus. The government was, therefore, faced with constant pressure in order to find sufficient food to take care of this increasing population. In 1924, Japan was already 10 per cent deficient in her production of the most important foodstuff, i.e. rice. The normal net excess of Japanese imports, visible and invisible, was represented by just about this necessary import of rice. If the population, which consumed this imported rice, could be allowed to emigrate each year, and the remaining population, by improved methods, could maintain the same production of rice, most of Japan's problems would be solved. However, most parts of the world to which Japanese cared to emigrate were shut off from

them. The Japanese is not a successful emigrant in countries of lower living standards than his own. In the 13 years that Japan held Korea and in the 20 years that it dominated South Manchuria, Japanese emigration to these regions was not successful, although fostered by every artificial inducement, including land grants, financial assistance in agriculture, etc. According to the *Japan Year Book* for 1923, Japanese formed less than 2 per cent of the population of Korea, or 367,618 inhabitants in 1921. In the same year there were only 82,145 Japanese in the Leased Territory of Liaotung, South Manchuria, as against 683,173 Chinese. See *BRITISH COLUMBIA; IMMIGRATION*.

Results of Disarmament Conference. As a result of the series of treaties and conventions concluded at Washington in 1922, Japan definitely agreed to a 5-3-3 ratio of capital ships with Great Britain and the United States. The result was a considerable curtailment in naval expenditure, without which Japan's financial position after the earthquake would have been much less strong than it was. The Four Power treaty, replacing the Anglo-Japanese Alliance (q.v.), jointly guaranteed Japan in her insular possessions in the Pacific Ocean and further reduced her need for expensive fortifications of these possessions, including Karafuto, Formosa, the Pescadores, and the mandated islands of the Pacific. The Nine Power treaty guaranteeing and reaffirming the open door principle in China lessened Japan's fear of western aggression in that country. Previously the open door principle had rested only upon an exchange of notes and the Anglo-Japanese Alliance. The Nine Power China Customs Treaty, when effectively carried out, should help to abolish troublesome interior taxes in China which tend to impede Japanese commerce in that country. It also provided China with increased revenue through which large sums owing to Japanese banks on which neither interest nor principal had been paid for five years might be refunded. Other resolutions regarding China and the Chinese Eastern Railway all affected Japan indirectly by working toward a minimizing of international friction in China and the necessity of Japan's maintaining large standing armies in her neighboring territories. Japan was, therefore, able to reduce her military expenditure proportionately with her naval expenditure, and per capita taxation was decreased. The military and naval appropriation for 1922-23 totaled \$343,331,000 or \$57,549,890 less than 1921-22. See *NAVIES OF THE WORLD*.

Conclusion. Japan made remarkable progress in adapting herself to Western conditions. In the short space of 56 years after the restoration of the Emperor to the power which had been usurped by the military leaders, Japan evolved from mediaeval to modern civilization with wonderful celerity and no grave economic or social disturbances. With industrialization, however, came a certain amount of social unrest, which was emphasized during the War by the creation of many new millionaires (*Norikin*) and a great influx of Russian refugees. The Japanese Army in Siberia also brought back the germ of communism and its influence spread with the difficult living conditions created by the earthquake. A number of Korean revolutionists, difficult to distinguish from Japanese, were believed to be fomenting unrest. The ever-present food shortage, the long hours, and

comparatively hard conditions in the factories to a people of agricultural traditions were all "leaven which leaveneth the whole." The most difficult years in the history of the empire were to be faced, in all likelihood, during the coming decade.

HISTORY

Domestic Affairs. Social unrest and the demand for constitutional government and democratic reform grew apace in Japan with the increasing modernization and industrialization of the country. This tendency became strongly manifest in the beginning of 1914, when there was widespread opposition to the proposed naval increases in the budget. Fuel was added to this dissatisfaction by the naval scandals of the spring of the same year which exposed the existence of wide corruption among high naval officials in connection with the award of contracts to English and German firms. In the face of the crisis resulting from these happenings, the Yamamoto government resigned on March 24. After prolonged difficulties a new cabinet, headed by Count Okuma, was formed on April 16, with a programme calling for economic reform, the elimination of corruption, and the establishment of true constitutionalism. A new crisis developed in December, 1914, when the Lower House by a majority of 65 rejected the army increases which under the influence of the events of the War had been incorporated in the budget for 1915. By Imperial Decree, the Lower House was dissolved and new elections were called for March of the following year. In the elections the ministerial party won a complete victory and the obvious consequence of this was the adoption of the previously rejected budget for national defense by a handsome majority. Thereupon the opposition resorted to different tactics and attempted to break the government by a vigorous attack upon its Chinese policy. On the failure of this move, recourse was had to charges of corruption. Subsequent revelations which substantiated some of these charges and in particular brought to light the bribing of deputies by a member of the cabinet, forced, on July 30, 1924, the resignation of the Okuma government, but on the insistence of the Mikado, Count Okuma resumed office with a reconstructed cabinet. The opposition, however, did not let up in its assaults on the government until Count Okuma resigned definitely in the summer of 1916, ostensibly for reasons of health. The retiring premier designated as his successor Viscount Kato, the leader of the newly formed Kenseikai or Constitutional party which had a majority in the Diet. In opposition to this parliamentary procedure, the Genro or Elder Statesmen who wielded the real power in the Japanese Empire, brought about on Oct. 9, 1916, the appointment of Marshal Terauchi, Governor-General of Korea, who had the reputation of being an arch-militarist. This disregard of constitutional rule highly incensed the Diet, and the Kenseikai in particular, and a sharp opposition developed against the Terauchi government in consequence of which the Diet was dissolved early in 1917. The following elections, held on April 20, resulted in a victory for Marshal Terauchi and the military party.

The Terauchi government remained in undisputed power till the fall of the following year,

when, as a direct result of temporary economic distress, an explosion occurred which in many ways signified the evolution of a new Japan irreconcilably opposed to Terauchi and the party and spirit which he represented. Japan had enjoyed an era of great prosperity during the War. Manufacture of war materials for the belligerent nations had given a tremendous impetus to Japanese industry which in consequence had undergone a great expansion; but with increased industrial power there had also arrived more complicated social and industrial problems and an increased demand for democratic reform. When, therefore, the shortage and high price of rice, the chief food of the Japanese, caused great suffering among the common people, the forces which had been accumulating broke loose in a storm of serious internal disorders in the early fall of 1918. The famous "Rice Riots," in conjunction with widespread strikes and other manifestations of social and industrial unrest, brought about the fall of the Terauchi cabinet on Sept. 29, 1918. The appointment of Takashi Hara as prime minister was a concession to this new spirit. Hara was the first commoner to become chief of the cabinet and he was, moreover, the leader of the Seiyukai, the party which had for a long time opposed the war policy and the Siberian policy of the Japanese government. The same year, 1918, had seen already in March, as a result of the wide popular demand for democratic reform, an extension of the franchise whereby the property qualifications for voting were lowered and the number of voters was increased from 1,500,000 to 3,000,000. Since this latter figure represented, however, only one-twentieth of the total population of Japan, this measure failed to satisfy the people, who in the early part of the following year renewed their loud demands for universal suffrage. Members of the educated classes actively agitated toward this end. Contrary to the usage of previous Japanese governments, the Hara ministry showed remarkable clemency in dealing with mass meetings and other demonstrations. In 1919, the Hara government expressed its willingness to take steps for the extension of the suffrage, but when the opposition at the beginning of 1920 introduced bills aiming at the adoption of universal suffrage the government opposed these on the ground that the time for such action had not yet arrived. On February 26, when the bills were up for final consideration, the Prime Minister declared that it was doubtful whether the majority of the people desired universal suffrage and thereupon announced the dissolution of the Diet by Imperial Decree. In the elections of May, 1920, the Seiyukai, the government party, was victorious and obtained 280 seats against 199, 39, and 29 for the three opposition parties. Notwithstanding the government's victory, however, and the vote of confidence given to the government on the question of national defense in February, 1921, active agitation for universal suffrage continued throughout the country.

On Nov. 24, 1921, the Crown Prince Hirohito was appointed regent, the Emperor Yoshihito having been long incapacitated by illness. The Regent was born in April, 1901, had been proclaimed Heir Apparent in 1912 on the accession of his father to the throne, and had been consecrated Crown Prince in 1916. Already, in May, 1920, his father had handed over to him

certain functions and had sent him on a mission to Europe.

After holding office for three years, Prime Minister Hara was assassinated on Nov. 4, 1921, at a time when the Washington Conference was about to begin and problems of the utmost importance for Japan were pending. A new ministry was formed by Baron Takahashi, who had been minister of finance in the Hara cabinet and who continued in substance the policy of his predecessor. Lack of harmony among the ministers brought about the early fall of the Takahashi cabinet in June, 1922. Thereupon Admiral Tomosaburo Kato, a member of the Liberal party and an opponent of the militarists, agreed to head a new government, constituted on a non-partisan basis, on the condition that the army leaders submit to a reduction of the army budget by 40,000,000 yen. After some minor reductions before that time, the government took final steps on Nov. 25, 1922, for the retirement of 60,000 men and an annual saving of the before-mentioned sum. At the same time, Japan, having ratified the Washington Treaties on July 6 of the same year, reduced its naval budget on assurance from the United States government that its own naval budget would be framed in accordance with the treaties of the Washington Conference. In pursuance of this policy of retrenchment, further substantial economies in connection with military and naval expenditures were made in the budget for 1923-24. An important forward step in juridical reform was a measure for the introduction of the jury system. The bill was laid before the Lower House on Feb. 10, 1923, and passed the Upper House on March 10. Its provisions were to go into effect in 1928. On August 28, Admiral Baron Kato died and it devolved upon Foreign Minister Count Uchida to conduct the government as prime minister, ad interim. Count Yamamoto undertook immediately the formation of a new cabinet and he was still engaged upon this task when Tokyo and surroundings were visited, on Sept. 1, 1923, by one of the most disastrous earthquakes in the history of the country.

The earthquake affected an area measuring some 80 miles deep by 120 miles wide. The destruction in life and property was terrific. Yokohama was practically wiped out by the disaster and Tokyo was partially destroyed. The toll in killed and missing amounted to nearly 150,000 lives. The government which at the time was in process of formation, and which held its first meeting in the open air amid smoking ruins, faced now the vast problem of reconstruction. But people and officials alike put themselves to the task and in a surprisingly short time reconstruction was begun. The whole nation, from the Imperial Family down to the last laborer, rallied heroically to the assistance of the government and by generous contributions helped in allaying misery and repairing the losses. Relief poured in from all parts of the world, especially from the United States. The Capital Restoration Council and the Restoration Board, established by an imperial edict, took under consideration immediately plans for the rebuilding of the destroyed cities on a greater and more modern scale. The supplementary estimates, amounting to 468,438,849 yen, for the preliminary work of reconstruction for the period 1923-29, were passed by the Diet, as was also a bill concerning the organiza-

tion and procedure for town planning in Tokyo and Yokohama. The plans for rebuilding these cities were drawn up with the assistance of the American expert, Dr. Charles A. Beard, who came to Japan for this special purpose by invitation of Minister Baron Goto. In a statement to the Diet, the Minister of Finance estimated the damage caused by the earthquake at between seven and ten billion yen.

On Dec. 27, 1923, an unsuccessful attempt was made on the life of the Prince Regent as he was on his way to the Diet to deliver the speech from the throne. Since no such attack on the Imperial House had occurred in modern times the entire ministry felt compelled in consequence to hand in its resignation. The Prince Regent refused to accept it, but the cabinet persisted and its resignation was finally accepted on Dec. 29, 1923. The position of the Yamamoto government had been precarious for some time, due to the opposition of the Seiyukai. A new cabinet, formed by Viscount Kiyoura on a non-partisan basis, came into office on Jan. 1, 1924. It received little support in the Diet and its early fall would have been certain, had not a split occurred in the Seiyukai and had not the seceding group, which adopted the name of Seiyu-honto or Original Constitutional party, and mustered 148 votes in the Lower House, thrown its support to the Kiyoura cabinet. As a result of the attempted wrecking of a railroad train which had three opposition leaders aboard, a storm broke loose in the Diet which led to the dissolution of the Diet on Jan. 31, 1924.

The first loan placed by Japan on the American market since the Russo-Japanese War was offered on February 11. The American share of this loan was to be \$150,000,000 and another section offered to the English public amounted to £25,000,000. Both issues were greatly oversubscribed. The proceeds of the American and English shares of this loan were intended to be used for the retirement of the remainder of sterling 4½ per cent bonds and the balance was to be applied to the financing of reconstruction measures growing out of the earthquake disaster, the total cost of which was placed at approximately \$700,000,000.

Elections for the Lower House were held on May 10 and resulted in the defeat of the Seiyu-honto, the newly-formed party supporting Premier Kiyoura. The returns were reported as follows: Kenseikai 146, Seiyu-honto 120, Seiyukai 101, Kakushin Club 30, Businessmen's party 8, Independents 57. An outstanding feature of the election was the defeat of many members of the previous Parliament and the return of 250 deputies without parliamentary experience. The resignation of the Kiyoura cabinet, necessitated by the adverse vote, was postponed until after the celebration of the wedding of the Prince Regent on June 5. Since no party commanded a majority in the Diet, Viscount Kato formed subsequently a coalition cabinet which represented the Kenseikai, the Seiyukai and the Kakushin Club.

The new American immigration policy and the discrimination against Japanese resulting therefrom aroused a storm of indignation in Japan. Protest meetings were held, five Japanese patriots committed hara-kiri in protest, and the anti-exclusion organization, called the "Kokumin Taibeikai," was formed. A boycott of American moving picture films, which had been

instituted in retaliation, had to be subsequently abandoned as a failure. On the whole, the American measures had the effect of creating a wave of anti-American feeling in Japan which the government strove earnestly to keep within bounds so as to prevent any untoward incidents which might further strain Japanese-American relations. Japanese indignation was not so much aroused by the general exclusion policy of the United States as by the special discrimination between Japanese and other aliens and by the placing of members of the proud Japanese nation on the same level with other Asiatics whose governments did not sit at the council table of the great powers of the world. The feeling of friendship and gratitude generated by American generosity on occasion of the earthquake was seriously impaired by the policy of the United States. While the Immigration Bill was under consideration the Japanese government took steps to bring about, and actually effected in July, 1924, a change in the laws of citizenship whereby the "dual citizenship" was abolished and Japanese nationals would henceforth lose their Japanese citizenship upon naturalization in another country.

Foreign Policy. In 1914, before the outbreak of the War, Japan was confronted with two great international problems, the effects of the unsettled conditions in China on Sino-Japanese relations and the difficulties with the United States arising from the treatment of Japanese citizens on the American Pacific Coast. The outbreak of the War pushed these issues temporarily into the background and supplied the astute statesmen of Japan with a great opportunity for which they had been patiently waiting for a long time. Within a fortnight after the commencement of hostilities between Great Britain and Germany, Japan delivered an ultimatum to the latter demanding the immediate withdrawal of all German warships from Chinese and Japanese waters and the surrender of Kiaochow to Japan, with a view to the eventual return of this territory to China. A week later, Japan declared war on Germany and on Nov. 7, 1914, the German force at Tsingtao capitulated to the Japanese Expeditionary Force. Already, during the previous month, Japan had occupied the Marianne, Caroline, and Marshall Islands in the Pacific. The rapidity of this move came rather as a surprise to the Germans, and even to other nations, in view of the well-known German sympathies in certain influential Japanese circles. As its reason for entering the War, the Japanese government cited its treaty obligations with Great Britain. (See *ANGLO-JAPANESE ALLIANCE*.) A more convincing reason, however, was the Japanese desire to dislodge a western power from a position that was dangerous to Japanese hegemony in the Far East. Ever since 1895, when the combined action of Russia, Germany, and France compelled Japan to forego part of the spoils of the war with China, guaranteed to her by the Treaty of Shimonoseki, she had been biding her time. In the case of Russia, the opportunity had come with the Russo-Japanese War, and the outbreak of the European conflagration presented now the occasion to hold a reckoning with Germany. Behind the screen of the Anglo-Japanese Alliance, Japan used the preoccupation of the Western Powers in Europe to establish herself in a practically impregnable position in the Far East. No doubt Japan fulfilled faithfully the

obligations arising out of the Anglo-Japanese Alliance, helped in removing all vestiges of German power from the Pacific, and even sent a naval squadron to the Mediterranean for convoy duty; but with much more faithfulness did she apply herself to the task of emerging from the War as the Power in the Far East, and of using her position of economic vantage as best she could, with the result that the close of the War found her financially in excellent condition and industrially greatly developed. See *WAB, DIPLOMACY OF THE*.

Ostensibly, Japan had seized Kiaochow to restore it eventually to China. This pious intention harmonized ill with the fact that before the dispatch of the Japanese ultimatum to Germany negotiations had been going on between Germany and China looking toward the voluntary return by the former to the latter of the Kiaochow Leased Territory. When therefore, on Jan. 18, 1915, Japan retaliated to the Chinese demand for the restoration of the territory by presenting to the Chinese government in a peremptory manner the well-known Twenty-one Demands, this move came rather as a surprise and aroused the suspicion even of Japan's allies. After some resistance, the Chinese government, in the face of a Japanese Note with a time limit, signed the *Japano-Chinese Treaties and Agreements* of May 25, 1915, which embodied 15 of the original Twenty-one Demands. In the meantime, Japan increased constantly her military forces in Chinese territory. These flagrant encroachments of Japan on Chinese territory and sovereignty could hardly be reconciled with her previous declarations of concern for China's welfare and the absence of any aggressive intentions.

Following the Treaty of Portsmouth, there had been a rapprochement between Japan and Russia, in the course of which four secret treaties, the last one in 1916, had been concluded between the two powers (see *SIBERIA* and the *FAR EASTERN REPUBLIC*). The last of these secret treaties, which practically amounted to an alliance in Far Eastern affairs between the former enemies, stated that the "vital interests" of the contracting parties required the "safeguarding of China from the political domination of any third power whatever having hostile designs against Russia and Japan." This potentially significant Russo-Japanese policy was ill-fated, however, for the Russian Revolution annulled all treaties and agreements entered into by Imperial Russia, and left Japan with new problems on her hands, but at the same time delivered her also from her most formidable rival.

A Special Japanese Mission to the United States concluded, in the autumn of 1917, a convention with the American government, commonly known as the *Lansing-Ishii Agreement*. By this document, the liberty of action of Japan in China was further extended, inasmuch as the United States, the only power that was free to interfere with Japanese plans in the Far East, recognized the special interests of Japan in China arising out of territorial proximity. The Japanese further consolidated their position in China by the secret military *Sino-Japanese Agreement* of May, 1918, which provided for common defense of mutual interests in China against Soviet Russia for the duration of the War, and by the secret agreements of Sept. 24, 1918, which granted Japan

far-reaching railroad concessions in China. These agreements, which were not disclosed officially to the other Allied Powers until after the opening of the Peace Conference, caused great resentment in China when they became public and proved also injurious to the Chinese claims at the Peace Conference. Of far greater significance, however, were the secret agreements concluded between Japan and the Allies early in 1917, whereby the British, French, Russian, and Italian governments, which were at that time greatly in need of Japanese naval assistance, pledged themselves more or less unconditionally to support at the Peace Conference the Japanese claims with regard to the disposal of the former German rights in Shantung and the Pacific islands north of the Equator (see SHANTUNG).

The military collapse of Russia and the Russian Revolution not only delivered Japan from her greatest rival in the Far East, but also gave her an opportunity to pursue a policy of her own with regard to Siberia. Already early in 1918, Japan had landed troops in Vladivostok for the protection of Japanese nationals and interests. In the subsequent Allied Intervention in Siberia during the fall of 1918, Japan was an active participant, but at no time did she manifest any genuine concern for the establishment of a strong and stable anti-Bolshevik government. In fact, she refused to extend her intervention to the region east of Lake Baikal where she had no special interest. At the same time, there was strong evidence of Japanese underhand dealings with such semi-independent Cossack leaders and notorious brigands as Semenov and Kalmikov who were far more of a liability than an asset to the White Russian movement and served to further materially the designs of Japan in Siberia. Thus Japan, by her policy of obstruction, seems to have contributed materially to the final collapse of the anti-Bolshevik government and to the failure of Allied Intervention in Siberia (see SIBERIA and the FAR EASTERN REPUBLIC).

At the Peace Conference, Japan was represented by a strong delegation headed by Marquis Saionji. The Japanese representatives took part in all the important sessions on a footing of equality with those of Great Britain, France, Italy, and the United States; and Japan was one of the powers which formed the all-powerful Council of Ten. The Japanese delegates presented two separate claims. Of these, the demand for the recognition of racial equality met with strong opposition, primarily on the part of the United States, and hence was eventually rejected (see PEACE CONFERENCE). Japan was more successful in her claims with regard to Shantung and the former German islands in the Pacific north of the Equator. The arguments advanced by the head of the Japanese delegation in favor of retention of these territories were in substance as follows: Japan had taken these places from Germany during the War in fulfillment of her treaty obligations; she held them in occupation at the time; they should form Japan's just compensation for her contribution to the Allied victory. After much delay and discussion, the former German rights in Shantung were finally awarded to Japan on Apr. 30, 1919. The withdrawal of Italy from the Conference had given Japan an opportunity to threaten with a refusal to sign the Peace Treaty unless her claims with regard

to Shantung were favorably considered. It was then that Messrs. Clemenceau and Lloyd George voted in accordance with the pledges given to Japan in the secret agreements of February and March, 1917, and thus overrode the opposition of President Wilson, who claimed to be ignorant of these understandings (see PEACE CONFERENCE; also SHANTUNG). On May 7, 1919, the Council awarded to Japan the islands in the Pacific north of the Equator to be administered under the mandatory system. The Japanese sovereignty over the Island of Yap, contained within this group, was disputed by the United States, which based its objection on the ground that it had never ratified the Peace Treaty of Versailles. A final adjustment of the matter took place at the Washington Conference at the end of 1921, in the form of an agreement whereby the United States recognized Japanese sovereignty over Yap and was accorded in return full rights and facilities in connection with the cables and other matters (see YAP and also WASHINGTON CONFERENCE).

The allocation of German rights in Shantung to Japan caused a storm of protest in China and general indignation throughout the world. There was universal apprehension at the way in which Japan within recent years had surged to the fore as a first-class power. The close of the War found Japan, as a result of astute statesmanship during the conflict, to have obtained a more or less firm grip on a vast territory in the Far East, comprising Eastern Siberia, Sakhalin, Kamchatka, Manchuria, Inner Mongolia, and Shantung. Post-war history marks the gradual retreat of Japan from some of these territories, partly as a result of international public opinion and of pressure from the other powers, which were free now to devote more attention to Far Eastern affairs, and partly as a result of re-orientation of Japanese foreign policy due to the exigencies of world affairs. On May 7, 1920, Japan announced her readiness to withdraw her reservations in Manchuria and Mongolia. By this concession the territories in question came under the authority of the Chinese Loan Consortium, consisting of American, British, French, and Japanese banking groups. Far greater difficulties were encountered in the settlement of the Shantung problem. Repeated attempts of Japan to negotiate with Peking over the Shantung issue were blocked by the steadfast refusal of China, which insisted that any agreement must be preceded by the restoration to China of the territory and the rights connected therewith. Japanese proposals on Sept. 7, 1921, before the meeting of the Disarmament Conference in Washington, involved the restoration to China of the Leased Territory of Kiaochow, in return for which the territory was to be opened to foreign trade and Japan was to receive certain railway and mining concessions. These rather moderate proposals were rejected by China. A final agreement was reached at the Washington Conference in the form of a treaty signed between Japan and China on Feb. 7, 1922, which provided for the immediate transfer of the former German port and concessions to China and for the payment of a monetary compensation and the grant of certain rights to Japan (see SHANTUNG; also WASHINGTON CONFERENCE). At the same time Japan, by affixing her signature to the Treaty of the Open Door in China, relinquished other reservations in China, but

refused to abandon her hold on Manchuria and Mongolia (see WASHINGTON CONFERENCE). On May 10, 1923, the Chinese government addressed a Note to Tokyo in which the desire was expressed to open negotiations relative to the abrogation of the Sino-Japanese Treaties and Agreements of May 25, 1915. The Japanese reply bluntly rejected this request and made clear at the same time that Japan did not regard these treaties as susceptible of modification.

In spite of solemn declarations and promises, Japan did not participate in the withdrawal of the Allied Expeditionary Force in Siberia after the Kolchak débacle early in 1920. Instead she consolidated her position in the region east of Lake Baikal, testifying thereby that her policy in the Russian Far East was dictated by special interests arising out of geographical propinquity. The Japanese Siberian policy aroused the suspicion of the other powers and caused representations to be made by the United States to the Tokyo government. Partly in consequence thereof, but chiefly as a result of the progress of Soviet power in Siberia and the stabilization of eastern Siberian affairs under the Far Eastern Republic, which had been established in Chita after the collapse of the White Russian movement, the Japanese slowly retraced their steps in the following years and withdrew their troops to the Maritime Province and to Vladivostok where an anti-Bolshevik government held sway as a powerless instrument of Japanese policy. At the same time, however, Japan extended her occupation to Northern or Russian Sakhalin in retaliation for the Nicolai-evsk Massacre early in 1920. In the face of the steadily growing power of the Soviets in Siberia, Japan began subsequently to prepare for total evacuation. A conference between the Japanese and representatives of the Far Eastern Republic at Dairen, which lasted from fall, 1921, to spring, 1922, ended in failure. Shortly afterwards Japan announced her intention to withdraw all troops from the mainland of Siberia by the end of October, 1922. The reasons for this move must be sought in the results of the Washington Conference and in the strengthening of Soviet rule. While the evacuation was in progress, another conference took place in September, 1922, at Changchun in Manchuria between representatives of Japan and the Far Eastern Republic, in which also emissaries from Moscow participated. This conference broke up because of Japan's refusal to evacuate Northern Sakhalin and to recognize the Soviet government. The Japanese Russian policy underwent some modification, however, with the absorption of the Chita government by the Soviets immediately after the Japanese evacuation and with Soviet possession of the entire mainland of Siberia. At the same time, the Soviet government began to adopt various aspects of the Czarist Far Eastern policy and above all came to evolve a definite Chinese policy, especially with regard to Mongolia. Thereafter signs began to appear that Moscow and Tokyo were seeking a *modus vivendi*. Thus the year 1923 was taken up with private and semi-official conferences between high Russian and Japanese officials looking toward the conclusion of a Russo-Japanese commercial treaty, the recognition of the Soviet government by Japan, and the evacuation of Northern Sakhalin. Negotiations progressed only very slowly, the chief stumbling block being the Sakhalin

issue. On July 24, 1924, the Japanese cabinet adopted a plan submitted by Foreign Minister Shidehara which would form the basis for an understanding with Soviet Russia, as worked out in protracted negotiations between the Japanese and Russian envoys in Peking. The chief points were reported to be as follows: (1) Cession by Russia to Japan of mining and oil concessions in Northern Sakhalin; (2) a Russian apology to Japan for the Nicolaievsk Massacre; (3) withdrawal of Japanese troops from Northern Sakhalin; (4) recognition by Russia of the Portsmouth Treaty; resumption of Russian-Japanese diplomatic relations. Finally persistent rumors were current in the summer of 1924 that Russia and Japan had reached a secret agreement providing for coöperation of the two countries in Far Eastern affairs to the exclusion of the interests of any third power. If substantiated this would mean the final adoption by Soviet Russia of the Far Eastern policy of the Czar and would be, in connection with the recent American immigration policy, of tremendous significance in future Japanese foreign policy, particularly with relation to the United States. For Japan's Siberian policy, see SIBERIA and the FAR EASTERN REPUBLIC.

Japan was one of the chief participants in the Washington Conference, Nov. 12, 1921-Feb. 6, 1922, in which agreements of outstanding importance to Japan were arrived at. The treaties and agreements affecting Japan, aside from those specifically relating to China—such as the Shantung agreement, the Nine Power Treaty of the Open Door in China, the treaty pertaining to the Chinese tariff, the agreement relative to the withdrawal of foreign control of post offices in China—were the Four Power Treaty, dealing with the problems of the Pacific; the Five Power Naval Treaty, and the agreement between the United States and Japan relating to the status of the island of Yap. The Four Power Treaty aimed at the settlement of problems arising out of Japan's need for expansion in the Pacific by an agreement between the contracting powers for the mutual protection of island possessions and dominions in the Pacific. The Five Power Treaty provided for naval limitation on the basis of the 5-5-3 naval ratio, Japan limiting herself thereby to the maximum of 10 capital ships of 312,700 tons as against 20 of 582,540 tons for Great Britain and 18 of 525,850 tons for the United States. On the part of Japan, these treaties represent a sincere effort at an amicable understanding with the view to preventing questions arising out of Japan's astonishing growth as a power within the last 10 years from developing into armed conflict. A further manifestation of this spirit was the faithful carrying out of the Washington agreements and the adoption by the Japanese government of a policy of military and naval retrenchment. A direct result of the Washington Conference was the cancellation of the Lansing-Ishii Agreement in March, 1922, because in view of the Nine Power Treaty a new understanding had become possible. By the Four Power Treaty the Anglo-Japanese Alliance was definitely superseded. (See ANGLO-JAPANESE ALLIANCE.) Subsequently there occurred in Great Britain much criticism of Japan and apprehension at the growing power of that country in the Far East. Concentration of British naval units in the Pacific and the drafting of a plan for a naval base at Singa-

pore caused increased watchfulness on the part of Japan.

Perhaps the most serious factor in Japanese foreign relations was the status of Japanese in the United States and especially their treatment in the Pacific States. Difficulties arising therefrom had been to some extent regulated by the gentlemen's agreement concluded between Japan and the United States. After a comparative lull in the situation due to the exigencies of the War, new friction arose in 1920 with the passage by California on November 2 of an act by which "ineligible aliens" forfeited all rights of holding land in that State. This was followed by anti-alien land legislation in other Western States, with the Washington Conference, the generous extension of aid to Japan by the United States on the occasion of the great earthquake, in 1923, and the manifestation of sincere gratitude on the part of the Japanese government and people, an era of better understanding between the two countries seemed to be approaching. But whatever ground for hope in that direction might have existed was hopelessly blighted by decisions of the United States Supreme Court on Nov. 12 and 19, 1923, sustaining in full the alien land laws of California and Washington. Much more serious, however, was the effect of the new American immigration law, effective July 1, 1924, which carried a Japanese exclusion clause and amounted to an abrogation of the "gentlemen's agreement." This measure caused a storm of indignation in Japan. The Japanese government, however, proceeded with caution and did everything in its power to avoid cause for conflict. It prevented too extreme expression of public indignation and took steps to abolish "dual nationality." On April 10, Masanao Hanihara (q.v.), Japanese Ambassador in Washington, wrote a letter to Mr. Hughes in which he referred to the "grave consequences which the enactment of the measure" would inevitably bring upon the otherwise happy and mutually advantageous relations between the two countries. This statement provoked hostile criticism in the United States. On May 31 the Japanese Ambassador presented a lengthy note of protest of his government to the American government. Secretary Hughes's reply was well received in Japan but failed to satisfy public opinion. The departure of the Japanese Ambassador to Japan on June 11 was interpreted in many circles as a direct result of the Immigration Bill. Whatever right the United States might possess to pursue such a policy and whatever merits the bill has from the standpoint of American domestic policy, there can be no doubt that the new policy has seriously impaired the beneficial results of the Disarmament Conference, in spite of the fact that the Japanese government preserves a very calm front. It is significant that the Japanese Minister of the Navy declared on July 7 in the Diet that a decided expansion of the Japanese naval air forces, "necessitated by recent developments at home and abroad," was contemplated. Japan also resumed, in July, 1924, negotiations with Soviet Russia toward a closer understanding.

JAPANESE BEETLE. See ENTOMOLOGY, ECONOMIC.

JARDINE, WILLIAM M. (1879-). An American agronomist, born in Oneida County, Idaho. He graduated from the Agricultural College of Utah in 1904 and took postgraduate

studies at the University of Illinois. In 1904, he was appointed assistant in agronomy at the Agricultural College of Utah, and became professor in 1905-06. He was agronomist at the Kansas State Agricultural College and Experiment Station in 1910, and in 1913 was acting director of the Experiment Station and dean of agriculture at the Kansas State Agricultural College. Professor Jardine was director and dean of agriculture at this university from 1913 to 1918, and in the latter year was chosen its president. He was a member of many agricultural societies and wrote numerous papers and bulletins on dry farming and crop production.

JASTROW, IGNAZ (1856-). A professor of the science of government at the University of Berlin (see VOL. XII). His works after the War deal mainly with economic problems. They include: *Kriegszustand* (1914); *Mitteuropäische Zollannäherung und Meistbegünstigung* (1915); *Geld und Kredit im Kriege* (1915); *Die Handelspolitische Zukunft Deutschlands* (1917); *Volkerreichtum und Wirtschaftskrise* (1917); *Volksvermögen im Kriege* (1920); *Reform der staatswissenschaftlichen Studien* (1924).

JASTROW, JOSEPH (1863-). An American psychologist (see VOL. XII). His later work comprises analytic studies of the sentiments and higher mental complexes. His published works include *Character and Temperament* (1915) and *The Psychology of Conviction* (1918).

JASTROW, MORRIS, JR. (1861-1921). An American philologist and Orientalist, (see VOL. XII). His last published works are: *The Civil Law of Babylonia and Assyria* (1915); *The War and the Bagdad Railroad* (1917); *The War and the Coming Peace* (1918); *A Gentle Cynic*, an abbreviated translation of the Book of Koholeth or Ecclesiastes (1919), and *The Eastern Question and its Solution* (1920).

JAVA. See DUTCH EAST INDIES.

JAY, PETER AUGUSTUS (1877-). An American diplomat, born in Newport, R. I. He was graduated from Harvard College in 1900 and in 1902 entered the diplomatic service as third secretary of the American Embassy in Paris. He served as secretary at several embassies, including Constantinople and Tokyo. From 1909 to 1913, he was diplomatic agent and consul-general at Cairo. He served as secretary of the American Embassy in Italy in 1913, and at the same time was counselor at that embassy. He was minister at Salvador in 1920, and in 1921 was minister to Rumania.

JAZZ. Immediately after the close of the War, a new kind of popular music made its appearance in the United States and at once attained enormous vogue, taking complete possession of the dance halls, the theatres, the movies and the hotels. Jazz is a natural development of the older rag-time, which finally became transformed through the amalgamation of various elements. During the War the soldiers amused themselves by doing "stunts" on their musical instruments. Some one discovered that very funny effects could be produced by laughing, catcalling, wailing or uttering short exclamations through brass instruments. After their return to civilian life, these ex-soldiers introduced these stunts into the dance orchestras. The circus bands contributed their weird imitations of oriental music. Real oriental ef-

fects were contributed by musicians who had played in orchestras in San Francisco and other Western cities. The influence of the Negro melodies of the South also is very noticeable. Even Futurism is responsible for some queer harmonic combinations, although this influence is rather casual and slight, for jazz still respects the fundamental laws of harmony and moves within the limitations of a fixed tonality. Some attempts have been made to trace the origin of jazz to African tunes. Comparison, however, at once establishes the fact that the aboriginal African melodies are characterized by the absence of any regular periodic structure and the presence of several cross-rhythms, whereas jazz clings to regular four or eight bar periods supported upon one predominating rhythm. The first jazz compositions, which appeared in 1919, were crude enough; in fact, little more than degenerate ragtime. This is not surprising, when one considers that these pioneers were men who elaborated their tunes by ear on the piano and required the aid of some musician to fix them in musical notation. As these tunes quickly superseded, and even drove out the older dances, the dance orchestras naturally became the principal factor in the development of jazz. To remedy to some extent the crudities of the printed score, embellishments of various kinds were introduced *ad libitum* (vulgarily called "libbin'") during actual performance. The conductors soon began to realize the necessity of reducing to a system this free improvisation by a number of players, if the performance was not to degenerate into chaotic noise. Thus there sprang up a group of regular arrangers, skilled musicians, able to recognize the possibilities of certain jazz tunes and capable of altering, harmonizing and embellishing them so as to render them acceptable to the popular ear. From this point on it was the arranger, rather than the composer, who became the important factor in the development of jazz. Effective orchestral coloring became a prime consideration, and this brought about a radical revolution in the constitution of the former monotonous dance orchestra, so that the jazz band is capable of a considerable variety of tonal effects. The average combination of instruments for a small band is a piano, two or three saxophones (the typical jazz instrument), a violin, two trumpets, a trombone, a tuba, a banjo and drums. Finally large symphonic jazz orchestras were formed which consisted of the almost complete classical symphony orchestra with the addition of the indispensable saxophones. Paul Whiteman with his jazz orchestra made a most successful tour of Europe, and in 1924 gave at Carnegie Hall, in New York, a concert that was attended by many serious musicians. Briefly, jazz may be described as light music with melodious themes elaborately embellished and adapted to some popular dance rhythm. A very common practice is to give the principal theme to the violin, against which the saxophone executes a melodious counterpoint which often attains the importance of a counter-theme. Several arrangers have not hesitated to jazz themes of famous composers (Beethoven, Wagner, Schubert, Saint-Saëns, etc.). A special form of jazz, which had its origin in Memphis, is the "Blues," so-called from the fact that the music illustrates a text describing some melancholy tale of disappointed love. On

the musical side this form derives directly from the Negro spirituals, and its special characteristic is a triplet appoggiatura before the bass note of the principal accent in each measure. As to the origin of the word "jazz," the following story is current: In Memphis, a dusky trio consisting of a singer, a banjo player and a performer on a tin can became locally known as the Jackass Band, which was jocularly transposed to Jassack's or Jazzack's Band; whence the abbreviation Jazz.

JEBEL SHAMMAR. See ARABIA.

JELlicoe, JOHN RUSHWORTH, first Viscount of SCAPA (1859-). An English naval officer (see VOL. XII). Shortly after the outbreak of the War he was placed in command of the Grand Fleet, and in 1915 he was created a full admiral. In this capacity he was in supreme command of the British Fleet at the Battle of Jutland. In November, 1916, he was succeeded as commander of the fleet by Admiral Beatty, and was appointed first sea lord of the admiralty. He established the antisubmarine division of the Navy Staff. In May, 1917, he was appointed chief of the Naval Staff, and retired in December, 1917. He was raised to the peerage. He wrote *The Grand Fleet, 1914-16; its Creation, Development, and Work*, and *The Crisis of the Naval War*.

JELLiffe, SMITH ELY (1866-). (See VOL. XII). In addition to editorial supervision of the *New York Medical Journal*, *Journal of Nervous and Mental Diseases* and *Psychoanalytic Review*, and of translations and new editions of books on psychiatry, etc., Dr. Jelliffe collaborated with Dr. W. A. White in the preparation of a very successful textbook, *Diseases of the Nervous System* (1915).

JELLINEK, KARL W. K. (1882-). An Austrian professor of chemistry, professor of analytical chemistry at Danzig. He is the author of textbooks on analytical chemistry, of *Weltengeheimnis*, a work on the harmonious union of philosophy, art and religion (1920) and *Weltatiker und Relativtheorie* (1922).

JENKINS, BURRIS ATKINS (1869-). An American clergyman and educator, born in Kansas City, Mo. He was graduated from Bethany College in 1891 and took postgraduate courses at Harvard. He was ordained to the Christian (Disciples) ministry and was pastor in Indianapolis from 1896 to 1900. From 1898 to 1900, he was professor of New Testament literature and exegesis at the University of Minneapolis, and was president of that institution from 1899 to 1900. He was president of Kentucky University from 1901 to 1907, and from the latter date was pastor in Kansas City. From 1919, he was editor and publisher of the *Kansas City Post*. He wrote *The Man in the Street and Religion* (1917); *It Happened Over There* (1918); *The Brace-Girdle* (1922).

JENKS, ALBERT EDWARD (1869-). An American anthropologist. He was born in Ionia, Mich., and studied at the University of Michigan. He is a valued contributor to anthropological and ethnological magazines and has published, among other works, *Indian-White Amalgamation: an Anthropometric Study* (1916).

JENKS, JEREMIAH WHIPPLE (1856-). An American economist and educator (see VOL. XII). In 1916, he served as one of two neutral arbitrators on the board of six, between the

Switchmen's Union of North America and certain railways. He was director of the Far Eastern Bureau from 1913 to 1921. During the War he acted as a member of the Advisory Commission of the Council of National Defense, and in several other important capacities. His later books include *Business and Government* (1917); *Jesus' Principles of Living*, with C. F. Kent (1920); *Great American Issues*, with John Hays Hammond. He was a frequent contributor to periodicals on literary, economic and political questions.

JEPSON, WILLIS LINN (?-). An American botanist. He graduated from the University of California in 1889 and took post-graduate studies at Cornell and Harvard universities, and in England and Germany. He was appointed assistant in botany at the University of California in 1891, and was successively assistant professor, associate professor and professor, assuming the last office in 1919. He explored the remote mountain and desert regions of California and conducted botanic expeditions in Alaska and the Bering Sea. He was a member of many scientific societies and the author of: *Flora of Western Middle California* (1901); *The Trees of California* (1909); *The Silva of California* (1910).

JERITZA, MARIA (1893-). An Austrian dramatic soprano, born at Brünn. She attended the Musikschule there and studied singing privately with Professor Krejci, then continued her lessons with Professor Auspitzer for three years. After her debut as Elsa in *Lohengrin* at Olmutz, in 1910, she sang there for five months, when she was engaged for the Volksoper in Vienna, where she rapidly rose to prominence, so that Strauss chose her to create Ariadne in the world première of his *Ariadne auf Naxos* at Stuttgart (1912). In the same year, while still in her teens, she was engaged for leading rôles at the Vienna Hofoper, at first as guest, but from 1913 as regular member, after the Hofoper had paid the forfeit for her unexpired contract with the Volksoper. In 1917, she was made Kammersängerin, being the last artist on whom that title was bestowed. She created the principal rôles in most of the novelties produced at the Hofoper, which in 1919 became the Staatsoper. On Nov. 19, 1921, she made her American debut, with sensational success, at the Metropolitan Opera House as Marietta in the American première of Korngold's *Die tote Stadt*, establishing herself immediately as a prime favorite. While her voice is one of rare beauty and power, she fascinates her audience primarily through her unusual talent as an actress. Her repertory comprises more than 50 rôles.—Consult W. von Wymetal, *Maria Jeritza* (Vienna, 1922) and her autobiography, *Sunlight and Song: A Singer's Life* (New York, 1924).

JERSEY CITY. The second city of New Jersey in population and the chief seaport of the State. The population increased from 267,779 in 1910 to 298,113 in 1920. The estimated population in 1923 was 309,034. Jersey City is one of the most important manufacturing cities on the Atlantic coast. It forms part of New York harbor, and the improvements projected by the Port Authority in 1922-23 would, when carried out, result in much-needed improvements in dock and harbor facilities. During the War, the city was a shipping point of great importance, and its need of larger capacity in docks

was greatly emphasized in this period. During the decade 1914-24 many important municipal improvements were made. A large mileage of streets was repaved, and many miles of sewers were laid. One of the chief improvements was the construction and opening of Pershing Field, a great park and recreation centre embracing a large area of what was previously waste land. This was dedicated in 1920. The Health Department was especially active during the decade. Eight centres for the care of children were established, and the City Hospital was enlarged and made a Community Health Centre. Jersey City is an important industrial city. The number of establishments increased from 770 in 1909 to 896 in 1919, while the value of products increased from \$164,529,000 in 1914 to \$374,183,000 in 1919. The four leading products with their comparative values in 1914 and 1919 are as follows: slaughtering and meat packing, \$25,235,000 and \$78,226,000; foundry and machine shop products, \$4,650,000 and \$13,989,000; bread and bakery products, \$2,583,000 and \$12,201,000; cars and shop construction, \$1,560,000 and \$7,729,000.

JERUSALEM. See WAR IN EUROPE, *Turkish Front*.

JEWETT, FRANK BALDWIN (1879-). An American electrical engineer, born at Pasadena, Cal. He was graduated from Throop Polytechnic Institute in 1898, and then became a research assistant at the University of Chicago, receiving his Ph.D. there in 1902. During 1902-04 he was instructor of physics at the Massachusetts Institute of Technology, then entered the service of the American Telegraph and Telephone Company as transmission and protection engineer. In 1912, he joined the Western Electric Company of which he became chief engineer in 1914. During the War he was a lieutenant-colonel in the United States Signal Corps and also a member of various committees connected with the National Research Council, receiving in 1919 a Distinguished Service Medal.

JEWISH NATIONAL HOME. See PALESTINE.

JEWS AND JUDAISM. The decade 1914-24 brought a radical transformation in the position of Jewry throughout the world. The two chief gains resulting from the War were the recognition of the Jews as citizens in countries such as Russia, Poland, and Rumania, where they had hitherto been legally oppressed, and the creation of a national Jewish homeland in Palestine. On the other hand the distress and turmoil incidental to the War wrought great havoc among the communities of eastern Europe which had always contained a majority of the race and caused the destruction of much life and property. The situation of the Jews in the war areas of eastern Europe during the actual military operations was, from an economic and political standpoint, little less than desperate. The suffering in Galicia and Russian Poland in 1915 worked especial hardships on the Jewish populations of those regions. In the German capture of Warsaw alone, over 300,000 Jews were directly concerned, and the open country of Poland was almost entirely denuded of its Jewish population. The economic misery and commercial ruin continued in 1916 and was emphasized by the entrance of Rumania into the War and by the invasion of Bukovina and a greater part of Galicia by the Russians. In

Poland, under the new German régime, the Jews were given full civil rights, and educational and social conditions were greatly improved. In Russia also, they enjoyed a freedom which they had not hitherto known. In that country numerous schools were established for the children of refugees in interior cities. Further promise of better conditions in Russia accompanied the Russian Revolution, which emancipated 5,000,000 Jews within the boundaries of the Empire. The revolutionary government abolished all restrictions on Jews and granted them full liberty and equality. The Jews began at once to take an active part in the social and political activities of the new democracy, and new schools and colleges were established for the exclusive use of Jewish students.

The accession of the Bolsheviks to power modified in important ways the life of the Russian Jews. The programme of Communism as instituted by the more extreme leaders was ruthless toward private enterprise, and as the Jews were among the most active of the merchants and traders they suffered intensely under the new régime. The Bolshevik government made efforts to give land to the unemployed, but as the financing of such an agrarian programme necessitated large funds, little progress was made. The teaching of the tenets of the Jewish religion to children was forbidden, synagogues were confiscated and turned into Communist clubs, and Zionists were arrested and sent into exile. Jews who espoused the cause of Communism were given full freedom by the government to regulate the life of Russian Jewry, and all who dissented from their views found themselves limited in their activity and liberty.

In Poland and Lithuania after the War the Jews formed a distinct national unit on a par with the other national groups, such as the Germans, the Ruthenians, etc. Theoretically protected by the Racial Minorities Treaties, in actual life racial antagonism proved an effective barrier to their free economic, political, and cultural development. They found themselves discriminated against in the schools, and their right to free entrance into the universities was in many instances questioned. In Latvia, Rumania, Hungary, and the other countries of central and eastern Europe, with the notable exception of Czecho-Slovakia, the same condition prevailed. In Poland the anti-Semitic organization known as the Rozvoi instituted an economic boycott which brought ruin to many Jewish merchants. See POLAND; UKRAINE.

In the United States the patriotism of the American Jews was shown in 1917-18 by their undertaking of military service and liberal support of the various war loans. Henry Ford, in the *Dearborn Independent*, brought against the Jews charges of attempting to dominate the world financially and otherwise. These charges were based on the so-called "Protocols of the Elders of Zion," which were later proven to be forgeries brought to America by former agents of the Czar's secret police. Shortly after the exposure of the fraud, the *Dearborn Independent* ceased its systematic attacks.

In October, 1923, the second session of the American Jewish Congress was held. Plans were formulated for the close organization of American Jews and the continuation of the struggle against racial discrimination in the United States and abroad. The Congress urged Great Britain to enforce the conditions of the

Palestine mandate, declared in favor of a world congress of Jews, and protested against the further restriction of immigration to the United States.

Relief Work. The chief efforts of the Jews in the neutral countries during the War was directed toward relief. In the United States were established several great organizations, including the American Jewish Relief Committee, the Central Relief Committee, and the People's Relief Committee. Millions of dollars were raised and pledged for relief. Over \$6,500,000 was collected in the United States during the first two years and a half of the War; Jan. 27, 1916, was named by the President as Jewish Relief Day. Relief funds were also established in 1915-16 in Great Britain for the relief of suffering Jews throughout the world. The Federation of Rumanian Jews in the United States, at a conference in New York City in 1916, made plans for raising \$1,000,000 for the relief and emancipation of the Rumanian Jews. At a conference of relief workers early in 1917, plans were made for raising \$10,000,000. By the end of November, about half this sum had been raised. Jacob H. Schiff, with the assistance of leading Jews in the United States, initiated a drive for \$5,000,000, \$1,000,000 of which was to go to the Jewish Army Welfare Board. This sum and more was raised by December 16.

Relief activity slackened in the early part of 1918 on account of the chaotic conditions in Russia, but the work revived as the year went on. Special consideration was given to the distribution of relief funds in Palestine and elsewhere. Great activity was displayed by the Jewish Welfare Board in work for the army and navy. The great suffering of the Jews of eastern Europe during 1919 stimulated intense relief activity among the Jews of the United States. Over \$10,000,000 was raised for the relief fund by various committees. Due to the fact that with the conclusion of the Armistice the channels of communication with Poland, Rumania, and Austria were opened, distribution was able to proceed in an orderly way. The Joint Distribution Committee sent, in addition to money, large quantities of food and clothing to Poland, Rumania, and Austria. Large sums of money and enormous contributions of food and clothing continued to be sent to the suffering Jews of Europe in 1920. In 1921 conditions gradually improved in Europe, although thousands of Jews remained in want and homeless. At the close of the year a report issued by the Relief Committee of the Ukraine indicated that there were in Bessarabia about 30,000 Jewish refugees without homes; in Poland nearly 30,000 Jewish orphans were cared for by the Warsaw bureau of the committee. In Poland as a whole, there were about 50,000 refugees, and in Rumania 60,000 to 70,000. The Jewish population of the Ukraine continued to suffer incredible hardships during the year. According to the president of the Jewish Relief Committee, 50 per cent of all the houses belonging to Jews in eastern Europe had been destroyed by the end of 1921, and about 90 per cent in the regions where they had especially suffered: eastern Poland, Galicia, Poland, Lithuania, and southern Russia. See PALESTINE; ZIONISM.

Statistics. The most authoritative statistics for Jewish populations are contained in the *American Jewish Year Book*. These, however, are little better than estimates. In 1914-15 the

Jews of the world were estimated at 13,277,542; in 1923, 15,500,000. In Europe the figure is practically the same, 10,000,000 for the two periods. In America the Jews increased from 2,500,000 in 1915 to 3,700,000 in 1924. Since the Jewish occupation, it is reported that 40,000 Jews have gone to Palestine. The countries of Europe in the order of Jewish populations are Poland, the Ukraine, Germany, France, Great Britain, and Turkey.

JOFFRE, JOSEPH JACQUES CÉSaire (1852-). A French general (see Vol. XII). On Dec. 13, 1916, General Joffre was called to Paris as "technical adviser to the government" and on December 16 he was made a Marshal of France, the first to receive that title since 1870. In the spring of 1917 he was sent on a mission to the United States. He was elected a member of the Académie Française in 1918. The evidence which he gave before the Briey Commission was published under the title, *La Préparation de la Guerre et la Conduite des Opérations*, and the story of the political side of his tenure of command is given in Mermeix's *Les Crises du Commandement*, Part I.

JOHN, AUGUSTUS EDWIN (1879-). A British painter (see Vol. XII). With his vivid manner of portraiture and his ability to catch unerringly some striking and usually unfamiliar aspect of his subject, he superseded Sargent as England's fashionable portrait painter. He was commissioned by Canada during the War to paint Canadian soldiers on the western front. In 1921 he was made a member of the Royal Academy. Among his later works may be mentioned "Symphonie Espagnole," "Madame Suggia," "Robin," "The Mumpers" and "The Tinkers."

JOHNS HOPKINS UNIVERSITY. This nonsectarian institution for men and women (excluding women from some undergraduate courses) at Baltimore, Md., was founded in 1876. The student enrollment increased from 1374 for the summer and fall sessions of 1914-15 to 3891 for the year 1923-24 (753 in the summer of 1923) and the number of members in the faculty increased from 268 to 475 professors, associates, instructors and lecturers. During the same decade the library was increased from 174,777 to 257,365 volumes, the productive funds from \$6,226,287 to \$18,818,400, and the income from \$521,205 to 1,430,033. The School of Hygiene and Public Health was established by the Rockefeller Foundation in 1916 and opened in 1918; and in 1922, the Foundation gave \$6,000,000 to the School for endowment and building funds. Fire destroyed the pathological laboratory in 1919 and a larger building was completed in 1923 through a gift of \$400,000 for this purpose from the General Education Board. An alumni memorial dormitory and a women's clinic were also built in 1923. Many gifts were received for special purposes, as well as for the general ends of the university. Joseph De Lamar, who died in 1919, bequeathed \$2,500,000 for instruction and research in medicine, and the General Education Board added \$100,000 to the William H. Welch Endowment for Clinical Education and Research in 1917, in order to make possible more work in the department of pediatrics, and also gave \$250,000 to strengthen the work in the laboratory departments of the Medical School. The William H. Collins Vickers Chair in Archæology was founded in 1920, \$200,000 was received from

the estate of Eugene Mergenthaler for scientific research, and \$20,000 from the estate of Mrs. J. A. J. Creswell for instruction and research in international law. In the summer of 1923 construction work on the new chemical laboratory, which was to cost approximately \$500,000, was begun. President, Frank Johnson Goodnow

JOHNSON, ALLEN (1870-). An American educator, born at Lowell, Mass. He graduated from Amherst College in 1892 and took postgraduate courses in Germany and in France and at Columbia University. He was appointed professor of history at Iowa (now Grinnell College) in 1898, serving until 1905, and from that year to 1910 was professor of history and political science at Bowdoin College. In the latter year, he became Larned professor of American History at Yale. His published writings include: *The Intendant Under Louis XIV* (1899); *Stephen A. Douglas* (1908); *Readings in American Constitutional History* (1912); *Union and Democracy* (1915); *Jefferson and His Colleagues* (1921). From 1918 to 1921, he was editor of *Chronicles of America*.

JOHNSON, ALVIN SAUNDERS (1874-). An American economist (see Vol. XII). From 1912 to 1916, he was professor of economics at Cornell University, and from 1916 to 1918 was professor of political science at Leland Stanford Junior University. From 1917, he was also editor of the *New Republic*, New York City. His later books include *The Professor and the Petticoat*, a novel (1914); *John Stuyvesant, Ancestor* (1919).

JOHNSON, DOUGLAS WILSON (1878-). An American geologist, born at Parkersburg, W. Va. He was graduated at the University of New Mexico in 1901 and received his Ph.D. at Columbia University (1903). After teaching in public schools, he entered the United States Geological Survey as a field assistant (1899), and was later an assistant professor of geology at the Massachusetts Institute of Technology until 1907. He was also lecturer in physiography at Harvard University during 1906-12. Returning to Columbia in 1912, he became associate professor of physiography and after 1919 was professor. During the War he was connected with the intelligence work of the American Expeditionary Forces with the rank of major; and also served with the American Commission to Negotiate Peace. In addition to many scientific papers and bulletins, he is the author of *Lettre d'un Américain à un Allemand* (1916); *Topography and Strategy in the War* (1917); *Perils of Prussianism* (1917); *My German Correspondence* (1917); *Shore Processes and Shoreline Development* (1919); *Battlefields of the World War* (1921).

JOHNSON, EMOBY RICHARD (1864-). An American educator (see Vol. XII). He was assistant director of the Bureau of Transportation of the War Trade Board in 1917 and also acted as expert and adviser to several other important government boards during the War. He was president of the Association of Collegiate Schools of Business in 1920-21. His later books include *History of Domestic and Foreign Commerce in the United States* (1915); *The Panama Canal and Commerce* (1916); *Principles of Railroad Transportation* (1916); *Principles of Ocean Transportation* (1917).

JOHNSON, HIRAM WILLIAM (1866-). An American lawyer and legislator (see Vol.

XII) He served, as governor of California for the term 1911-15 and was reelected for the term 1915-19, but resigned in 1917 following his election as United States Senator from California for the term 1917-23. He was reelected in 1922 for the term 1923-29. Senator Johnson was leader of the Progressive element of the Republican party in the Senate and in 1920 was one of the leading candidates for the Republican nomination for the Presidency. He was also a candidate in 1924 for the nomination, but practically abandoned his efforts in April of that year.

JOHNSON, JAMES WELDON (1871-). An American editor and author, born at Jacksonville, Fla. He graduated from Atlanta University in 1894 and took postgraduate courses at Columbia University. After acting as principal of a high school for colored pupils in Jacksonville, he was admitted to the Florida bar in 1897. In 1901, he began practice in New York. He served as United States Consul in Venezuela and in Nicaragua from 1906 to 1912, and became secretary of the National Association for the Advancement of Colored People. With his brother, J. Rosamond Johnson, he wrote for the light opera stage. His publications include *The Autobiography of an Ex-Colored Man* (1912); *Fifty Years and Other Poems* (1917); and *The Book of American Negro Poetry* (1921).

JOHNSON, ROBERT UNDERWOOD (1853-). An American poet and editor (see Vol. XII). In 1917, he organized and was chairman of the American Poets' Ambulance in Italy. This organization presented 112 ambulances to the Italian army in four months. In 1918-19, he was president of the New York Committee of the Italian War Relief Fund of America. He served as ambassador to Italy from April, 1920, to July, 1921, and represented the United States as observer at the San Remo Conference of the Supreme Council of the League of Nations, in April, 1920. He was awarded decorations by the Italian government in recognition of his work in behalf of good relations between Italy and the United States. His later books include *Poems of War and Peace* (1916); *Italian Rhapsody and Other Poems of Italy* (1917); *Collected Poems* (1919). He published a volume of reminiscences in 1924.

JOHNSON, TREAT BALDWIN (1875-). An American chemist, born at Bethany, Conn. He was graduated in 1898 at Yale, where he also received his Ph.D. in 1901. He became an instructor of chemistry at the Sheffield Scientific School of Yale and in 1908 was advanced to the assistant professorship of organic chemistry of which branch he became full professor in 1915. Organic chemistry is his specialty and he has published papers on organic synthesis as applied to therapeutic substances, on phrenanthrene and its relation to morphine, an account of new local anesthetics, histamin, tyramin and cyclic polypeptides. In 1915, he received the Nichols medal of the American Chemical Society.

JOHNSON, WALTER (1888-). Professional baseball player, born at Humboldt, Kan. He is recognized as one of the most effective pitchers the American National game has ever known. After a brief sojourn in an obscure Rocky Mountain League he joined the Washington Club of the American League in 1907 and has been the mainstay in the box for that club ever since.

JOHNSON, WILLIAM EUGENE (1862-).

An American publicist, born in Coventry, N. Y. He was educated at the University of Nebraska and for several years was engaged in newspaper work. He was prominently connected with prohibition and was in the government employ, for the enforcement of the liquor law, for several years. He edited several prohibitionist papers and was European representative of the Anti-Saloon League of America from 1919. He wrote much on subjects connected with temperance. He carried on campaigns in England, Scotland and elsewhere, for the advancement of prohibition.

JOHNSON, WILLIS FLETCHER (1857-). An American editor, born in New York City. He graduated from New York University in 1879 and for several years taught school. He was on the editorial staff of the *New York Tribune* for many years, and was its literary editor (1917-20). In 1914, he was also on the editorial staff of the *North American Review*. From 1914, he was honorary professor of the history of American foreign relations at New York University. He was a member of many societies, and was the author of *Four Centuries of the Panama Canal* (1906); *America's Foreign Relations* (1916); *America and the Great War for Humanity and Freedom* (1917); *Political and Governmental History of the State of New York*.

JOHNSTON, SIR HARRY HAMILTON (1858-). An English public official and author (see Vol. XII). His later books include *A Gallery of Heroes and Heroines* (1915); *The Truth About the War* (1916); *The Black Man's Part in the War* (1917); *The Gay-Donbays* (1919); *Mrs. Warren's Daughter* (1920); *The Veneerings* (1922). In 1923, he published a volume of reminiscences.

JOHNSTON, JOHN (1881-). A chemist, born at Perth, Scotland. He was a Carnegie scholar at St. Andrews, Scotland, and also studied at Breslau during 1905-07. Coming to the United States, he was a research associate in physical chemistry at Massachusetts Institute of Technology in 1907-08, and during 1908-16, chemist at the geophysical laboratory of the Carnegie Institution in Washington. He had charge of the research department of the American Zinc, Lead, and Smelting Company during 1916-17 and was chemist to the United States Bureau of Mines in 1917-18. In 1919, he became professor and chairman of the department of chemistry at Yale. During the War he served as secretary to the National Research Council. His original investigations have had to do with topics in geochemistry and physical chemistry on which he has published the results of his studies, notably in the *Journal of the American Chemical Society*. In 1914, he became a member of the editorial board of the *Society*.

JOHNSTON, MARY (1870-). An American novelist (see Vol. XII). Her later books include *The Fortunes of Garin* (1915); *The Wanderers* (1917); *Foes* (1918); *Michael Forth* (1919); *Sweet Rocket* (1920); *Silver Cross* (1922); *1492* (1922).

JOHORE. See MALAY STATES, NON-FEDERATED.

JONES, EDGAR DEWITT (1876-). An American clergyman and author, born at Hearne, Texas, and educated at the University of Missouri and Illinois Wesleyan University. He became a minister of the Disciples of Christ.

denomination in 1901 and held pastorates in Kentucky, Ohio, Illinois, and Michigan. During 1915-16 he was president of the Illinois Convention of the Disciples, and from 1917 to 1919 of the International Convention of the Disciples. In 1922 he joined the staff of the *Detroit News*. His writings include: *The Inner Circle* (1914); *The Wisdom of God's Fools* (1916); *Fairhope, the Annals of a Country Church* (1917); *The Tender Pilgrims* (1917); *Ornamented Orthodoxy* (1918); *When Jesus Wrote on the Ground* (1924); *The Wisdom of Washington and the Learning of Lincoln* (1924).

JONES, GRINNELL (1884-). An American chemist, born at Des Moines, Iowa. He was graduated at Vanderbilt University and in 1908 received his Ph.D. at Harvard. In 1916, he returned to Harvard as assistant professor. In 1917-19, he was also chief chemist to the United States Tariff Commission to which in 1919 he assumed a consulting relation. Dr. Jones has determined the atomic weights of sulphur and phosphorus and has studied the electrochemistry of silver iodide, and the fixation of atmospheric nitrogen, on which he has published papers in chemical journals. He is also the author of numerous reports issued by the Tariff Commission.

JONES, HILARY POLLARD (1863-). An American naval officer, born in Virginia. He graduated from the United States Naval Academy in 1884. He served in the Spanish-American War, and was in command of the Navy Yard in Washington from 1906 to 1909. He served on shore and afloat in many important capacities, and in 1917 was made commander of Squadron One, Patrol Force, Atlantic Fleet. In the same year he was appointed commander of Division One, Cruiser Force, Raider Guard, of the Atlantic Fleet, and was director of the Naval Overseas Division from January to July, 1919. He was appointed to be vice-admiral of the 2d Battleship Squadron of the Atlantic Fleet, from 1919 to 1921, and from the latter date was promoted to be commander-in-chief of the Atlantic Fleet.

JONES, LAUDER WILLIAM (1869-). An American chemist, born at New Richmond, Ohio. He was graduated at Williams College in 1892, and received his Ph.D. from the University of Chicago in 1897. In the same year, he became an assistant in chemistry at Chicago, where he remained until 1907. From 1907 to 1918, he was professor of chemistry at the University of Cincinnati, and from 1918 to 1920, he was dean of the School of Chemistry at the University of Minnesota, after which he accepted a call to the chair of chemistry at Princeton. He has devoted his attention chiefly to organic chemistry and has published papers on nitro-paraffin salts, alkyl derivatives of hydroxylamin, preparation of hydroxamic acids from hydroxylamin of organic acids, electron conception of valence, and preparation of electromeres. During the War he served with the Chemical War Service as its chief of the research section of offense. Dr. Jones is the author of *A Laboratory Outline of Organic Chemistry* (1911).

JONES, ROBERT EDMOND (1887-). An American artist born in Milton, N. H., and educated at Harvard University. He started his career of designing for the theatre in New York City in 1911, and among his notable works are his designs for *The Man Who Married a Dumb*

Wife; *The Jest*; *Richard III*; *The Birthday of the Infanta*; *Macbeth*; and *Redemption*. He has conceived of the theatre as an art by itself and he knits together the various scenes of the play by his design effects. There is a simple and unpretentious symbolism in all of his works; in his *Richard III*, the Tower of London looms up behind every scene as it does in the minds of his characters.

JONES LAW (MERCHANT MARINE ACT OF 1920). See SHIPPING.

JONNART, CÉLESTIN AUGUSTIN CHARLES (1857-). A French diplomat. He was born at Flechin, Pas de Calais, and was educated in the law. In 1882, he entered upon his political and diplomatic career by becoming a member of the private cabinet of the Governor-General of Algeria. He subsequently was elected deputy from the Pas de Calais and became president of the regional council. Before the War he was Governor-General of Algeria and Senator from his district. During the War he was the Inter-Allied High Commissioner in charge of Grecian Affairs, and was instrumental in effecting the entrance of Greece into the War on the side of the Allies. In 1921, when the French government resumed relations with the Vatican, he was made professor at the Holy See.

JONNESCO, THOMAS (1861-). A celebrated Rumanian surgeon for many years professor of surgery in the University of Bucharest. He has been distinguished especially for his attempts to cure certain diseases by dividing some part of the cervicothoracic sympathetic nerve and has recently reported cures of angina pectoris—usually regarded as purely a degenerative affection—by this resource. His major writings comprise *La Raichianesthésie Générale* (1919) and *Le Sympathique Cervico-Thoracique* (1923). The division of the sympathetic by his technique is known as Jonnesco's operation.

JOWETT, JOHN HENRY (1864-1923). A British-American clergyman (see VOL. XIII). In 1918 he returned to England and became a pastor of Westminster Chapel. His last appearance in public was at the conference in Copenhagen of the World's Alliance for Promoting International Friendship through Churches.

JOYCE, JAMES (1882-). An Irish author. He was educated at Dublin, but spent his manhood in Europe, largely in Paris. His works were few: *A Portrait of the Artist as a Young Man* (1914); *Chamber Music*, a book of lyrics; *Exiles*, a play; *Dubliners*, a collection of short stories; *Ulysses* (1922). His first novel, *A Portrait*, had been highly received: it contained lyrical powers and a dignity and honesty that marked it off; but it was his *Ulysses* that gave him almost a universal attention and made him the storm-centre of a bitter literary controversy. The novel has almost 500,000 words, little plot in the accepted sense, and marks a violent break with the current technique. It was attacked for its crudities and its formlessness; and it was extolled for its frankness and the epic quality of its portraiture. Whether or not it marked a milestone in the intellectual history of the twentieth century remained to be seen, but that it contained elements of great courage, understanding, and a depth of feeling could not be denied.

JUGO-SLAVIA. Jugo-Slavia, or as it is officially known, "The Kingdom of the Serbs, Croats, and Slovenes," comprises the old kingdoms of Serbia and Montenegro, combined with

certain provinces originally belonging to the Austro-Hungarian Monarchy. The country is situated in southern Europe, bordering on the Adriatic Sea; area, 96,134 square miles; population, census of 1920, 12,017,323. Jugo-Slavia is primarily an agricultural state, the great bulk of its population being agrarian, and most of its income is derived from farming and stock raising. Racially the population is divided into Jugo-Slavs, 10,900,000; Germans, 560,000, Magyars, 450,000, Albanians and Turks, 550,000, Rumanes and Vlachis, 200,000; the remainder consisting of Italians and other nationalities. There is no dominant religion in the country, and freedom of worship is guaranteed. The majority of the people, however, are either Orthodox or Roman Catholic. The population is distributed by religions as follows: orthodox, 5,843,000; Catholic, 4,923,000; Moslem, 1,363,000, Protestant, 235,000, and Jewish, 79,000. Cities of over 20,000 are: Belgrade, 120,000, Zagreb, 80,000; Ljubliana, 60,000; Sarajevo, Novi Sad, Spalato and Nish.

Agriculture. The total agricultural and forest area in 1922 was 47,434,000 acres, including cultivated land, 15,954,000; meadows, 4,093,000, pastures, 6,895,000; vineyards, 458,000, orchards, 634,000; forests, 18,988,000; and marshes, 413,000. While there were many small land owners, there were still many large estates, particularly in the provinces of Slovenia, Vojvodina, and Slavonia. The problem of the breaking up of these large holdings was, during the period, the chief problem of the agrarian reform. Pre-war grain yields in bushels were: wheat, 63,666,000; rye, 10,142,000; barley, 20,280,000; oats, 33,500,000; and corn, 11,892,000. The crops of all these cereals declined, as was shown by the 1923 production, wheat being then 61,876,500 bushels; rye, 5,911,000 bushels; barley, 14,327,000 bushels; oats, 19,354,000 bushels; and corn, 88,554,000 bushels. This decline in yield may be accounted for through the conversion of the land to other uses, principally fruit growing and stock raising. Besides the principal cereals enumerated, Jugo-Slavia also cultivated, in lesser quantities, buckwheat, millet, rice, lentils, beans, and peas. There were also increasingly large crops of tobacco and sugar beets, tobacco production having grown from 3,000,000 pounds, pre-war, to 44,995,000 pounds in 1923. Production of sugar beets in 1923 was 331,000 short tons.

Mining. Mining was little developed in Jugo-Slavia in 1924, although a great diversity of minerals was known to exist. The industry only began to assume any real importance within the last century, with the exception of the provinces of Slovenia and Croatia (formerly parts of the Austro-Hungarian Empire). There were, however, many traces of old workings for gold and copper dating back to the days of the Roman Empire, and also to the Middle Ages. The principal minerals found in the country were brown coal, anthracite, bauxite (used in the manufacture of aluminium), lead, iron, copper, sulphur, antimony, silver, and gold. Petroleum and asphalt also occurred in various parts of Jugo-Slavia, but not in large quantities. The large coal deposits were of great advantage to the industries of Jugo-Slavia, the principal mines being located in the provinces of Slovenia, the only drawback being that they consisted almost entirely of brown coal and lignite, which was inferior to the British, Belgian, and Silesian black

coal, and in many cases was unsuitable for industrial consumption. All coal so far mined in Slovenia, Croatia-Slavonia, or Bosnia was of this inferior quality, the only anthracite being found in Serbia. Coal production for 1922 was 3,719,938 metric tons; for 1921, it was 2,949,103 metric tons. No statistics for pre-war production are available.

Forest. The forests of Jugo-Slavia covered about 32 per cent of her entire area, lumbering being one of the principal industries of the country. The forests were particularly valuable assets to the country because of their close proximity to the Mediterranean, whereas most of the other countries bordering on it had been more or less deforested, and the demand for Jugo-Slav timber was constantly increasing. The principal varieties of trees found were birch and oak, and in lesser quantities, fir, pines, and spruce. The provinces of Bosnia and Slovenia were the principal timber sections of the country.

Industry. The manufacturing industry of Jugo-Slavia was still in the early stages of its development, and consisted principally of flour milling, weaving, tanning, boot making, pottery manufacturing, and iron foundries. In view of the immense water power resources of the country, a great development in this phase of the industrial life was hoped for. One of the greatest difficulties in the development of manufacturing was the lack of proper railway facilities, and when the railways projected in 1924 are completed this handicap will be, to a great extent, removed. In 1922, there were 5696 miles of railroads all owned by the state with the exception of 974 miles. Locomotives numbered 1809; freight cars, 38,065 (14,000 in need of repairs); passenger cars, 2866. In 1920, telegraphs, 11,430 miles of line; and telephones, 16,030 miles of line.

Commerce. The foreign trade of old Serbia in 1911 was: imports \$22,277,000, and exports \$22,564,000. These figures, however, do not afford a proper basis of comparison with statistics on foreign trade for post-war years, in view of the much greater present area of the country. Imports for 1921 were \$97,694,000, for 1922, \$85,676,000; and for the first six months of 1923, \$38,800,000. Exports for 1921 were \$58,320,000; 1922, \$49,092,000; and for the entire year of 1923, \$86,244,000. The principal countries of origin of imports for the first six months of 1923, in order of value, were Austria, Czechoslovakia, Italy, Germany, England, and the United States. The principal countries of destination of exports for the entire year of 1923, in order of value, were Austria, Italy, Czechoslovakia, Switzerland, and the United States. The principal items of import were textiles, metals and metal products, machinery and vehicles, chemical and pharmaceutical products. The principal items of export were lumber, grain, cattle, meat products, eggs, and dried prunes.

Finance. Bank note circulation at the end of 1923 was 5,790,241,000 dinars; gold reserve, 68,838,000 dinars. Average exchange rate of the dinar, 1913, \$0.193 (par); 1921, \$0.0237; 1922, \$0.0133; 1923, \$0.10715. The dinar exchange was practically stabilized at the latter figure in 1923-24. The foreign pre-war debt, converted at par, was \$169,999,000, in 1924, but would be much less if discharged in paper currency of the several countries, due to their

depreciated currencies. War debts to the British, French, and American governments, at par, were \$451,950,000; pre-war debts of Austria and Hungary (assumed), converted at agreed exchange rates, \$4,452,000. In addition there were several foreign loans negotiated after the War. The total foreign debt was approximately \$650,000,000 in 1924.

Education. Elementary education was compulsory and in the schools under the Ministry of Education was free. In 1920, there were 5974 elementary schools with 12,758 teachers and 800,868 pupils; number of secondary schools was 139, with 2794 teachers and 55,636 pupils; there were three universities located at Belgrade, Zagreb, and Ljubljana, with a total of 333 professors and accommodating about 12,000 students.

Government. Jugo-Slavia is a constitutional monarchy, whose ruler in 1924 was Alexander I, former King of Serbia. The present constitution was adopted on Jan. 1, 1921 and provides for a single chamber called Narodna Skupština, consisting of 313 representatives elected for four years on the basis of one member for every 40,000 inhabitants. The military defense of the country was provided for by a peace-time army of 7000 officers and 120,000 men recruited on the basis of universal service. Compulsory service was enforced for men between the ages of 21 and 45 in the first line, and for men between 18 and 21 years and 45 and 50 years for the second line defense. The navy consisted of 12 torpedo boats and four monitors.

History. While the new kingdom of the Serbs, Croats, and Slovenes did not become a reality until December, 1918, the idea of a unified Jugo-Slavia was by no means new. Here and there, throughout the nineteenth century sporadic movements made their appearance whose purpose was the union of the southern Slav peoples under a single head. The creation of the Dual Monarchy of Austria-Hungary gave the notion of Jugo-Slav unity a serious setback and for a time, at the beginning of the twentieth century, the idea was completely submerged. The Dual Monarchy played off Serbs against Croats while the Serbian kingdom was to all practical purposes treated as a fief of the Austrian-Hungarian throne. But from 1905 on Serbs and Croats became more conscious of kindred interests and, as dissatisfaction with Magyar supremacy grew, the more real became the belief in a Jugo-Slav nation. Not without reason Austrian officials suspected that the southern Slav agitation in the Dual Monarchy was being fostered by Serbia; it can be seen, therefore, why Austrian animosity toward Serbia was so keen. Serbian victories in the Balkan War only succeeded in increasing the Slav ardor for freedom, and the hot-headed proposals of the students' organizations, to which belonged the assassins Princip and Cabrinovitch, brought on unnecessary excesses. Throughout the War, Slavs in Austria-Hungary suspected of any sympathy with the patriotic propaganda were treated with the utmost cruelty. Thousands died in the internment camps; all literary and intellectual communications were cut; the police courts had no mercy on any, even school boys, with whom the idea of Pan-Slavism might be linked. In all the provinces except Croatia, every semblance of government disappeared to the accompaniment of wholesale confiscations

and the terrorization of the civilian population. Abroad the claims of these peoples, i.e. for the dissolution of the Dual Monarchy and the liberation of Serbs, Croats, and Slovenes, were constantly kept before the eyes of the Allied populations by the Jugo-Slav Committee headed by Dr. Trumbitch and Mr. Supilo. The secret Treaty of London of April, 1915, by which the Allies gained the adhesion of Italy by promising away large sections of Gorizia, Istria, Carniola, and Dalmatia, was in effect a betrayal of the Jugo-Slav cause, and though the Jugo-Slav Committee became immediately acquainted with the terms of the treaty its loyalty to the Allies and its own aspirations suffered only slightly. For the spoliation of Serbia by enemy invaders came soon after and served to strengthen the common resolve. To the Jugo-Slav Committee support was added in 1917 by the Jugo-Slav Club, made up of sympathizers in the Austrian Reichsrat, as well as by the exiled Serbian government under Mr. Pashitch. By Mr. Pashitch for the Serbian government and Dr. Trumbitch for the Jugo-Slav Committee was signed the "Corfu Declaration" (July 20, 1917) which set forth the principles of southern Slav unity under the Karageorgevitch dynasty together with the democratic tenets of universal suffrage and freedom of religion. A further step in the direction of Jugo-Slav independence was realized when Jugo-Slavs and Italians came together in 1918 and decided to work for their common purpose, i.e. the defeat of the Dual Monarchy and the freeing of the Adriatic. This meeting and a similar one at Prague had the desired effect with the result that defections from the Austro-Hungarian ranks became increasingly numerous. Thenceforth it was merely a question of months to the creation of the Jugo-Slav kingdom. There were difficulties, of course, even after the collapse of Austria-Hungary. The Serbian government sought to found a kingdom with itself as a nucleus; to the Jugo-Slavs under Dr. Trumbitch nothing less than the entire Jugo-Slav programme would do. Again Italian disapproval served seriously to retard the formation of the new state. Finally, however, on Nov. 23, 1918, an act of union was promulgated at Zagreb, the capital of the ex-Austrian Slav provinces, and Prince Alexander was invited to take the throne of a united Jugo-Slavia. At the same time King Nicholas of Montenegro was deposed and Montenegro (q.v.) joined the union. See SERBIA, *History*.

The path of the new state was to be a thorny one in the beginning. Italy consistently refused its recognition of the accomplished fact of the Jugo-Slav state and at the Peace Conference unalterably insisted not only on the Treaty of London line but, in addition, Fiume. To the Jugo-Slavs mediation by President Wilson of the whole Adriatic question was perfectly acceptable; to the Italians, aware of President Wilson's doctrines of self-determination and also understanding that on such a basis not all their claims could be substantiated, there was no way out but the Treaty of London. Wilson's proposals they hotly rejected and Wilson's sensational declaration of Apr. 23, 1919 over the heads of the Italian government, infuriated the Italian people. The Adriatic question continued intermittently to trouble the progress of southern Europe affairs for the next four years. For the D'Annunzio escapade, the succeeding conversa-

tions with the Supreme Council, the patched-up Treaty of Rapallo of Nov. 12, 1920, and finally the threatening gesture of Mussolini and the Peace of Rome of January, 1924, see the article *Fiume-Adriatic Controversy*. Jugo-Slavia was, in a sense, the victor, for, excepting the cession of Fiume to Italy, the new line followed substantially Wilson's proposals of 1919. There were other questions that served to distract attention from domestic concerns and to prevent that reconstruction that was so sorely needed. The division of the Banat of Temesvár (q.v.), which both Jugo-Slavia and Rumania claimed on ethnographic grounds, was not consummated until 1920, when, by the Treaty of the Trianon Jugo-Slavia finally gained the western county (Torontál) as well as the Bačka district containing the large city of Szabadka. To the southwest, the Pan-Serbs agitated for the annexation of the Scutari region (northern Albania). Not until 1921 did Jugo-Slavia agree to relinquish her claims to this rich district, which included the valleys and outlets of the Drin and Boyana Rivers. Again the settlement of the Austrian boundary line presented difficulties. By the treaty, a plebiscite had to be held in the Klagenfurt (q.v.) area before its disposition could be finally determined. In October, 1920, one of the two zones voted to remain in Austria, with the result that the whole area was restored. By the Treaty of Neuilly (November, 1919) Bulgaria was forced to give up to Jugo-Slavia, on the east, the Strumitsa district as well as the Tsaribrod and Bosilegrad districts.

Thus, not until 1921 was Jugo-Slavia ready to turn to the business of setting her house in order. In November, 1920, elections were held for members of a Constituent Assembly, and the meeting of that body, the first to represent the opinion of the new state, indicated something of the new loyalties. Cleavages were largely on racial and then on economic lines, although religious animosities were also apparent. Decentralization was particularly favored by the Catholic Croats and Slovenes, who feared the supremacy of the Orthodox Serbs. The Communists gathered about them the dissident spirits from the late enemy provinces, especially the Bačka, as well as the Mohammedans of Bosnia. The character of the new groupings may be adduced from the parties represented in the Constituent Assembly. There were 102 Radicals, 94 Democrats, 42 Communists, 51 Croatian-Agrarians, 33 Serb Agrarians, 25 Mohammedans, 21 Catholic People's party. As a result of these fundamental differences the establishment of the new state proceeded slowly. Government by bloc was the only way out and could be carried on only as a result of the alliance of the Radicals and the Democrats, strengthened by the adherence of the Bosnian Mohammedans and the Slovene Agrarians. It was only on June 28, 1921, that the constitution, embodying the notion of a centralized Serb state, finally passed through the Assembly. Even then this result could hardly have been achieved had not the entire Croat delegation of 161 members quit the body. Throughout 1922, however, the new constitution was not promulgated, the rump Assembly remaining in control and the government under Mr. Pashitch continuing in office despite the well-authenticated charges of disregard for ministerial responsibility. Communist outbreaks in 1921 added to the

general uncertainty and were followed by harsh measures of reprisal in which the Communist members were expelled and the constitutional guarantees annulled. However, the increasing growth of the Peasant party indicated the true temper of the country. Jugo-Slavia is essentially agricultural and its problems centre in the development of its natural resources and the spread of its means of communication. To these the country was increasingly devoting itself and making as rapid headway as the vexatious administrative questions would permit. In the field of foreign affairs the prevailing policy was conciliatory. By a series of conventions with Czechoslovakia and Rumania in 1920 and 1921, the Little Entente (q.v.) was constituted to check the Habsburg pretensions; in October, 1923, Jugo-Slavs gained Greek permission for their use of the port of Saloniki; in 1924, an understanding was effected with Italy (q.v.) for the amicable settlement of the Adriatic problem. The friendliness of France contributed much toward strengthening the financial structure of the new state and the security of its national integrity. Jugo-Slavia was assured of a respectable place among Central European nations. The first general election, March, 1923, gave the same groups that had controlled the Constituent Assembly, ascendancy in the national Parliament. Mr. Pashitch remained at the head of affairs, his party and that of the Democrats backing vigorously his resolute attitude toward the separatist Croats. Though in February, 1924, 96 Croats once more appeared to take their seats in the Parliament after an absence of four years, their policy continued hostile, as was shown by their opposition to the Fiume treaty and their continual demands for Croatian independence. In March, and again in April, 1924, by combining with the other Opposition groups, the Croats succeeded in compelling Premier Pachitch to resign. Thanks to the King's continued confidence in him, the veteran leader returned to power, each time, with a reconstructed cabinet. But the significance of Croatian opposition was larger than mere cabinet jugglery would indicate. The important fact revealed by more than four years of Croatian obstruction was that the Croats, though willing to unite with their kinsmen in a decentralized Jugo-Slav nation, were irreconcilably opposed to the continued dominance of the Serbs in the new and enlarged nation. Territorial consolidation had proved to be but the first step toward genuine national unification, and the other steps remained to be made. The head of the Croat movement was Stephen Raditch, whose whole-hearted devotion to the cause of the Croat peasant earned him the regard of all the Balkan peoples. By 1924 he was a leader of the first importance in southeastern Europe and his leaning toward Russia, together with his strength in Macedonia, encouraged the belief, expressed widely in the summer of 1924, that Soviet Russia would have little difficulty in gaining over the Balkan peoples, once such an offensive was launched.

JUNG, CARL GUSTAV (?-). A celebrated Swiss psychologist and psychoanalyst. Jung, who was the earliest convert to the new doctrines of Freud was at that time assistant to Professor Bleuler (q.v.) the psychiatrist of the Zurich University, who also was favorably disposed to the new departure. All of his works

are in English translations: *Psychology of Dementia Praecox* (1909); *Theory of Psychoanalysis* (1915); *Analytical Psychology* (1916); *Psychology of the Unconscious* (1916); *Studies in Word Association* (1918) and *Psychological Types* (1923). Jung has divided all mankind into extroverts and introverts with many subdivisions. See PSYCHOLOGY, ABNORMAL, AND PSYCHOANALYSIS; ASSOCIATION TESTS.

JUNIOR HIGH SCHOOLS. See EDUCATION IN THE UNITED STATES

JUSSERAND, JEAN ADRIEN ANTOINE JULES (1855-). A French diplomat and scholar (see VOL XIII). During the War his services were of the greatest value, both in France and the United States. He had profound knowledge of English literature and life. Two of his later works were: *A Literary History of the English People* (1913) and *With Americans of Past and Present Days* (1916).

JUTLAND, BATTLE OF. See WAR IN EUROPE, *Naval Operations*.

JUVENILE COURTS. Although the first juvenile courts were established about 1900, during the last decade marked progress has been made in the formulation of principles and the development of methods of administration. In 1914, a report of a special committee of the National Probation Association appointed to consider juvenile courts and their administration was published in book form under the title of *Juvenile Courts and Probation*, by Bernard Flexner and Roger N. Baldwin. This statement of the aims of the juvenile court and detailed discussion of the means by which its purposes may be realized, together with the educational work of the National Probation Association, of State organizations supervising juvenile court work, and of individual judges and probation officers, have brought increased recognition of the importance of the movement and the administrative standards that must be maintained. In 1923, following a series of studies made by the Children's Bureau of the United States Department of Labor and conferences held under the joint auspices of that Bureau and the National Probation Association, a detailed statement of Juvenile-Court Standards was published by the Children's Bureau and widely distributed.

Since it aims to save, rather than to punish, the delinquent child and to protect the neglected and dependent child, the primary function of the juvenile court is not to determine whether or not a child has committed a specific offense, but through social investigations and physical and mental examinations, to ascertain the needs of each child and determine the treatment to be given. Children are to be kept in their own homes if possible, and if institutional care is needed, it must be educational and not punitive. To attain these ends, the procedure in children's cases must not be criminal in nature, and the court hearings must be entirely separate from the trials of adult offenders. The hearings must be private and informal (see COLORADO, *Political and Other Events*), and must be held before a judge or referee who understands problem children and is able to use intelligently the resources which the community and the State provide; and skilled probation service and facilities for expert study of the child's physical and mental condition must be available. Children are to be kept in their own homes if possible pending the hearing and de-

termination of their cases, and if detention is required for their own welfare or the public safety, it must not be in jails or police stations, but in family boarding homes or special detention homes adequately equipped for constructive service.

These are the ideals of the juvenile court, but their realization even in the larger cities is far from complete, and in many small towns and rural districts throughout the country children are still subjected to publicity, criminal procedure, jail detention, and treatment that can not be effective because of the absence of facilities for the study of the child and for skilled probation service. Nevertheless, real progress has been made in the last 15 years (up to 1924) in the extension of juvenile court principles and practice. In 1910, legislation authorizing probation in children's cases was on the statute books of 38 States and the District of Columbia, but the application of this legislation was mainly confined to the larger cities. Eight years later, juvenile court laws having been passed in every State except two, and laws authorizing probation in children's cases in every State except one, a survey was made by the Children's Bureau of the United States Department of Labor, covering 2034 juvenile courts and other courts hearing children's cases. This study showed that of an estimated 175,000 children's cases in 1918, 125,000 were heard by courts with some degree of special organization, and that such service existed in all the large cities and in 71 per cent of the cities having populations of from 25,000 to 100,000. The minimum degree of specialization used as a basis of comparison in this survey was separate hearings for children, officially authorized probation service, and the recording of social information. Only 321 courts, or 16 per cent of those reporting, had even this minimum; and almost half of these courts were in five States. It was found that many States were not fully carrying out their laws. From at least one court in every State came reports of detaining children in jails, and in 37 courts in 18 States no effort was made to separate children detained in jails from adult offenders; more than one-fourth of the courts with probation service reported that no provision whatever was made for physical examinations, and relatively few courts had facilities for mental examinations. Although authorized in every State but one, probation service was known to have been used during the year in only 45 per cent of these courts with jurisdiction over children.

Considerable progress has been made since 1918 in the extension of juvenile court service to rural communities, chiefly as a result of activities of State departments and the new movement for the organization of county child welfare or public welfare boards, working in co-operation with State departments. State assistance rendered juvenile courts includes the preparing of forms, the developing of community co-operation, securing appointment of probation officers, training probation officers, publishing educational literature, and advising and assisting in difficult cases. Among the States in which county organization has been in progress are: Minnesota, North Carolina, Missouri, and Virginia. Alabama, Georgia, Indiana, Pennsylvania, North Dakota and a few others have been added to the older list of States, including Massachusetts and New York, in which

State supervision or stimulation of juvenile court work has been carried on.

In addition to its extension, the juvenile court movement during the last decade has been marked by the broadening of jurisdiction, increased specialization, the development of higher standards of probation service, and closer supervision of its scientific study of the child, and the growth of the practice of dealing informally with cases which do not require official court action or prolonged treatment.

The original age limits have been raised so that in 1922, the limit was 18 years or higher in approximately one-third of the States. More classes of cases have been included, such as aid-to-mothers cases and in a few States adoption cases and cases involving feeble-minded children. In order to increase the effectiveness of the work of the children's courts, by 1922 jurisdiction over adults contributing to delinquency or dependency of children had been granted in the majority of the 40 States that had enacted laws on the subject, this jurisdiction usually being concurrent with that of the criminal courts; jurisdiction over desertion and non-support cases had been given in 12 States; and in some States jurisdiction over cases of offenses against minors not under the "contributing to delinquency or dependency" laws, and of violations of child-labor laws. There has been a definite tendency to give to a juvenile court or to a court of domestic relations general jurisdiction over all cases involving children or the relationship of adults to children. At the same time, there has been noticeable a movement to free the juvenile courts from certain types of administrative work such as child-placing, and from responsibility for cases which can easily be handled by such organizations as school-attendance departments.

Certain standards for probation work have been evolved—that it should be a regular, paid service by trained persons, and should when necessary extend to the reconstruction of the child's family, school, vocational, and recreational relationships. Definite training courses for probation officers have been established in universities and in schools of social work. Pro-

bation staffs have been increased, and more adequate salaries for workers have been secured.

Since 1910 more specialized judicial service has been gained, the earlier system under which judges served in rotation for only a short period having been replaced to a large extent by longer assignments. In many of the larger cities special judges give full time to juvenile court work, and woman referees have been authorized to hear the cases of girls, as in San Francisco, or to hear the cases of girls and of younger boys, as in Los Angeles, and to make recommendations as to the disposition of the cases. Referee power has been given to woman probation officers in Detroit, Cincinnati, and also in other cities.

Because the fundamental concept of the juvenile court is to supply corrective treatment according to the individual needs, the principle of scientific diagnosis has been developing certainly, if slowly. In addition to providing means of investigating the social history of the child and his family, of giving physical examinations and treatment and routine mental tests, there has been a growing movement to provide psychiatric clinics for the study of all the associated factors of conduct. Scientific diagnostic study as a regular service for delinquents and for a court began in Chicago in 1909. Since 1922, to demonstrate the value of such service to juvenile courts and other agencies dealing with children, the Commonwealth Fund of New York, through the National Committee for Mental Hygiene, has been financing the assignment of psychiatric clinics to selected communities for limited periods, and has also been supporting training courses for psychiatric social workers and probation officers given by the New York School of Social Work.

Juvenile courts, in one form or another, closely modeled after those in the United States, were established after 1899 in England, France, Russia, and, in fact, all the principal European countries. The movement had also appeared in Japan. Its extension in the decade was rapid and far-reaching; in 1923, there was hardly a civilized country in which it had not manifested itself at least in spirit.

K

KAHN, GUSTAVE (1859-). A French symbolist poet, born at Metz, and educated in Paris at the Ecole des Chartes, and the Ecole des Langues Orientales Vivantes. He founded with John Moreas and Paul Adam the periodical, *Le Symbolisme*, the organ of the young poets of the 1880's and 1890's and was reputed to have been the first to employ free verse. His early verse showed the influence of Beaudelaire and expressionism. In later years, when the symbolist group gradually broke up, Kahn turned to essays and to the æsthetics of fine art. His works include: *Les Palais Nomades* (1887); *Chansons d'Amants; Domaine des fées* (1895); *La Pluie et le Beau Temps; Le Roi Fou* (1895); *Limbes de Lumière; Premiers Poèmes; Le Livre d'Images* (1897); *Le Conte de l'Or et du Silence* (1898); *Les Petites Ames Pressées* (1898); *Le Cinq Solaire* (1899); *Les Fleurs de la Passion* (1900); *L'Esthétique de la Rue, Adulère Sentimental; Odes de la Raison; Etude sur Boucher; Symbolistes et Décadents; De Tartuffe à ces Messieurs; Le Polichinelle du Guignol; Contes Hollandais; La Femme dans la Caricature Française*.

KAHR, AUGUST RICHARD VON (1862-). A German public official, born at Weisserling. He was active in the establishment of the Bavarian Republic, and in March, 1920, was made Minister-President. He came into conflict with the Reich government over questions of authority and resigned his post in September, 1921, largely as a result of the opposition of General Ludendorff and other reactionaries. In 1923 he was appointed general commissioner of state in full charge of the government and held this position during the attempt of Adolf Hitler and General Ludendorff to overthrow the government. The failure of this attempt resulted in the arrest of Hitler and Ludendorff. See *BAVARIA*.

KAISER, GEORG FR. G. (1878-). A German playwright of the expressionist school. He was born at Magdeburg, attended college and engaged in commerce at Buenos Aires. After 1901 he devoted himself to the drama. He is the author of *Rektor Kleist* (1910); *Die Jüdische Wittwe* (1911); *König Hahnrei* (1913); *Die Bürger von Calais* (1914); *Lorina* (1917); *Die Versuchung* (1917); *Claudia, Friedrich, Anna, Juana*, a one-act cycle (1918); *Von Morgen bis Mitternacht*, produced in the United States in English translation (1919); *Gas* (1920); *Die Koralle* (1920); and *Das Frauenopfer* (1920).

KAISER, ISABELLE (1866-). A Swiss novelist writing in German and French (see *VOL. XIII*). In the period 1914-24 she published: *Von Ewiger Liebe* (1914); *Le Vent des Cimes* (1916); *Rahels Licht* (1921); *Hilda, die Heze* (1921); and *Die Nächte der Königin* (1924).

KALEDIN, ALEXEI (1861-1918). A Russian general, of Cossack birth. During the great

offensive of Brussilov in 1916, he commanded one of the Russian armies. He succeeded Brusilov as commander of the 8th Russian Army. His masterly conduct of the campaign of Volhania and the capture of Lutsk gained for him the title of "Hero of the Lutsk." Following the outbreak of the Russian Revolution, in 1916, he became leader of the Cossacks, who elected him hetman, or commander-in-chief. On hearing of the defeat of General Alexeiev on the Don River, in 1918, he committed suicide.

KALLEN, HORACE MEYER (1882-). An American philosophical writer (see *VOL. XIII*). He was born in Silesia, Germany, May 11, 1882, and was brought to this country at the age of four. He was educated at Harvard University and also studied at the Sorbonne and at Oxford. He was named by James as editor of his unfinished book, *Some Problems in Philosophy* (1910). After teaching at Harvard (1908-11), he went to the University of Wisconsin (1911-19). When the New School of Social Research was organized in New York City, he was called in as lecturer in philosophy. He is the author of the following works: *William James and Henri Bergson* (1909); *Creative Intelligence*, with John Dewey and others (1916); *The Structure of a Lasting Peace* (1918); *Zionism and World Politics* (1921); *The League of Nations, To-day and To-morrow* (1921); and *Culture and Democracy in the United States* (1924).

KAMERUN. Formerly a German protectorate on the west coast of Central Africa, but since its capture by British and French troops in 1916, part of the British and French Empires under the names of British Cameroon and French Cameroon (qq.v.). It had an area of 305,000 square miles and a population of 3,650,000 of whom whites numbered 1871 on Jan 1, 1913. Of these, 1643 were Germans. German penetration had been confined only to the coastal region, while the natives of the interior still recognized the sovereignty of the local Emir of Yola. Cocoa culture was the leading activity of the whites. Exports, made up of rubber, palm products, ivory, cocoa, and tobacco, totaled \$5,500,000 in 1912, and imports, \$8,100,000. Shipping in 1912 amounted to 1,733,000 tons, over half of which was carried in German vessels. For administration, \$3,700,000 was annually derived from customs, and \$1,500,000 was received as an imperial grant. Kamerun was captured by Allied armies in 1916 (see *WAR IN EUROPE, Colonies*), and in May, 1919, it was conferred as a mandate territory on Great Britain and France. The strip bordering on Nigeria, about 30,000 square miles, fell to Great Britain, while the area of 107,200 square miles in the East and South which Germany had received in 1911 from France was once more incorporated in French Equatorial Africa. The remaining districts in the centre, about 167,000 square miles, became a French mandate territory. See *CAMEROON, BRITISH*; and *CAMEROON, FRENCH*.

KANDEL, ISAAC LEON (1881-). An

American educator, born in Rumania. He studied in Manchester, England, and at Columbia and the University of Jena. For several years he taught in universities in Ireland and from 1908 to 1910 was scholar and teaching professor at Columbia University. In 1915 he was associate professor of education at Teachers' College, Columbia University, and in 1914 became specialist of the Carnegie Foundation for the Advancement of Teaching. He was a contributor to several encyclopædias and was the author of *Elementary Education in England* (1914); *Federal Aid for Vocational Education* (1917); *Education in Germany* (1918); and *Reports on Education in Great Britain, Ireland, Germany and France* (1919).

KANSAS. Kansas is the thirteenth state in size (82,158 square miles) and the twenty-fourth in population; capital, Topeka. The population increased from 1,690,949 in 1910 to 1,769,257 in 1920, a gain of 4.6 per cent. The white population rose from 1,634,352 to 1,708,906; Negro, from 54,030 to 57,925. The number of foreign-born whites decreased from 135,190 to 110,578. The urban population mounted from 493,790 to 617,964, while the rural fell from 1,197,159 to 1,151,293. The growth of the principal cities was as follows: Kansas City (q.v.), 82,331 to 101,177; Wichita, 52,450 to 72,217; Topeka, 43,684 to 50,022.

Agriculture. Kansas is one of the most important of the agricultural States. Conditions, during the decade 1910-20, especially in the latter part of that period, were greatly affected by the general agricultural situation in regard to wheat and other grain products, for an account of which see AGRICULTURE, CORN, WHEAT, etc. While the population of the State increased 4.6 per cent in the decade 1910-20, the number of farms decreased 7.1 per cent (from 177,841 to 165,286). In 1910 the total acreage in farms was 43,384,799, compared with 45,425,179 in 1920, an increase of 4.7 per cent, and the improved land in farms also increased, from 29,904,067 to 30,600,760 acres. The total percentage of land in farms increased from 82.9 in 1910 to 86.8 in 1920, but the percentage of improved land in farms decreased from 68.9 to 67.4. The total value of farm property showed an apparent increase from \$2,039,389,910 to \$3,302,806,187: the average value per farm, from \$11,467 to \$19,982. In interpreting these values, however, as indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration; the index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 165,286 farms in 1920, 97,090 were operated by owners, 1495 by managers, and 66,701 by tenants. The comparative figures for 1910 were 111,108, 1335, and 65,398. White farmers in 1920 numbered 164,048, compared with 176,150 in 1910; native-born, 146,859, compared with 150,346; foreign-born, 17,189 compared with 25,804; colored, 1238 compared with 1691. In 1920 the number of dairy cows was 681,267, as compared with 736,107 in 1910; "beef cows," 912,892, compared with 558,153; mules, 243,332, compared with 196,078; sheep, 361,102, compared with 204,023. The number of hogs decreased greatly during the decade (from 3,037,000 in 1910 to 1,816,000 in 1920), the war-time prices of wheat having caused the supplanting of much corn. The esti-

mated production of the chief farm crops for 1923 was as follows: corn, 126,905,000 bushels; spring wheat, 115,000; winter wheat, 83,678,000; oats, 33,343,000; barley, 23,366,000; potatoes, 4,918,000; and hay, 3,060,000 tons. Comparative figures for 1913 are: corn, 23,424,000 bushels; wheat, 86,983,000; oats, 34,320,000; barley, 1,994,000; potatoes, 2,920,000; and hay, 1,350,000 tons.

Mining. The principal mineral products of the State are petroleum, coal, natural gas, and cement. There is practically no metal mining. The progress of the petroleum industry during the decade 1914-24 is indicated by these figures: production in 1914, 3,103,585 barrels; 1915, 2,823,487; 1916, 8,738,077; 1917, 36,536,125; 1918, 45,451,017; 1920, 39,005,000; 1921, 36,456,000; and 1922, 31,766,000. The greatly increased production in the latter years indicates a remarkable development in the new petroleum fields throughout the State. The coal production in 1914 was 6,860,988 short tons, valued at \$11,238,253; 1916, 6,881,455, \$12,252,723; 1917, 7,184,975, \$16,618,277; 1918, 7,561,947, \$22,028,142; 1920, 5,926,408, \$22,923,000; 1921, 3,466,641, \$13,333,300. The value of clay products varied during the decade from \$1,905,961 in 1914 to \$2,064,520 in 1918; \$4,921,740 in 1920, and \$3,739,594 in 1921; the increased value in the latter part of the period was due largely to the decreased purchasing power of money and the consequent higher prices. Shipments of cement, exclusive of natural cement, varied from 3,237,006 barrels in 1914 to 2,586,834 in 1918; 4,158,399 in 1920; and 3,643,582 in 1921. In addition to products mentioned above, the State produces a considerable quantity of gypsum, lead, natural gas, and sand and gravel. The total value of the mineral products in 1921 was \$113,098,346, compared with \$198,007,758 in 1920, \$120,759,783 in 1919, \$149,902,091 in 1918, and \$25,866,351 in 1914. In the value of its mineral products, Kansas ranked ninth among the States in 1921.

Manufactures. While Kansas is chiefly an agricultural State, it is also important industrially. There are 17 cities which have a population of more than 10,000, the combined population of which forms 23.6 per cent of the total for the State. In 1919 72.1 per cent of the total value of the State's manufactures were reported from these cities. There were in the State, in 1909, 3435 manufacturing establishments; in 1914, 3136; and in 1919, 3474. Persons engaged in manufacture numbered 54,649, 52,032, and 77,009, in those years; and capital invested amounted to \$156,090,067, \$163,789,752, and \$357,534,129. The value of products in 1909 amounted to \$325,104,002; 1914, \$323,234,194, and 1919, \$913,667,094. While the increase in the value of the product in 1914-19 is in great measure due to changes in industrial conditions brought about by the War, the increase in the average number of wage earners clearly indicates a decided growth in manufacturing activities in the State. The most important industry in point of value of products is that connected with slaughtering and meat packing, the value of the product in 1909 being \$165,361,000; in 1914, \$151,647,000, and in 1919, \$427,663,000. Flour-mill and gristmill products rank second; in 1909, they were valued at \$68,476,000; in 1914, \$72,895,000, and in 1919, \$206,881,000. Petroleum refining, in third place, in 1909 amounted to \$4,077,000; in 1914,

to \$8,923,000, and in 1919, to \$63,786,000. Car and general shop construction and repairs amounted, in 1909, to \$11,193,000; 1914, \$12,889,000; and 1919, \$28,231,000. The chief manufacturing cities in the State are Kansas City, Topeka and Wichita. There were in Kansas City, in 1909, 165 establishments, with a product valued at \$164,081,000; 1914, 201 with \$159,700,000, and in 1919, 196 with \$468,686,000. In Topeka, in 1909, there were 202 with \$17,821,000, 1914, 161 with \$20,685,000; and 1919, 169 with \$45,708,000. Wichita had 223, in 1909, with \$10,267,000; 1914, with \$11,668,000; and 238, in 1919, with \$38,580,000.

Education. Kansas has been one of the most progressive of the States in educational matters. Its progress continued during the decade 1913-23. The Legislature passed during that period many measures designed to improve the educational system. One of the most important was the rural high school measure of 1915. This law permitted legal electors residing in territory containing not less than 16 square miles and comprising one or more townships or parts thereof to establish rural high school districts and to establish and maintain therein a rural high school. Under this law, over 240 rural high schools were organized. The Legislature of 1923 passed an important educational act reorganizing the county high school system, abolishing normal county high schools, and creating and establishing community high schools and providing for the payment of tuition in connection therewith; and by the end of 1923, 26 such high schools had been established. The same Legislature passed a measure for carrying out the provisions of the law of 1917 relating to vocational education; and useful legislation relating to the blind and deaf and dumb. The name of the normal schools of the State was changed to teachers' colleges. A Board of Administration was authorized to make a survey of the southwestern part of the State, and to determine the advisability of establishing State normal and teachers' colleges, and was to present its report to the Legislature of 1925. The school population of the State increased from 510,273 in 1913 to 539,248 in 1923. The school enrollment in 1914 was 392,662; in 1923 it was 427,310. Kansas has always been among the States with the lowest percentages of illiterates. Its percentage decreased from 2.8 in 1910 to 2 in 1920; among the native-born from 1.1 to 0.7 per cent, among the foreign-born, from 10.3 to 10.2; among the Negro, from 15.9 to 11.2.

Finance. See STATE FINANCES

Political and Other Events. The period 1914-24 was filled with events of political and economic interest in the State. In 1914 there were elections for United States senator and governor and other State officers. Senator Bristow, whose term expired on Mar. 3, 1915, was a candidate for renomination on the Republican ticket. He was opposed by Charles Curtis and by Victor Murdock, Progressive leader of the House of Representatives. Mr. Curtis received the Republican nomination and was elected in November. Arthur Capper, Republican candidate, was elected governor. At this election a constitutional amendment providing for the recall of public officials, was adopted. In 1916 Governor Capper was reelected, and the Republicans elected all the other State officers and the majority of the Legislature. In spite of this fact, President Wilson carried the State,

receiving 314,588 votes, compared with 277,658 for Charles E. Hughes. In 1918 Governor Capper was elected United States Senator on the Republican ticket, and Henry J. Allen, Republican, was elected governor. In 1919 a general strike in the coal fields of the State resulted in the taking over of the mines by the State authorities under the direction of Governor Allen and their operation by volunteers. The Legislature in this year created an Industrial Court, before which should be brought all matters in dispute between employers and employees in what the law describes as "basic industries," including food, fuel, clothing, and all public utilities. In 1920 Senator Curtis was reelected to the Senate, and Henry J. Allen was reelected governor. In the presidential voting of this year, Warren G. Harding received 396,195 votes; James M. Cox, 185,447. The constitutional amendments were adopted at this election, relating to promotion of farm home-owning, against the increase of farm tenancy, and to the promotion of good roads. The Kansas Court of Industrial Relations, created by the Legislature of 1919, was organized, and at the close of the year, 28 industrial cases had been filed, 20 of these by labor organizations, and in 13 cases wage increases had been granted. On Apr. 9, 1920, strikers in the coal mines were arrested and placed in jail for ignoring the summons of the Industrial Court. On April 30, the Industrial Court was declared constitutional by the State Supreme Court. On Feb. 7, 1921, Alexander Howat, the leader in the coal mining strike, was arrested by the authorities of the Industrial Relations Court for calling a strike in violation of an injunction. He was convicted. In 1922 the Democrats came into power by the election of their candidate for governor, Jonathan M. Davis. In his campaign he spoke against the Industrial Court and promised a reduction of taxes. Governor Davis was inaugurated in January, 1923. His message was devoted chiefly to agricultural problems, and he indicated strong opposition to the Court of Industrial Relations, favoring the substitution of an industrial commission. Although the Legislature did not act on his recommendations, the functions of the Industrial Court were greatly curtailed by a decision of the United States Supreme Court on June 11 that the court had no power to fix wages. See LABOR ARBITRATION.

Legislation. The most important acts of the Legislature in the decade 1914-24 are indicated below. Several measures passed in 1915 were designed to strengthen the prohibition laws of the State. The Legislature of 1917 amended the laws relating to the administration of the State government and created a State manager for State institutions, his duties including those of purchasing agent; enacted a general prohibition law; and amended the child labor law. The woman suffrage amendment to the constitution was ratified on June 16, 1919, and the prohibition amendment on January 14 of the same year. The Legislature of 1921 abolished the Industrial Welfare Commission and conferred its powers on the Court of Industrial Relations; created a State aircraft board; made provision for the establishment and maintenance of city planning commissions in cities of the first class; and imposed a penalty for the failure to employ the English language exclusively in teaching in the elementary schools. A Public Utilities Commission was created, and provision was made

for the organization of rural high school districts and for the consolidation of school districts for educational purposes. An election was authorized to be held in 1922 on the question of compensation of veterans of the War. This proposal, which called for the issuance of \$25,000,000 in bonds, was carried by the people. The Legislature of 1923 accordingly passed a soldiers' bonus law. It also authorized a board of administration to make contracts for the drilling of oil and gas wells on land under its control belonging to the State, where there is a State institution on such land within two miles of one or more producing oil wells. The Legislature of 1923 submitted to the people to be voted on at the general election of 1924 a constitutional amendment qualifying the provision of "uniform assessment and taxation" and permitting the Legislature to distinguish among subjects of taxation.

KANSAS, UNIVERSITY OF. A coeducational State institution at Lawrence, Kan., founded in 1864. The university showed a steady growth during the entire period between 1914 and 1923-24. The student enrollment increased from 2812 in 1914 to 4557 in the year 1923-24 and 1506 in the summer of 1923; the faculty membership was increased from 200 to 303, and the library from 100,000 to 159,000 volumes. Ernest H. Lindley succeeded Frank Strong, Ph.D., as Chancellor in 1920.

KANSAS CITY. A city in Kansas. Its population increased from 82,331 in 1910 to 108,851 in 1920. The estimated population in 1924 was about 122,000. This includes the suburb of Rosedale, which was annexed in 1922. The manufacturing establishments decreased from 261 in 1914 to 196 in 1919. The value of products, however, increased from \$159,700,000 in 1914 to \$468,808,000 in 1919. Among the notable achievements in the decade from 1914 to 1924 was the organization of a Chamber of Commerce, which constructed a \$100,000 building. During the war years, a community war chest was organized. There was under construction in 1924 a war memorial, to cost \$500,000. A new court house, to cost \$1,000,000, was authorized. Extensive enlargements were being made in the latter part of the period on the municipal water and light plants, and a \$5,000,000 bond issue was voted for the purpose. A junior college was under construction in 1924. In 1923, 1955 building permits were issued, an increase of 60 per cent over the preceding year; the number of building permits in 1924 exceeded those of any previous year by a considerable amount. Among other important accomplishments were the creation of the 1300-acre Fairfax Industrial District, and the Kansas City, Missouri, Railway and its terminal, one of the few terminals for electric roads in the western United States.

KANSAS CITY, Mo. An important industrial and railroad centre in Missouri. The population rose from 248,381 in 1910 to 324,410 in 1920, and to 351,819, by estimate of the Bureau of the Census, for 1923. Between 1914 and 1924 a viaduct and double-deck bridge, a 14-mile boulevard, a 15-mile sewer system, and a dyke for flood protection were built by the city. At the close of the War a Liberty Memorial was built, including a shaft with a crucible at the top, in which a fire was to burn constantly, a hall of records, and a fraternity house, all surrounded by 33 acres of land in the heart of the

city. The \$2,500,000 necessary for the project was raised by popular subscription. One of the largest baseball parks of the country was completed in 1923. Home-rule charter-making powers were acquired by the city in 1920. The park area increased from 2600 acres in 1914 to 3470 in 1923 and the paved streets from 400 to 600 miles. The bank clearings of Kansas City rose from \$3,835,061,547 in 1915 to \$11,615,142,427 in 1920 and fell again to \$6,881,567,927 in 1923; building permits increased from 3517 valued at \$10,667,405 in 1915, to 5831 valued at \$24,327,400 in 1923; customs receipts from \$262,279 to \$416,803; and postal receipts from \$3,195,424 in 1915 to \$8,528,482 in 1923. The value of factory output rose from \$319,000,000 in 1915 to \$590,192,037 in 1923, and live stock from 6,503,509 in 1915 to 8,537,267 in 1923, valued at \$250,588,240.

KANSAS WESLEYAN UNIVERSITY.

A coeducational institution under the auspices of the Methodist Episcopal Church founded in 1885 at Salina, Kan. The enrollment of the College of Liberal Arts rose from 149 in 1919 to 526 in 1924; the total enrollment in the latter year was 1044. The faculty increased in membership from 20 in 1918 to 38 in 1924, and the library from 12,000 to 15,000 volumes. A new physical laboratory was equipped in 1920, and a new administration building was in process of construction in 1924. The curriculum of the College of Commerce was expanded to a four-year course leading to the bachelor's degree and commercial teacher's certificate; courses were established in secretarial science. An endowment campaign for \$800,000 was completed in 1919. Rev. L. B. Bowers, D.D., succeeded Rev. John F. Harmon as president in 1919.

KAPP, WOLFGANG (1868-).

A German revolutionist, born in New York City. He was the son of Friedrich Kapp, a well-known Liberal leader, and was born while his father was in exile in the United States. He founded the Agricultural Credit Institute of East Prussia, which was very successful. During the War he was one of the leading representatives of the Junkers and bitterly opposed all measures taken to establish a republic. In March, 1919, he headed a conspiracy to obtain control of the government. This was at first successful, and he was installed as Imperial Chancellor. He endeavored to form a government but was frustrated largely by a universal strike, which rendered him powerless. The movement collapsed on March 17, and he fled to Berlin, escaping by airplane to Sweden. See *GERMANY, History*, for an account of the Kapp Putsch.

KAPP PUTSCH. See **TRADE UNIONISM, Germany.**

KARAFUTO. See **SARHALIN.**

KARELIA CONTROVERSY. See **FINLAND, RUSSIA.**

KAROLYI, MICHAEL, COUNT (1875-).

A Hungarian statesman. His family, for centuries, had been one of the most influential and important in Hungary and filled a conspicuous place in the political history of the country. Before and during the War, he manifested strong pacifism and outspokenly condemned German ideals of world dominion. In 1916 he was trusted with the Austro-Hungarian peace overtures to the Allies. When defeat was realized, he was called on, in November, 1918, to form a ministry. His first task was to conclude peace with General D'Esperey, commander on the

Macedonian frontier. Later in the same month he became provisional president of the Hungarian Republic. His endeavors to restore order were frustrated by the Bolshevik propaganda under Bela Kun, and he resigned in March, 1919. He took no further active part in the government. He visited the United States in 1923 in the interests of Hungary. See HUNGARY, *History*.

KARPINSKI, LOUIS CHARLES (1878-). An American mathematician, born at Rochester, N. Y., and educated at Cornell University and Strassburg. He also studied (1900-10) at Columbia, where he was a fellow and a university extension lecturer. Meanwhile he taught mathematics at Berea (1898-1900) and at the Oswego (N. Y.) Normal School during 1903-04, but in 1904 accepted a call to Michigan where in 1919 he became full professor of mathematics. Dr. Karpinski has devoted his attention chiefly to the history and pedagogy of mathematics. An authority on the history of science, he was collaborator on the *Archivio di Storia della Scienza* and author of *The Hindu-Arabic Numerals*, with D. G. Smith (1911), *Robert of Chester's Latin Translation of the Algebra of Khwarazmi* (1915), and *Unified Mathematics*, with H. Y. Benedict and J. W. Calhoun (1918).

KATANGA. See COPPER.

KATO, TOMOSABURO (1859-1923). A prime minister of Japan (see VOL. XIII). In the War he was commander-in-chief of the First Fleet which guarded Allied transportation from German raiding in the Pacific. After the War, as minister of marine, he began to build up Japan's navy. He headed the Japanese delegation to the Disarmament Conference at Washington and afterward won his government's consent to the treaty. He became premier in June, 1922, on his return from the Washington conference. He died at Tokyo in 1923. See JAPAN, *History*.

KAUFFMAN, REGINALD WRIGHT (1877-). An American author (see VOL. XIII). He served on the Mexican border in 1916 and enlisted in 1917 for service in France. His later books include *The Latter Day Saints*, with Ruth Wright Kauffman (1917); *The Azure Rose* (1918); *Our Navy at Work* (1918); *Victorious* (1919); *Money to Burn* and *The Ranger of the Manor* (1924).

KAUFFMAN, RUTH WRIGHT (MRS. REGINALD WRIGHT) (?-). An American writer and war correspondent, born in New York City, and educated at Bryn Mawr and in Paris, France, at the Collège de France. During 1905 and 1906 she investigated women's work in department stores, offices, and domestic service, and in 1909 she investigated "white slavery" in the United States and Europe. During the War she was correspondent for *Leslie's* and for *The Christian Herald* and was the first woman correspondent at the American front in France. In 1918 she was connected with the Publicity Department of the American Red Cross. Her writings include: *Women War Workers* (1919); *Three Little Kittens* (1922); *The Boundary Line* (1923); *The "I-Don't-Want-To" Series*, for children (1924).

KAUFMAN, GEORGE S. (1889-). An American playwright, born at Pittsburgh, Pa. For several years he conducted humorous daily columns in the *Washington Times* and the *New York Evening Mail* and was subsequently on the dramatic staff of the *New York Tribune* and of the *New York Times*. He was the author, with

Marc Connelly, of many successful plays, including *Dulcy* (1921); *To the Ladies* (1922); and *Beggar on Horseback* (1924).

KAUTSKY, KARL JOHANN (1854-). An Austrian Socialist (see VOL. XIII). He was one of the most important and prolific writers among the Social Democrats of Germany. During the War he supported the militarism of the Kaiser and said that the Socialists could do nothing to stop the conflict. In 1919 he published four volumes of documents, pertaining to pre-war history, with marginal notes by the ex-Kaiser, which raised a storm in Germany and which the newspaper *Vorwarts* declared showed that Germany before the War was ruled by a man all but mad. In 1920 Kautsky appealed to American Socialists to help reestablish the Socialist Internationale. He was strongly anti-Bolshevik. After the War he published: *Der Politische Massenstreik* (1914); *Die Vereinigten Staaten Mitteleuropas* (1916); *Die Befreiung der Nationen* (1917); *Serbien und Bulgarien in der Geschichte* (1917); *Elsass-Lothringen* (1917); *Uebergangswirtschaft* (1918); *Die Diktatur des Proletariats* (1918); *Hapsburgs Gluck und Ende* (1918); *Demokratie oder Diktatur?* (1918); *Die Sozialisierung der Landwirtschaft* (1919); *Wie der Weltkrieg Entsteht* (1919); *Terrorismus und Kommunismus* (1919); *Delbruck und Wilhelm II* (1920); and *Vergangenheit und Zukunft der Internationale* (1920).

KAWAKAMI, K. K. (1875-). A Japanese writer, born in Tokyo. He was educated in the law in Japan and was for a short time engaged in newspaper work in that country. In 1901 he came to the United States and studied at the Universities of Iowa and Wisconsin. In 1905, engaged in journalism, he traveled extensively in China, Siberia, and Russia. He was a correspondent for leading newspapers in Tokyo and a frequent contributor to American magazines and newspapers. He wrote: *Political Ideas of the Modern Japan* (1903); *Asia at the Door* (1914); *Japan and World Politics* (1917); *Japan and World Peace* (1919); *The Real Japanese Question* (1921).

KAYE-SMITH, SHEILA (?-). An English novelist, born at St. Leonard's on the Sea. Her first published novel was *The Tramping Methodist* (1908). This attracted wide attention and was followed by *Star Brace* (1909); *Spell-Land* (1910); *Isle of Thorns* (1913); *Three Against the World* (1914); *Sussex Gorse* (1916); *Little England* (1918); *Tamarisk Town* (1919); *Green Apple Harvest* (1920); and *Joanna Godden* (1921). She was generally recognized as one of the most distinguished of the younger English novelists.

KEDAH. See MALAY STATES, NON-FEDERATED.

KEEN, WILLIAM WILLIAMS (1837-). An eminent American medical man (see VOL. XIII). He published several books during the decade 1914-24: *Treatment of War Wounds* (1917); *Medical Research and Human Welfare* (1917); *I Believe in God and Evolution* (1922); and *Selected Papers and Essays* (1923). He has delivered numerous lectures defending animal experiments and was very active during the War in behalf of the Allies. He received special honors from England and France. In 1917 he was appointed a member of the National Research Council.

KEITH, SIR ARTHUR (1866-). A British anthropologist (see VOL. XIII). He was

Fullerian Professor at the Royal Institute, 1917-23, and afterward its secretary. He edited and wrote numerous works on anatomy and anthropology, including: *Antiquity of Man* (1914); *Menders of the Maimed* (1919); *Engines of the Human Body* (1920); and *Nationality and Race* (1920).

KELANTAN. See MALAY STATES. NON-FEDERATED

KELLOGG, FRANK BILLINGS (1856-). An American lawyer and diplomat (see VOL. XIII). In 1916 he was elected United States Senator from Minnesota for the term 1917-23 but was defeated for reelection in 1922. In 1923 President Harding appointed him American Ambassador to Great Britain to succeed George B. M. Harvey.

KELLOGG, JOHN HARVEY (1852-). An American hygienist (see VOL. XIII). Dr. Kellogg has shown almost unparalleled activity as a writer of books, many of them large volumes, since 1915. They comprise: *Colon Hygiene* (1915); *The Hygiene of Infancy* (1916); *The New Method in Diabetes* (1917); *Plain Facts*, a summary of some of his older writings (1917); *Auto-intoxication* (1918); *Rational Hydrotherapy* (1918); *The Itinerary of a Breakfast* (1919); *The Health Question Box* (1920); *The New Dietetics* (1921); *Tobaccoism* (1922).

KELLOGG, OLIVER DIMON (1878-). An American mathematician, born at Linwood, Pa., and educated at Princeton and Göttingen. During 1902-05 he was an instructor at the John C. Green School of Science at Princeton, and during 1905-20 he was at the University of Missouri, where he became full professor in 1910. On leave from Missouri, he was mathematician at the United States Naval Experiment Station in New London, Conn. In 1919 he became a lecturer on mathematics at Harvard and in 1920 an associate professor there. He has been interested in various problems of integral and differential equations, potential functions, and functional theory, on all of which he has published papers in mathematical journals. Dr. Kellogg is a fellow of the American Association for the Advancement of Science and presided over the section on mathematics in 1919 with the rank of vice president.

KELSO, JAMES ANDERSON (1873-). An American theologian, born at Rawal Pindi, India. He studied at Washington and Jefferson College, the Western Theological Seminary and in Germany. He was ordained to the Presbyterian ministry in 1898. In 1897 he was instructor in Hebrew at the Western Theological Seminary and was successively professor of Hebrew and Old Testament literature, acting president, and president of this institution (1908-). He was the author of many books on theological subjects, including *A History of the Hebrews in Outline* (1921) and *A Hebrew Prophet and His Message* (1922). He contributed to several Bible dictionaries and to the religious and secular press.

KEMAL PASHA, MUSTAPHA (1879-). A Turkish general and political leader, born in European Turkey (Macedonia). He was educated for the army at the Imperial Turkish Military School at Constantinople and early displayed unusual military abilities. During the War he served on the Turkish General Staff and was division manager in the Gallipoli campaign against the British. Here he displayed a skill and aggressiveness which were a large factor in

the failure of the British to occupy the peninsula. Following the defeat of the Central Powers and the occupation of Constantinople by the Allies, he went to Anatolia, where he reorganized the 3d Army Corps and in September, 1919, having renounced allegiance to the Constantinople government, called a Turkish Nationalist Assembly at Siva. A government was organized of which he was chief. He was joined by many Turkish officers and men and was soon master of a large part of Asia Minor. In April, 1920, a permanent assembly, of which he was president, was organized at Angora. This assembly refused to recognize the Treaty of Sèvres and carried on war with Armenia, with the French in Cilicia, and with the Greeks, to whom Smyrna and other portions of Asia Minor had been given by the Treaty of Sèvres. He became virtual dictator of the Nationalist government. By treaty with the Soviet republics of the Caucasus in 1921, he added a large part of Armenia to the Angora government, and by treaty with France in the same year, he regained Cilicia. On Jan. 1, 1922, he declared that the Nationalist government in Angora, while respecting the Sultan, did not recognize his authority as superior to that of the Turkish people. He carried on a campaign against Greece in 1922, and by his signal defeat of the Greek armies in Asia Minor in September of that year, he became virtual master of Turkey. In August, 1923, he was elected president of the National Assembly, and in March, 1924, first president of the Turkish Republic. As president he used his influence with the Assembly in the move to separate church and state in Turkey, and on Mar. 3, 1924, the caliphate was abolished.

KEMMERER, EDWIN WALTER (1875-). An American economist (see VOL. XIII). His later works include: *Modern Currency Reforms* (1916); *The United States Postal Savings System* (1917); *Monetary System of Mexico* (1917); *The A B C of the Federal Reserve System* (1918); and *High Prices and Deflation* (1920).

KEMP, HARRY HIBBARD (1883-). An American author, born in Youngstown, Ohio, and educated at the University of Kansas. He made a trip around the world, on which he started with only twenty-five cents, and also traveled all over North America in the guise of a tramp. He made special studies of night life in London and New York. He wrote: *Judas*, a play (1910); *The Cry of Youth*, poems (1914); *The Thresher's Wife*, poems (1914); *The Passing God*, poems (1919); *John Gregory*, a novel (1922); and *Tramping on Life* (1922).

KENDALL, EDWARD CALVIN (1886-). An American chemist, born at Norwalk, Conn., and educated at Columbia University. He at once entered the employ of Parke, Davis, and Company, of Detroit, Mich., with whom he remained until 1911, when he returned to New York City and was for three years connected with St. Luke's Hospital. In 1914 he became head of the Section of Chemistry at the Mayo Clinic in Rochester, Minn., and also professor of biochemistry at the University of Minnesota under the Mayo foundation. His chief studies have been on the secretions of the human body, especially of the pancreas and the thyroid gland; his valuable researches have included the isolation of the active principles of the latter. On these subjects he has published papers in the journals of the American Chemical Society and

of the Society of Biological Chemists. He is a member of both these organizations.

KENDALL, (WILLIAM) SERGEANT (1869-). An American figure painter (see VOL. XIII). Among his awards from 1914 to 1924 was a gold medal for painting from the Panama-Pacific International Exposition in 1915. He was dean of the School of Fine Arts at Yale University, 1913-22. Among his later works may be mentioned "Crosslights" and "Intermezzo."

KENLY, WILLIAM LACY (1864-). An American soldier, born at Springwood, Md. He was graduated at the United States Military Academy in 1889 and entered the army as second lieutenant of the 4th Artillery in June of the same year and continued in the service until 1919, when he was retired with the rank of colonel. Meanwhile, in the war with Spain, he had participated in the actions of El Caney and Santiago. During 1899-1902 he was in the Philippines. He was in France in command of artillery, with the rank of brigadier-general (1917), and later had the second brigade of the Field Artillery. In 1918 he returned to the United States and was made director of military aeronautics with the rank of major-general in the National Army. He was active in the organization of the Army Air Service Association in 1918 and was its first president. His services abroad were recognized by the decorations of the Legion of Honor, the Order of the Bath in 1919, and the Order of the Crown in 1920. Since his retirement he has been active in the development of oil interests in Oklahoma.

KENNEDY, DANIEL JOSEPH (1862-). An American clergyman and educator, born in Knox County, Tenn., and educated in schools in the United States and in Europe. He was ordained to the Roman Catholic priesthood in 1884. He filled chairs in the faculty of colleges in Europe and in 1906 became lecturer on sacramental theology at the Catholic University of America. In 1920 he was professor of dogmatic theology at this university. His several books on theological subjects include *Saint Thomas and Medieval Philosophy* (1919). He also contributed many articles to Catholic periodicals and encyclopædias.

KENOTRON. This device, in the interval between 1914 and 1924, was developed from a scientific laboratory toy to a practical article of commerce. It will rectify small alternating currents (0.25 amperes) at 100,000 volts. Four of them have been arranged to rectify both half-cycles of 0.25 amperes at 200,000 volts. The kenotron consists of a hot cathode, platinum, tungsten, or impregnated tungsten, and a cold plate or anode in a high vacuum. The heated electrode emits electrons which are carried to the cathode by the correct potential, but as the cold electrode does not emit electrons there can be no current in the opposite direction. It is based on the Fleming valve.

KENT, NORTON ADAMS (1873-). An American physicist, born in New York City, and educated at Yale and Johns Hopkins Universities. During 1901-03 he was an assistant at the Yerkes Observatory and then held the chair of physics (1903-06) at Wabash College. In 1906 he was called to Boston, where in 1910 he became full professor. He had made original investigations of such subjects as electric sparks in liquids and in air at high pressure, the shift

of spark lines due to changed conditions, vacuum tube discharge in magnetic field, and magnetic separation of lithium doublets, on all of which he has published the results of his studies.

KENT, ROCKWELL (1882-). An American artist. He was born at Tarrytown Heights, N. Y. His art studies were followed at Columbia University, and under Chase, Henri, Hayes Miller, and Thayer. He first attracted attention in 1907 with his pictures of Maine, such as "Winter" and "Seiners," realistic marines notable for their strength of outline and massing of color. In 1913 he visited Newfoundland and brought back works which included the imaginative "House of Dread," "A Newfoundland Didge," and "The Voyage Beyond Life," pervaded by a dark atmosphere of mystery. Thereafter, during a sojourn in Alaska in 1918, he produced work of a symbolic and spiritual quality which was highly reminiscent of Blake. Among these decorative, clean-lined drawings, the "Mad Hermit" series was particularly noteworthy. His trip to Tierra del Fuego in a lifeboat in 1922 was also productive of mystical impressions. He was the author of *Wilderness* (1920) and *Voyaging* (1924).

KENTUCKY. Kentucky is the thirty-sixth State in size (40,598 square miles) and the fifteenth in population; capital, Frankfort. The population increased from 2,289,905 in 1910 to 2,416,630 in 1920, a gain of 5.5 per cent. The white population rose from 2,027,951 to 2,180,560, the native white increasing from 1,987,898 to 2,149,780, while the foreign-born white fell off from 40,053 to 30,780. The negro population decreased from 261,656 to 235,938. The urban and rural populations both increased, the former from 555,442 to 633,543, and the latter from 1,734,463 to 1,783,087. The growth of the principal cities was as follows: Louisville (q.v.), 1910, 223,928, and 1920, 234,891; Covington, 53,270 to 57,121; Lexington, 35,099 to 41,534. Newport fell from 30,309 to 29,317.

Agriculture. While the population of the State increased 5.5 per cent in the decade 1910-20, the number of farms increased 4.4 per cent (from 259,185 in 1910 to 270,626 in 1920); the acreage in farms decreased from 22,189,127 to 21,612,772, or 2.6 per cent; and the improved land in farms decreased from 14,354,471 acres to 13,975,746. The total value of farm property showed an apparent increase, from \$773,797,880 in 1910 to \$1,511,901,077 in 1920; the average value per farm from \$2986 to \$5587. In interpreting these values, however, and indeed all comparative values in the decade 1914-24, the inflation of currency in the latter part of the period is to be taken into consideration; the index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes decreased from 86.3 per cent in 1910 to 84 per cent in 1920; the percentage of improved farm land from 55.8 to 54.3 per cent. Of the 270,626 farms in 1920, 179,327 were operated by owners, 969 by managers, and 90,330 by tenants. The corresponding figures for 1910 were 170,332, 993, and 87,860. White farmers in 1920 numbered 257,998, compared with 247,455 in 1910; colored farmers 12,628, compared with 11,730. There was a decrease of 9.8 per cent in the colored population in the decade, which noticeably affected the farm labor situation. Farms free from mortgage in 1920 numbered 116,613, and those under mort-

gage, 40,615. Unmortgaged farms in 1910 numbered 135,505, and those under mortgage, 33,039. The total number of cattle in 1920 was 1,093,453, compared with 1,000,937 in 1910; dairy cattle, 659,794, compared with 409,834; hogs, 1,504,431, compared with 1,491,816; sheep, 707,845, compared with 1,363,013. The estimated production of the principal farm crops in 1923 was as follows: corn, 95,168,000 bushels; wheat, 7,688,000; oats, 4,021,000; barley, 161,000; potatoes, 5,614,000; sweet potatoes, 2,142,000; tobacco, 565,186,000 pounds; and hay, 1,154,000 tons. Comparative figures for 1913 are: corn, 74,825,000 bushels; wheat, 9,860,000; oats, 3,168,000; potatoes, 2,450,000; hay, 674,000 tons; and tobacco, 281,200,000 pounds.

Mining. Kentucky is an important producer of minerals. It ranked eighth in the value of these products in 1921. Its resources are limited almost entirely to nonmetallic minerals, since there is practically no metal mining in the State; in the order of value they are coal, petroleum, clay products, and stone. The progress of the industry during the decade 1914-24 is indicated by comparative figures. The coal production in 1914 was 20,382,763 net tons, valued at \$20,852,463; 1915, 21,361,674, \$21,494,008; 1916, 25,393,997, \$30,193,047; 1917, 27,807,971, \$60,297,653; 1918, 31,612,617, \$80,666,642; 1920, 35,690,762, \$146,576,000; 1921, 31,588,270, \$85,092,600; 1922, 2,134,175 short tons. The increased value of production in the latter years was largely due to the decreased purchasing power of money and the consequent higher prices received for commodities. The output of petroleum varied during the decade from 502,441 barrels in 1914 to 437,274 barrels in 1915; 3,088,160 barrels in 1917; 4,367,968 in 1918; 8,738,000 in 1920; 9,012,600 in 1921, and 8,973,200 in 1922. In addition to the minerals mentioned above, the State produces considerable quantities of natural gas, gasoline, sand and gravel, and stone. The total value of the mineral products in 1921 was \$114,404,662, compared with \$195,920,036 in 1920; \$110,305,840 in 1919; \$104,165,945 in 1918; and \$26,668,474 in 1914.

Manufactures. While Kentucky is not one of the chief manufacturing States, it has industries of great importance. There are eight cities with more than 10,000 inhabitants, the combined population of which in 1919 was 17.9 per cent of the total for the State. In 1919 these cities reported 72.7 per cent of the value of the State's manufactured products. In 1909 there were in the State 4776 manufacturing establishments; in 1914, 4184, and in 1919, 3957. Persons engaged in manufacture in those years numbered 79,060, 77,865, and 83,954. Capital invested amounted to \$172,778,805, \$193,423,069, and \$276,535,395. The large increase in the value of products in 1914-19 was due chiefly to the change in industrial conditions brought about by the War and therefore cannot properly be used to measure the growth of manufactures during the census period, 1914-19. Flour-mill and gristmill products are most important in point of value, with \$22,365,000 in 1909; \$21,229,000 in 1914, and \$45,774,000 in 1919. The lumber and timber products industry is second, amounting in 1909 to \$21,381,000; 1914, \$20,667,000; 1919, \$34,456,000. Car construction and repair ranks third, with products, in 1909, worth \$6,535,000; 1914, \$13,344,000; 1919, \$30,598,000. Tobacco manufac-

tures, in 1909, amounted to \$15,598,000; 1914, \$16,147,000; 1919, \$24,129,000. The chief manufacturing cities in the State are Louisville, Covington, and Newport. There were in Louisville, in 1909, 903 establishments, with a product valued at \$101,284,000; in 1914, 778, with \$105,223,000; in 1919, 767, with \$204,566,000. In Covington, in 1909, there were 196, with \$8,712,000; in 1914, 161, with \$8,265,000; and in 1919, 133, with \$17,121,000. Newport had, in 1909, 144 manufacturing establishments, with a product valued at \$6,491,000; 1914, 100, \$8,306,000; 1919, 81, \$16,935,000.

Education. The educational problems of Kentucky are unusually difficult because of the isolation of many of its communities and the difficulty of administering to their needs through schools. Nevertheless, progress was made during the decade 1913-23. The Legislature enacted, during this period, many important laws. In 1919 a measure created a survey commission, providing for a State educational survey to be made by five persons. The services of experts, under the employ of the General Education Board, were secured, and more than 18 months were spent in making the survey, which greatly increased public sentiment for the improvement of educational facilities. The General Assembly in 1920 enacted many wise and progressive measures, among them laws increasing the salaries of teachers and county superintendents and providing means by which money should be provided, a compulsory education law compelling children between the ages of 7 and 16 years to attend school; and a law providing for health education in schools. The most important of all, however, was the county school administration law, creating a county board of education elected by the people and having the power to fix the rate of the school levy and to appoint a county superintendent. In 1918 the minimum salary for teachers was made \$45 a month, and in 1920 this was increased to \$75 a month. There was steady growth in the development of high schools. In 1916 there were 149 with an enrollment of 18,850; in 1921, 225 with an enrollment of 25,939. The junior high school movement also made considerable progress. Enrollment in the schools has steadily increased. The total enrollment in the schools in 1914 was 517,299; in 1922-23 it was approximately 590,000. Expenditures for schools increased from \$8,318,640 in 1917-18 to \$13,615,133 in 1921. The percentage of illiterates decreased from 14.5 in 1910 to 10.6 in 1920: among the native white population, from 12.8 to 9.2; among the foreign-born whites, from 8.2 to 7.5; among the Negroes, from 34.7 to 26.4 per cent.

Finance. See STATE FINANCES.

Political and Other Events. The political control in Kentucky in the decade of 1914-24 was, on the whole, Democratic, but the Republicans made gains in certain years and elected their candidates. In this year two United States Senators were elected, one to fill the unexpired term of Senator Bradley, deceased, and the other for the full term beginning Mar. 4, 1915. J. N. Camden was elected to fill out the term of Senator Bradley, while J. C. W. Beckham was elected for the full term. Both were Democrats. In 1915, when A. O. Stanley was elected governor, the Democrats retained all the offices except one. James P. Levine, Republican, was elected Secretary of State. In 1916 the Repub-

licans made a strong effort to carry the State but were unsuccessful. In the presidential voting of this year President Wilson received 269,990 votes; Charles E. Hughes, 241,854. On Sept 4, 1916, the Lincoln Memorial at Hodgenville, built over the log cabin birthplace of Abraham Lincoln, was formally presented to the nation by the Lincoln Farm Association; the speech of acceptance was delivered by President Wilson. On Nov 5, 1917, the United States Supreme Court declared unconstitutional a race segregation ordinance passed by the city of Louisville in 1914. At the election held in November, 1917, Charles H. Morris was elected attorney general without opposition. In 1918 elections were held for United States Senator, and Gov. A. O. Stanley was elected, defeating B. L. Bruner, the Republican candidate. In the elections for governor and other State officers in 1919, the Republicans came into control and elected their candidate for governor, E. P. Morrow. The Democrats nominated Gov. J. D. Black. Elections were held in 1920 for United States Senator, and in this the Republicans were again successful, electing their candidate, R. P. Ernst, who defeated J. C. W. Beckham, a candidate for reelection. In the presidential voting of this year, J. M. Cox received 456,497 votes; W. G. Harding, 452,480. In 1923 the Democrats regained power, electing as governor William J. Fields.

Legislation. The Legislature of Kentucky meets biennially, in even years. In 1914 a resolution providing for woman suffrage was defeated. The Legislature of 1916 created a Workmen's Compensation Board, and passed several important laws relating to the regulation of the liquor traffic. In 1917 a modern tax law was enacted. The Legislature in 1918 ratified the Federal prohibition amendment and provided for a State bar examination. In 1919, State-wide prohibition was adopted. In 1920 the child labor laws were amended, a State department of roads and highways was created, a prohibition enforcement act was passed, a measure providing for the suppression of mob violence and the prevention of lynching was enacted, the State school system was modernized, a Department of Charities and Correction was created, a provision was made for physical education and training in the public schools, the election laws were amended, and provisions were made for a State tuberculosis sanatorium. In 1922 a State cooperative marketing act was passed. In 1924 the Legislature passed a law requiring daily readings from the Bible in the public schools, restored the forestry department, and created a State park commission.

KENTUCKY, UNIVERSITY OF. A coeducational State institution at Lexington, Ky., founded in 1858. The enrollment increased from 1245 in 1914 to 1793 in 1923-24, faculty members from 75 to 165, and the library from 30,000 to 54,118 volumes. During the same period the income increased from \$400,000 to \$1,334,269. The courses in economics, sociology, botany, zoölogy, music, art, and agriculture were enlarged, courses in public health and hygiene were established, and a new College of Education created in 1923. The administration building, Neville Hall, and White Hall were remodeled during the decade; a men's dormitory and a stock-judging pavilion were built, and work was begun on a large addition to the chemistry building and a gymnasium. A gift of 15,000

acres from the E. O. Mountain Fund in 1923 provided opportunity for experiment in reforestation, horticulture, farming, and stock-raising in the mountains of eastern Kentucky. Frank Le Rond McVey, Ph.D., LL.D., succeeded Henry Stiles Barker, LL.D., as president in 1917.

KENYA COLONY AND PROTECTORATE. A British crown colony in Africa, formerly known as the East Africa Protectorate, but after July, 1920, as the Kenya Colony. The protectorate is a strip of territory along the coastline 10 miles broad, leased from the Sultan of Zanzibar. The area is about 245,000 square miles; the population, in 1921, was estimated at 2,376,000, of whom 9651 were Europeans, 22,822 Indians, and 10,102 Arabs. The largest city, Mombasa, had a population of 32,000 in 1921; the capital, Nairobi, 24,000. Most of the highland area suitable for white settlers was preempted by 1921. The land was being sown in maize and coffee in increasing quantities, while live-stock, breeding, dairying, etc., were coming in for more and more attention. The colony continued to prosper; imports and exports increased steadily from 1914 on, except for a passing setback in 1919-20. In 1913-14, imports were valued at £2,147,937; in 1920-21, they were £6,911,858, but dropped to £2,871,240 in 1922. In 1913-14 exports were £1,482,876, while in 1920-21 they were £5,060,920, and in 1922, £2,780,998. Shipping, however, dropped from 3,565,795 tons entered and cleared in 1913-14 to 1,404,391 tons in 1920-21. Leading exports were hides and skins, grain, copra, coffee, and fibre. In 1920-21, 51 per cent of the import value came from the United Kingdom, 26.4 per cent from British possessions, 8.2 per cent from the United States; 58 per cent of the export value went to the United Kingdom, 29 per cent to British possessions, 5 per cent to France, 1.5 per cent to the United States. Revenues and expenditures mounted during the period after 1914. In 1913-14 revenues were £1,133,798 and expenditures, £1,115,899; in 1922, £1,649,032 and £1,972,212; in 1923 (estimate), £1,784,662 and £1,757,028. The State railway, by 1922, had been increased to 618 miles. The annual railway surplus, beginning with 1920, was devoted to the railway construction fund. A new line from Nakuru to Turbo, 100 miles north of the main railway, was projected in 1919. In connection with the trade figures above, it should be noted that in 1917 Uganda (q.v.) and Kenya were united in a customs union.

History. In 1920 this protectorate, formerly known as the East Africa Protectorate, was changed to a crown colony with the name Kenya Colony and placed under the British Colonial Office. The year before, in July, 1919, a measure of self-government was granted the territory when Europeans were permitted to elect 11 members to the Legislative Council; Indians were to be represented by two nominated members, and Arabs by one. The government maintained its ascendancy by reserving the right to nominate enough members of the council to assure its control. Kenya became the storm centre of a famous controversy, reverberations of which soon were to be heard all over the British Empire. From 1896 on, Indians had come to the country in increasing numbers in the rôles of money lenders, traders, and artisans, so that after the War there were 22,822 of them to 9561 Europeans. The restrictions placed on

them by the whites were onerous. In particular, Indians in Kenya objected to the reservation of the Highlands for Europeans; commercial and residential segregation in the towns; the limited franchise; and restrictions on Indian immigration. The Indian position derived strength from the significant resolution passed by the 1921 Imperial Conference, favoring citizenship for Indians in the Empire. The question was whether the Indians were to be recognized as citizens of the Empire or as a subject race. With what seemed a good deal of casuistry, the Europeans maintained on their side that the colony was a trust ruled only in the interests of the native blacks and that therefore the character of the ruling population did not matter much. Disagreement, continuing until 1923, became daily more bitter. A programme of 1923 which included a further extension of the franchise for Indians, based on a white majority of seven to four, and the abandonment of segregation and embargo on immigration, pleased neither side. The danger of open violence now spurred the British government to action. A conference was called, and the Colonial Office decided to compromise by establishing the principle of an Imperial trusteeship, based on neither European nor Indian self-government. The settlement, as finally effected, called for a communal franchise with five elected Indians and 11 Europeans, though with the official majority retained; the continuance of immigration regulations then in existence; the reservation of the Highlands for Europeans; the abolition of all segregation. Whether the plan pleased the Kenya Indians it was difficult to say, for they gave no sign; but the storm of disapproval which it aroused in India was significant. No further action was taken, in view of the fact that the 1923 Imperial Conference promised a reopening of the Indian immigration question at the future Conference on crown colonies.

KENYON, WILLIAM SQUIRE (1869-). An American jurist (see VOL. XIII). He was elected United States senator from Iowa in 1911 and was successively reelected. He served until 1921, when he resigned following his appointment by President Harding as judge of the United States Circuit Court. While in the Senate he was leader of the so-called "farm bloc" and was an aggressive supporter of progressive legislation.

KENYON COLLEGE. An institution at Gambier, Ohio, founded by Philander Chase, first bishop of the Protestant Episcopal Church in Ohio, and incorporated in 1824. The corporation maintains two schools, an undergraduate college for men and a divinity school known as Bexley Hall. At the college the student enrollment increased from 136 in 1914 to 251 in 1923, the faculty from 14 to 23, and the library from 27,000 to 30,000 volumes. In 1923 the divinity school had five professors, 18 students, and a library of 13,000 volumes. The endowment was increased from \$520,000 in 1914 to \$1,400,000 in 1923; \$600,000 was raised in 1921. Of the endowment \$210,000 was specifically designated for the work of the divinity school and \$925,000 for the college proper. In 1923 a new college dormitory costing \$200,000 was in process of construction. The completed building was to house 100 students and to be called Leonard Hall in honor of the bishop of Ohio. A central heating plant was also in process of

construction. President, the Rev. William F. Peirce, L.H.D., D.D., LL.D.

KERAK. See TRANSJORDANIA.

KERENSKY, ALEXANDER (1881-). A Russian Socialist politician, born at Simbirsk, and graduated in law from the University of Petrograd. He practiced law in Petrograd for some years. During the troubles in Turkestan he published a strong attack against the government of the affected districts. He was an impassioned and forceful speaker and became a leader in the Fourth Duma in 1917, largely because of this ability. After the overthrow of the Czar, Kerensky held many important positions in the new Socialist government which was opposed to the radical element, later known as Bolsheviks. He was minister of justice in the Lvov ministry and later premier with the portfolio of minister of war. While holding the latter position he attempted to reorganize the Russian army and make it a potent factor again in the struggle against the Central Powers. He was hampered on every side by the activities of the Bolsheviks and disgruntled military leaders. In September, 1917, Kerensky was able to crush an abortive revolt led by General Kornilov, but by November 1, he was driven from power by the Bolsheviks under the leadership of Lenin and Trotsky. After his downfall he visited many of the capitals of Europe and carried on anti-Bolshevik propaganda. Kerensky was the President of the ill-fated Russian Republic set up shortly after the revolution of March, 1917. See RUSSIA, *History*.

KERR, ALFRED (1867-). A German critic, born at Breslau. He edited the magazine *Pan*, and his published works include: *Brentanos Jugendgedichte* (1894); *Godwin, ein Kapitel Deutscher Romantik* (1898); *Herr Sudermann, a satire* (1904); *Schauspielkunst* (1904); *Davidson's: das Neue Drama* (1904); *Die Harfe* (1918); *Die Welt im Drama* (1918); and *Die Welt im Licht* (1920).

KERR, JAMES MANFORD (1851-). An American legist, born near Tippecanoe City, Ohio, and educated at the National Normal University, Lebanon, Ohio. He began to practice law in Ohio in 1877 and thereafter in many States and in the Federal courts. He edited several law periodicals, founded *The American Law Journal*, and became editor for the Bender-Moss Company and the Bancroft-Whitney Company, law book publishers of San Francisco, Cal. His numerous writings include: *Before and at Trial* (1880); *Business Corporations* (1890); *Cyclopædic California Civil Code*, 2 vols. (1905); *Cyclopædic California Penal Code* (1906; 2nd ed., 1921); *Cyclopædic California Political Code* (1906; 2nd ed., 1921); *Cyclopædic California Code of Civil Procedure*, 2 vols. (1907; 2nd ed. 1921-22); *Kerr's Wharton on Criminal Law*, 3 vols. (1912); *California Digest*, 10 vols. (1915-17); *Biennial Supplement* (1917); *Kerr's Wharton's Criminal Procedure, with Forms*, 4 vols. (1918); and *Kerr's Pleading and Practice under the Procedural Codes*, 2 vols. (1919).

KERR, SOPHIE (MRS. SOPHIE KERR UNDERWOOD) (1880-). An American novelist, born at Denton, Md. She was educated at Hood College, Frederick City, Md., and at the University of Vermont. She began to write stories at 18 years of age and did newspaper work in Pittsburgh, Pa., for a few years, and then came to New York City, where she was managing editor of the *Woman's Home Com-*

panion. She contributed stories to practically all the major magazines in the United States. Her novels include: *Love at Large* (1916); *The Blue Envelope* (1917); *The Golden Block* (1918); *The See-Saw* (1919); *Painted Meadows* (1920); and *One Thing Is Certain* (1922). *The Blue Envelope* and *The Golden Block* are stories of businesswomen, written in the natural, straightforward style that distinguishes Sophie Kerr's work as a whole.

KEUTGEN, FRIEDRICH W. E. (1861-). A German historian and professor of history at the university of Hamburg. He was born at Bremen and studied at Giessen, Göttingen, and Strassburg. He was lecturer at Johns Hopkins University in Baltimore in 1904-05, and organized and became lecturer at the Kolonial Institut in Hamburg in 1910. He has written: *Die Hansa in England im Vierzehnten Jahrhundert* (1890); *Die Aufgabe der Genealogie* (1899); *Der Grosshandel im Mittelalter* (1902); *Handelsgeschichtliche Probleme* (1904); *Britische Reichsprobleme und der Krieg* (1914); *Entstehung des Britischen Weltreichs* (1915); *Das Britische Kolonialreich* (1916); and *Der Deutsche Staat des Mittelalters* (1918).

KEY, PIERRE VAN RENSSLAER (1872-). An American editor, born at Grand Haven, Mich., and educated privately and at the Chicago Musical College. For several years he was music critic on the staff of newspapers in Chicago, and from 1907 to 1919 he was music editor of the *New York World*. In the latter year he founded and became editor of the *Musical Digest*. He contributed many articles on musical subjects to newspapers throughout the country and wrote biographies of McCormack and Caruso.

KEYES, FREDERICK GEORGE (1885-). An American physical chemist, born at Kingston in Canada, and educated at Rhode Island College and Brown University. After teaching chemistry at Brown, he went to the Massachusetts Institute of Technology as research associate in physical chemistry in 1909. During 1913-16 he was chief engineer of the Cooper Hewitt Electric Company and then returned to the Institute of Technology, where in 1919 he took the advanced rank of director. His own researches have included important papers on equilibrium measurements, gas and liquid phase, thermodynamic properties of ammonia, and low temperature in connection with the kinetic theory of development, which he has published in technical journals. During the War he was director of the research and control laboratory of the Chemical Warfare Service at Puteaux.

KEYNES, JOHN MAYNARD (1883-). An English economist and publicist. He was educated at Eton and Cambridge and then became a civil servant. From 1915 to 1919 he was in the Treasury and acted as its principal representative at the Paris Peace Conference, where his work gave him world-wide distinction. Among the first to protest against the rigorous provisions of the reparations clauses of the Versailles Treaty, in season and out he castigated the attempt to shackle German industry. Toward this end he wrote *Economic Consequences of the Peace* (1919) and *A Revision of the Treaty* (1922). A chapter of the former contained the now famous vitriolic attack on the visionary character of President Wilson's programme. Other writings included *A Treatise on Probability* (1921) and *Money and Foreign Ex-*

change (1923). He was fellow and bursar of King's College at Cambridge, editor of *The Economic Journal* since 1912, chairman of the National Mutual Life Assurance Society, and chairman of *The Nation* since 1923. His economic and financial articles appeared from time to time in the *New York World* and the *New Republic*.

KEYSER, CASSIUS JACKSON (1862-). An American mathematician and philosopher (see Vol. XIII). His works published after 1914 include *The Human Worth of Rigorous Thinking* (1916) and *Mathematical Philosophy, a Study of Fate and Freedom* (1922).

KEYSERLING, HERMANN ALEXANDER, GRAF VON (1880-). A leading German social philosopher, born at Kónno in Livonia. His family came from the wealthy German-speaking nobility of Baltic Russia. After his education at the universities of Dorpat, Heidelberg, and Vienna, he took a trip around the world. He interested himself in natural science and in philosophy, and before the War he was known both as a student of geology and as a popular essayist. The Russian Revolution deprived him of his estate in the Baltic, and with the remains of his fortune he founded the Gesellschaft für Freie Philosophie (Society for Free Philosophy) at Darmstadt. The mission of this school was to bring about the intellectual reorientation of Germany. Although not a doctrinaire pacifist, Keyserling believed that the old German policy of militarism was dead for all time and that Germany's only hope lay in the adoption of international, democratic principles. His political and social writings include: *Europas Zukunft* (1918); *Deutschlands Wahre Politische Mission* (1919); *Was Uns Not Tut und Was Ich Will* (1919); *Peace or War Everlasting* (1920); and *Politik, Wirtschaft, und Weisheit* (1922). His more speculative writings include: *Das Reisetagebuch einer Philosoph* (1919), *Philosophie als Kunst* (1920), and *Weisheit und Sinn* (1922).

KIAOCHOW. See SHANTUNG; JAPAN, *History*.

KIDNEY DISEASE. See NEPHRITIS.

KILLIAN, GUSTAV (1860-1921). A German laryngologist, born in Mainz, and educated at the University of Freiburg-im-Breisgau. He made revolutionary advances in the diagnosis and treatment of affections of the infralaryngeal passages, especially in the diagnosis and removal of foreign bodies in the bronchial tubes, by means of his new art of bronchoscopic control. His first college appointment was as assistant to Professor Hack of the chair of otolaryngology in Mainz. The sudden death of Hack led to his succession by Killian, although he was not made professor at the time. His revolutionary activity in bronchoscopy gained him an appointment as professor of laryngology in the University of Berlin; this was the first professorship of such scope in Germany. Killian introduced another innovation known as suspension laryngoscopy into the technic of his specialty. He wrote no monograph on the bronchoscope, and the omission has been supplied by his pupils. His book, *Die Schwebelaryngoscopie*, appeared in 1920; in collaboration with Voss was written a volume on military experience, *Gehörorgan, Obere Luft und Speisengänge* (1921). A Festschrift volume was published in 1920.

KILMER, JOYCE (1886-1918). An Ameri-

can journalist and poet, born in New Brunswick, N. J. Following his graduation from Rutgers College and studies at Columbia University, he taught for a time and then entered newspaper work in New York City. He contributed to many newspapers and magazines on many subjects, but he was chiefly distinguished for his verse and was recognized as one of the most prominent of the younger American poets. At the outbreak of the War, he enlisted as a private in the 116th Infantry (69th New York), and in August, 1918, was killed in the course of the American advance which drove the Germans from the Marne salient. His books include *Summer and Love* (1911); *Trees, and Other Poems* (1915), and *Main Street, and Other Poems* (1915).

KIMBALL, (SIDNEY) FISKE (1888-). An American architectural author, born at Newton, Mass., and educated at Harvard University and in Europe. He was assistant in Harvard and instructor at the University of Illinois from 1909 to 1913. In the latter year he was appointed instructor in architecture at the University of Michigan and was later assistant professor of architecture and assistant professor of fine arts there. In 1919 he became professor of art and architecture at the University of Virginia. He wrote much on architectural subjects and in 1916 became an editor of *Art and Archaeology*. He designed the McIntire Amphitheatre in West Virginia and many other buildings. He lectured at the Metropolitan Museum and the University of Chicago and was a member of many architectural and other societies. His writings include *Jefferson and the First Monument of the Classical Revival* (1915); *Thomas Jefferson, Architect* (1916); *A History of Architecture*, with G. H. Edgell (1918); and *Domestic Architecture of the American Colonies* (1922). He also contributed to literary and art magazines.

KINDERGARTEN ASSOCIATION, NATIONAL. The object of this organization is to provide kindergarten training for all the nation's children. It was established in New York in 1909 at a time when statistics showed that only one child in nine received kindergarten education and that 4,000,000 children were deprived of this privilege every year. The need was recognized for an organization to educate boards of education as to the value of kindergarten training. From its beginnings the Association interested itself in securing legislation requiring the organization of kindergartens on petition, and laws to this effect were secured in nine states: Nevada, Arizona, New Mexico, Texas, Pennsylvania, Kansas, Wisconsin, Illinois, and Maine. Through its field representatives, the Association established 502 new kindergartens, located in 322 towns and training 209,734 children; of this number 65 new kindergartens were organized in 1923. In 1913 the Association assisted the United States Bureau of Education in conducting a Kindergarten Division, compiling important statistics of kindergartens, and completing a careful survey of schools for training kindergarten teachers, the results of which were published in bulletins of the Bureau of Education. After 1917 it coöperated with the Bureau in preparing articles on home education which were sent to papers and magazines in this and many foreign countries. Its work was instrumental in arousing an active interest in early

education among the members of important national societies with a view to overcoming the existing indifference toward the extension of early training for children. The Association also coöperated with branches of the International Kindergarten Union, an organization made up of kindergarten teachers; in 1912 it affiliated with the National Kindergarten and Elementary College of Chicago. The movement was supported by voluntary gifts and expended about \$15,000 annually. Headquarters were maintained in New York City.

KING, (WILLIAM BENJAMIN) BASIL (1859-). An American author (see Vol. XIII). His later books are *The Side of the Angels* (1916); *The High Heart* (1917); *The Lifted Veil* (1917); *The City of Comrades* (1919); *The Abolishing of Death* (1919); *The Conquest of Fear* (1921); *The Discovery of God* (1922); *Dust Flower* (1922); and *The Happy Isles* (1923).

KINSMAN, FREDERICK JOSEPH (1868-). An American clergyman, educated at St. Paul's School at Concord, N. H., and at Keble College, Oxford. He was Protestant Episcopal bishop of Delaware from 1908 to 1919 but resigned to become a Roman Catholic and was appointed professor of modern church history in the Catholic University at Washington. He wrote: *Principles of Anglicanism* (1910); *Prayers for the Dead* (1914); *Issues before the Church* (1915); *Outlines of the History of the Church* (1916); *Catholic and Protestant* (1918); *Salve Mater* (1920).

KIPLING, (JOSEPH) RUDYARD (1865-). An English novelist and poet (see Vol. XIII). During the War he wrote much on subjects connected with the British army and nation. He wrote *New Armies in Training* (1914), *Sea Warfare* (1916); *A Diversity of Creatures* (1917); *The Years Between* (1918); *Inclusive Verse* (1919); and *Letters of Travel* (1920). His only son, Joseph Lockwood Kipling, was killed in the War.

KIRCHEISEN, FRIEDRICH MAX (1877-). A German historian, born at Chemnitz. He studied history and international law at the Universities of Leipzig and Paris and specialized in the Napoleonic era. He also distinguished himself by his geographical and literary researches. His writings include a bibliography on Napoleon which was published in German, English and French (1902); *Die Schriften von und über Friedrich von Gentz* (1906); *Napoleon: Auswahl aus Seinen Aussprüchen* (1907); *Hat Napoleon Gelebt?* (1910); *Napoleon, Sein Leben und Seine Zeit* (1914); *Napoleon im Lande der Pyramiden* (1918); *Auswahl aus J. J. Rousseaus Briefen* (1908); *Memoiren aus dem Spanischen Freiheitskampfe* (1908); *Arndt, Erinnerungen* (1908); *Gedichte* (1913); *Der Völkerring* (1915-17); and *Die Schlacht an der Marne* (1915).

KIRCHWEY, GEORGE WASHINGTON (1855-). An American legal scholar (see Vol. XIII). In 1915-16 he served as warden of Sing Sing Prison and from 1917 was head of the Department of Criminology of the New York School of Social Work. He resigned as Kent Professor of Law at Columbia in 1916. He served on various committees investigating prisons and in 1918-19 was director of the United States Employment Service. In 1917 he was president of the American Peace Society, as well as president of the American Institute

of Criminal Law and Criminology in the same year.

KIRGHIZ AUTONOMOUS SOCIALIST SOVIET REPUBLIC. See **SIBERIA AND THE FAR EASTERN REPUBLIC.**

KITCHENER, HORATIO HERBERT, first **EARL OF ("KITCHENER OF KHARTUM")** (1850-1916). A famous British soldier and administrator (see **VOL. XIII**). When England entered the War, Kitchener was at home on leave from Egypt and was appointed Secretary of State for War. He built up a great army of over 2,000,000 men. Having undertaken to help in the arming of Russian forces, he sailed from Scapa Flow, on June 5, 1916, to consult with the Czar. His ship struck a mine off the Orkneys, and he and most of his staff were drowned.

KITTREDGE, GEORGE LYMAN (1860-). An American philologist (see **VOL. XIII**). He has been professor at Harvard for many years and is a very prolific author. His later works include: *Chaucer and His Poetry* (1915), *Gavain and the Green Knight* (1916), *Shakespeare* (1916), *Concise English Grammar*, with F. E. Farley (1918), and *Dr. Robert Child, the Remonstrant* (1919).

KLAGENFURT BASIN. This region on the southern boundary of the Austrian Republic in the basin of the Drave, with an area about 1200 square miles, was one of the districts most stubbornly contested in the making of the peace. Although the whole region is a political and economic unit, since the valley of the Drave, enclosed by highlands, here widens out into a long corridor, its disposition nevertheless presented a peculiar problem, for the northern side of the valley was peopled by German Austrians and the southern by Slovenes. Its total population was about 150,000, the majority Slovenes but of no pronounced Slavophil sympathies; Klagenfurt, the town, had 28,958 inhabitants (1910), 25,582 of whom were Germans. The failure of the Austrian armistice terms to fix an occupation line for the province of Carinthia, and the desire of the Jugo-Slavs to push their boundaries as far north as possible, made this region the scene of turmoil and bloodshed for more than six months after the actual close of war. Sporadic fighting went on up to April, 1919, and then, in the following month, strong bands of irregular Jugo-Slav troops, strengthened by Serb detachments, pushed into the Basin, seized large stores of war materials, and occupied at least two-thirds of the area as well as the town of Klagenfurt. This turn of affairs compelled the Peace Conference to take action. On May 31 the cessation of hostilities and evacuation were ordered, and though an armistice was signed a week later, the state of war continued, with the Jugo-Slavs in actual possession. Because of the bitterness which had been aroused on both sides by this time, no solution but the holding of a plebiscite could present itself to the Peace Conference. Article 50 of the Treaty of St Germain of Sept. 10, 1919, therefore made provision for the dividing of the basin into two zones, A and B. In the southern and larger zone (A), a plebiscite was to be held first, and the disposition of the whole region was then to be thus determined by the vote in this zone: in the event of a favorable Jugo-Slav vote, A was to go to Jugo-Slavia and a plebiscite was to be held in B; in the event of a favorable Austrian vote the whole was to go to Austria without further action. An inter-Allied com-

mission took charge of Zone A on July 21, 1920, and on Oct. 10, 1920, the voting took place. In spite of the fears entertained by Austrians for the loss of the district because of the predominantly Slovene population, about 70 per cent, and the fact that Jugo-Slavs had administered the zone from September, 1919, the vote was in favor of Austria; 22,025 ballots were cast for the Republic and 15,279 for Jugo-Slavia. The Basin, therefore, reverted to Austria. The considerations determining the result were probably the slight cultural affinity between the Slovenes of the region and their fellows to the South, distaste for military service in the Jugo-Slav army, and more important, the economic factor. Klagenfurt, in Zone B, was the market and railway outlet of the whole Basin, and with its market cut off by boundary lines the natives would have been compelled to ship their produce to Laibach, a distance of 60 miles across the Karavanke mountains.

KLIMKE, FRIEDRICH A. (1878-). An Austrian Jesuit. He was born at Golleow and studied classical philology at the university of Cracow. He became professor of philosophy and of the history of philosophy at the Universities of Cracow and Innsbruck and was later called to the Gregorian University in Rome. His writings include: *Der Deutsche Materialismusstreit im Neunzehnten Jahrhundert* (1907); *Der Mensch* (1908); *Hauptprobe der Weltanschauung* (1910); *Der Monismus und Seine Philosophischen Grundlagen* (1911); *Monistische Einheitsbestrebungen in der Katholischen Weltanschauung* (1912); *Monismus und Pädagogik* (1918); *Unsere Sehnsucht* (1922). Some of his works were published simultaneously in German and Polish.

KLOTZ, OTTO JULIUS (1852-). A Canadian civil engineer and astronomer (see **VOL. XIII**). He was chairman of the National Committee of Canada of the International Astronomical Union in 1920, president of the American Seismological Society during 1920-21, and delegate for Canada at Rome at the International Astronomers' Union in 1922.

KLUCK, ALEXANDER VON (1846-). A German general (see **VOL. XIII**). He led the campaign of the Marne in 1914, was wounded in 1915, and retired in the following year. General von Kluck wrote of his participation in the War in the volume entitled *Führung und Taten der Erste Armee* (1920).

KNAPP, BRADFORD (1870-). An American agricultural educator, born at Vinton, Iowa, and educated at Vanderbilt University and in law at the University of Michigan. For several years he practiced law in Iowa and until 1911 was engaged in cooperative demonstration work for the Bureau of Plant Industry. In 1911 he was appointed special agent in this bureau and from 1915 to 1920 was chief of the Office of Extension Work in the South for the States Relations Service of the United States Department of Agriculture. In 1920 he became dean of the College of Agriculture of the University of Arkansas and director of the State Experiment Station. Professor Knapp wrote *Safe Farming, How the Whole Country Demonstrated*, and publications for the United States Department of Agriculture.

KNEISEL QUARTET. See **Music, Chamber Music.**

KNIGHTS OF COLUMBUS. A Roman Catholic, fraternal and benevolent society

founded in 1882. On Jan. 1, 1924, there were 2368 subordinate branches of the society, with 229,333 insured and 542,622 associate members. During the War this organization was active in work among the men in the army, navy, and marine forces of the United States. In 1918, 150 Knights of Columbus buildings were opened in camps in the United States and 45 huts in France. The buildings were equipped with chapels, libraries, writing desks, lounges, fireplaces, player pianos, phonographs, billiard tables, games, many kinds of stage apparatus, moving-picture machines, and other things necessary for the comfort of service men. There were 350 secretaries and 100 chaplains in charge of the work in the United States and 175 secretaries and 40 chaplains overseas. Cigarettes, cigars, smoking tobacco, pipes, chewing gum, razors, shaving cream, shaving brushes, tooth paste, tooth brushes, and many other articles were distributed by the Knights of Columbus free to enlisted men.

After the Armistice the organization opened technical schools in the larger camps, extending free instruction to those in the service. In 1919, 20,000 officers and men were receiving instruction in law, commercial science, technical subjects and modern languages. The following year the schools were extended to the larger cities of the country until 150 schools were in operation with an enrollment of 99,310 in 80 different courses. Correspondence course instruction was extended to ex-service men not able to attend the evening schools in the larger cities. In January, 1924, there were 25,000 students actively enrolled and submitting lessons for correction. In 1919, 411 college scholarships were awarded to men who rendered service with the army, navy, and marines during the War. Employment centres were opened during the demobilization period in all large cities throughout the country, and positions were found for 175,000 ex-soldiers. \$38,000,000 was spent by the Knights of Columbus for educational and welfare activities for men in the army, navy, and marine forces of the United States during the War. In 1921 the Supreme Council voted to establish an endowment fund of \$1,000,000 to finance welfare work in Italy, undertaken at the request of the late Pope Benedict XV, and in 1924 it established three large and completely equipped playgrounds in Rome. A papal medal was struck to commemorate the occasion.

KNIT GOODS. See TEXTILE MANUFACTURING.

KNOX, PHILANDER CHASE (1853-1921). An American lawyer and statesman (see Vol. XIII). He was reelected to the Senate in 1916 for the term ending 1923. He took a prominent part in debates on the Versailles Treaty and the Covenant of the League of Nations and was the author of the Knox Resolutions, which proposed the repeal of the joint resolution of Apr. 6, 1917, declaring the existence of a state of war with Germany, and in its place the declaration that the state of war was at an end, on the condition that the United States should have possession of the property of the German government in the United States, and of its subjects, until a treaty should be ratified. This resolution was defeated. Senator Knox was one of the chief opponents of the treaty in the Senate. He died Oct. 12, 1921.

KNOX COLLEGE. A coeducational institu-

tion at Galesburg, Ill., founded in 1837. The student enrollment increased from 340 in 1913-14 to 580 in 1923-24, the faculty was increased from 26 to 48 members, and the library from 10,000 to 26,413 volumes. The productive funds were increased correspondingly from \$402,601 to \$1,426,139 and the yearly income from \$53,851 to \$180,318. Seymour H. Ill, a men's dormitory, union, and commons, costing \$150,000, was erected in 1921. The college adopted a policy of owning all fraternity houses, which are leased for a long term to the fraternities. Two new fraternity houses were built, and another was to be begun in 1924; three large residences were made over for fraternity purposes. President, James L. McConaughy, Ph.D.

KOEHLER, WOLFGANG (1887-). A German psychologist, born at Reval in Esthonia, and educated at the Universities of Tübingen, Bonn, and Berlin. After teaching in German schools, he found himself during the War at an anthropoid research station in German South Africa. There he conducted investigations on the perceptive capacities of chimpanzees and apes. After the War he was professor at the University of Berlin. On leave of absence in 1924, he lectured at Clark University. His researches in animal psychology led Koehler to become one of the leaders of the new school of German psychology known as the *Gestaltpsychologie* or psychology of forms. His published work comprises, in addition to a number of monographs, a remarkable volume on *Die Physischen Gestalten in Ruhe und im Stationären Zustand* (1920).

KOESTER, FRANK (1876-). An American engineer, born at Sterkrade, Germany. He received a thorough training in his profession in Germany and then came to the United States in 1902. His first engagement was with the New York Subway Construction Company, after which he served as engineer with the Guggenheimer Exploration Company, the American Smelting and Refining Company, and similar corporations. In 1911 he entered consulting practice in New York City and was lighting expert for Allentown, Scranton, and other cities in Pennsylvania. Besides patenting numerous improvements in plant engineering, he has written many articles for technical journals on his specialties and is the author of *Steam Electric Power Plants* (1908), *Hydroelectric Developments and Engineering* (1909), *Electricity for the Farm and Home* (1913), *The Price of Inefficiency* (1913), *Modern City Planning and Maintenance* (1914), and *Secrets of German Progress* (1915).

KOFFKA, KURT (1886-). A German psychologist, born at Berlin, and educated at the University of Berlin and at Edinburgh. He became professor of psychology at the University of Giessen and founded the periodical, *Psychologische Forschung*, with a new orientation for experimental psychology. His published writings include: *Experimentaluntersuchungen zur Lehre vom Rhythmus* (1908); *Ueber Vorstellungen* (1911); *Zur Analyse der Vorstellungen und ihrer Gesetze* (1912); *Beiträge zur Psychologie der Gestalt* (1919); and *Die Grundlagen der Psychischen Entwicklung* (1921).

KOLCHAK, VLADIMIR VASILIEVITCH 1874-1920). A Russian admiral and soldier. He entered the navy in 1891 and was commissioned an officer in 1894. During the Russo-Japanese

War, he greatly distinguished himself in the defense of Port Arthur and for this received many decorations. From 1906 to 1916 he was on the general staff of the navy and took an active part in the organization of that branch of the service. During the War he displayed distinguished military gifts, and his personal gallantry won him a series of awards and promotions. He became rear-admiral in 1916. He was given an independent command in the Baltic and was promoted to be vice-admiral and commander of the Black Sea Fleet. Following the Revolution in 1917, he became an anti-Bolshevik leader, and his brilliant successes at first rapidly gained him virtual leadership. In 1919, however, he gradually lost ground, and at the end of that year, following brief successes, he was obliged to retire across the Irtysh River, where he lost his guns and supplies. He withdrew with his forces to Vladivostok, where, in January, 1920, an anti-Kolchak revolution broke out. On June 24, he surrendered to the revolutionary forces at Irkutsk and was executed. See RUSSIA, *History*; SIBERIA, *History*.

KONTI, ISIDORE (1862-). An American sculptor (see VOL. XIII). Among his later works, in his refined and decorative manner, were a fountain in Audubon Park in New Orleans, the memorial to Bishop Potter in St. John's Cathedral, New York City, and an ideal work in bronze, "The Genius of Immortality," in the Metropolitan Museum, New York City.

KOREA, OR CHOSEN. A dependency of Japan, occupying the peninsula on the mainland of Asia opposite the main island of Hondo. Area, 85,228 square miles, 82,926 being on the mainland and 2,302 in neighboring islands. In 1921 the native population was 17,059,358 (13,947,474 agricultural); the Japanese population, 367,618. The principal cities were Seoul, 261,698 (188,648 Korean, 69,774 Japanese); Pyongyang, 78,621 (60,086 Korean, 17,731 Japanese); Fusan, 76,126 (41,902 Korean, 33,979 Japanese); Taiku, 46,043 (33,213 Korean, 12,515 Japanese); Chemulpo, 39,990 (26,516 Korean, 12,095 Japanese); Kaisong, 37,592 (36,242 Korean, 1201 Japanese); Gensan, 29,768 (21,532 Korean, 7620 Japanese); Chinampo, 22,667 (17,116 Korean, 5026 Japanese).

Agriculture. Rice was the principal agricultural product; 76,018,392 bushels were produced in 1918, 14,880,000 of which were exported to Japan, the balance being consumed locally. In 1913, 60,327,321 bushels were produced. Other products were: barley, 28,556,547 bushels in 1918 and 25,973,281 in 1913; millet, 28,103,169 in 1918 and 22,709,374 in 1913; soy beans, 24,159,530 in 1918 and 17,880,317 in 1913; wheat, 6,848,647 in 1918 and 6,306,958 in 1913; silk (exported), 2,073,601 pounds in 1918 and 187,695 in 1913; ginseng, 266,093 pounds in 1918 and 185,319 in 1913, with an export of some 103,008 pounds to China in 1918; American upland cotton production, for 1921, 90,476,000 pounds, and 17,785,414 in 1913; native cotton, 36,784,000 pounds in 1921 and 34,437,462 in 1913; tobacco, 32,104,000 pounds in 1918 and 31,348,000 in 1913. Live stock resources were: cattle, 1,480,037 (40,627 cattle exported to Japan, Siberia, and China as well as 2,838,000 cowhides) in 1918 and 1,211,011 cattle in 1913; 58,217 horses (1913: 50,652); 12,172 asses (1913: 13,225); 2211 mules (1913: 802); 923,979 swine (1913: 761,186); 16,650 goats (1913: 10,456); 4,913,322 fowl (1913: 4,194,335).

Horticulture: 1,139,392 pear trees (yield 13,605,121 pounds of pears; 1913: 580,236 trees and 2,296,420 pounds); 1,420,871 apple trees (yield 14,481,726 pounds of apples, 1913: 680,144 trees and 2,930,748 pounds); 348,099 grapevines (yield 2,017,403 pounds of grapes; 1913: 243,169 and 838,598 pounds); 5,231,124 chestnut trees (yield 31,412,832 pounds of chestnuts; 1913: 1,581,270 and 33,431,116 pounds). The Oriental Development Company, a Japanese land colonization company, accepted 7035 Japanese families' applications for settlement from 1910 to 1918; of these, 3457 were successful, with 15,555 members of their families settled on 17,741 acres of land.

Mining. 1918 productions were: 135,000 ounces gold (1913: 145,000 ounces); 16,000 ounces placer gold (1913: 28,000 ounces); 66,448,000 pounds gold and silver ore (1913: 11,342,000 pounds); 43,000 ounces silver (1913: 24,000 ounces); 578,000 pounds coarse lead; 2,828,000 pounds zinc ore; 635,000 pounds tungsten ore; 199,000 tons iron ore (1913: 142,000 tons), 94,888,000 pounds pig iron; 15,523,000 pounds graphite (1913: 27,120,000 pounds); 188,000 tons coal (1913: 128,000 tons); 102,396,141 pounds salt (1913: 56,201,622 pounds).

Forestry. From 1907 to 1918, 25,618 acres had been planted with 21,198,000 trees by State and local governments; 240,443 acres were leased out for afforestation in 1918.

Fisheries. The total value of the catch in 1918 was \$16,431,701, as against \$5,528,142 in 1913. The 1918 catch consisted of 198,703,000 pounds of pollack; 147,342 pounds of sardines, 68,116,000 pounds of mackerel; 68,544,000 pounds of cod; 41,176,000 pounds of herring, 39,808,000 pounds of guchi; 24,721,000 pounds of lobster, and lesser amounts of other fish.

Manufacturing. In 1918 there were 1700 factories, employing 5 people each or more, using 26,151 horse power in all, and producing products valued at \$78,400,815. Of these, 736 were owned and operated by Japanese and 605 by Koreans. They included 297 for rice cleaning, 182 for ceramics, 163 for metal ware, 117 for brewing, and 83 for dyeing and weaving. The value of products of those owned by Japanese was \$42,200,792; by Koreans, \$4,181,876. In 1913 there were only 532 factories, of the same class, using 9908 horse power and with a production of \$18,033,086.

Foreign Trade. 1921 imports amounted to \$109,138,000, consisting principally of cotton gray sheeting (\$15,868,000), coal, lumber, machinery, cotton fabrics, Chinese hemp fabrics, petroleum, sugar, and cotton yarn. 1914 imports were \$31,615,000, consisting of gray sheeting, \$2,940,000; rice, \$1,362,000; cotton yarn, \$1,035,000; cotton fabrics, \$994,000; white sheeting, \$878,000; coal, timber, paper, flour, sugar, machinery, and petroleum. Similarly, 1921 exports amounted to \$116,190,000, consisting principally of rice, \$46,406,000; beans, \$11,433,500; raw silk, including tussah silk, \$6,522,500; iron and steel, \$4,411,000; fish, ginseng, fertilizer, cotton, gold, cow hides, cattle, paper and pulp. In 1914, exports were \$17,194,000, consisting of rice, \$12,258,000, and beans, peas, cowhides, ginseng, cotton, and leather manufactures.

Budget and Finance. Total expenditures and revenues for 1923-24 were \$72,845,000 (1913-14: \$31,546,744); total debt in March 1922, was \$92,663,000 (1916: \$36,801,000).

Twenty-one ordinary banks were in operation, with \$7,475,000 paid-up capital, in 1921, in addition to the Bank of Chosen, with \$25,000,000 capital, and the Provincial Hypothec Bank, with \$7,500,000 capital. Bank-notes of the Bank of Chosen outstanding in September, 1921, totaled \$55,443,500. Total currency in circulation was \$62,978,832. By contrast, there were 15 ordinary banks with \$1,800,000 paid-up capital in 1915, in addition to the Bank of Chosen with \$5,000,000 and six Provincial Hypothec Banks with \$739,000 capital. Bank-notes of the Bank of Chosen totaled \$12,343,000 in 1915, which was the total currency.

History. Under Japanese administration the province progressed materially. Bare hill-sides were afforested, agriculture received the benefit of scientific supervision, and railways were built. Advances were startling in every line of economic activity. But the absolute character of the Japanese authority, the dominance by the military, the refusal to heed the demands for a larger measure of popular government, all contributed to a feeling of resentment which the democratic doctrines of the War finally fanned into open hostility. Throughout 1919 there were everywhere marked evidences of unrest; means of communication were cut; cities were the scenes of mob violence; public officials were attacked and some even killed. The Japanese, on the other hand, retaliated by increasing their garrisons and by employing repressive measures. By April the riots had taken on so much of the character of actual rebellion that the Japanese privy council was spurred into action. A programme of reform introduced during the year included the extension of civil government at the expense of the military and responsibility of the governor to the Japanese Ministry. Korea was made an integral part of the Japanese Empire, and Koreans were put on the same footing as Japanese, nominally at least. Members of the former Korean dynasty and cabinet received Japanese patents of nobility. A little later, in 1920, the Korean tariff was assimilated to that of Japan. Meanwhile a revolutionary party, through a committee at Shanghai, promulgated a republican constitution for the "Provisional Government of the Korean Republic." An attempt was made to interest Soviet Russia in the struggle of the Koreans for independence, while natives and friends of Korea in other countries, especially in the United States, endeavored to show sympathy for Korean aspirations by giving publicity to numerous acts of oppression, violations of the rights of pro-Korean missionaries, summary executions of Korean patriots, etc., alleged to have been committed by the Japanese in Korea. Baron Saito, the new governor, expressed the hope that ultimately Koreans would receive all those civil and constitutional liberties which Japanese possessed, but the tenuous character of the promise hardly served to assure the natives. Disorders were thus sporadic during 1920, while the military authorities deported themselves with a marked severity. By 1924 none of the political or educational hopes of the Koreans had yet been realized.

KORNILOV, LAYE GEORGEVITCH (1870-1918). A Russian general. He entered the army in 1888 and took part with distinction in the Russo-Japanese War. He served from 1907 to 1911 as Russian military agent in China and later had various commands in Siberia. At the

beginning of the War he commanded a division of Brussilov's army with great success. He was captured during the Russian retreat in 1915 but effected his escape and reached Rumania. Returning to Russia, he commanded the 25th Army Corps. At the outbreak of the Russian Revolution in March, 1917, he became commander-in-chief of the troops in Petrograd but resigned his command on account of lack of discipline in the army and was assigned to the 8th Army. On August 1 he succeeded Brussilov as commander-in-chief and at once took strong measures for the restoration of discipline. In September, 1917, he demanded full military and civil power from Kerensky. He was thereupon dismissed and marched with his troops on Petrograd. The movement collapsed and on September 15 he surrendered. He escaped to the Caucasus, where he gathered a volunteer force of Cossacks, and was killed in March, 1918. See *Russia, History*.

KÖSTER, ADOLF (1883-). A German writer, born at Verden, and educated at the Universities of Halle, Marburg, Heidelberg, and Zurich. He was lecturer at the University of Munich, traveled in England, America, Asia and Africa, and during the War was correspondent for Social-Democratic papers. During the presidency of Wirth he was Minister of the Interior. He has written *Die Ethik Pascals* (1906); *Der Junge Kant* (1913); *Die Zehn Schornsteine* (1909); *Die Bange Nacht* (1913); *Der Tod in Flandern* (1915); *Brennendes Blut* (1916); and *Der Kampf um Schleswig* (1920).

KOWEIT. See *ARABIA*.

KRAEMER, HENRY (1868-). An American pharmacist, born at Philadelphia, Pa., educated at the Philadelphia College of Pharmacy and Columbia and Marburg Universities. He was instructor at the New York College of Pharmacy and during 1895-97 professor of botany at Northwestern University. In 1897 he accepted the chair of botany and pharmacognosy at the Philadelphia College of Pharmacy and became also director of the microscopical laboratory. These places he held until 1917, when he accepted a similar chair at Michigan, where he served also as dean. In 1920 he became director of the Kraemer Scientific Laboratory. He was editor of the *American Journal of Pharmacy*, 1898-1917, and in 1900 became a member of the committee of revision of the United States Pharmacopeia. He is the author of *A Textbook of Botany and Pharmacognosy* (1902), *Applied and Economic Botany* (1914), and *Scientific and Applied Pharmacognosy* (1915).

KRAFT, ZDENKO VON (1836-). An Austrian writer, born at Gitschin, and privately educated with special attention to drama and music. His works include: *Adagio Consolante* (1910); *Der Osterprinz, ein Sonniges Leben* (1914); *Die Stimme von Helgoland* (1916); *Sonnenwend des Glucks* (1917); *Wikings Letzte Fahrt* (1917); *Maria Theresa* (1918); *Missa Solemnis* (1920); and a trilogy of novels on the life of Wagner, *Barrikaden* (1920) *Liebestod* (1921), and *Wahnfried* (1922).

KRALIK, RICHARD VON MEYERSWALDE (1852). An Austrian writer, born at Eleonorenheim in Bohemia and educated at the universities of Vienna, Bonn, and Berlin. He is the author of many works, which include: *Vasimilian*, a drama (1885); *Deutsche Puppenspiele* (1885); *Sprache und Gesunge* (1892); *Kraka*, a comedy (1893); *Kaiser Marcus Au-*

relius in Wien, a drama (1897); *Veronica*, a drama (1898); *Rolands Tod* (1898); *Altgriechische Musik* (1900); *Angelus Silesius* (1902); *Die Deutschen Klassiker und der Katholizismus* (1903); *Weltgeschichte und Menschenalter* (1903); *Das Feilchenfest* (1905); *Die Grals-sage* (1907); *Die Revolution* (1908); *Die Katholische Literaturbewegung der Gegenwart* (1909); *Homeros* (1910); *Geschichte von Wien* (1911); *Geschichte der Neuesten Zeit* (1914-20); *Die Neue Staatenordnung* (1918), and *Grundriss und Kern der Weltgeschichte* (1920).

KRAMER, A WALTER (1890-). An American composer, born in New York City, Sept. 23, 1890. He studied violin with C. Hauser and R. Arnold, but in composition he is practically self-taught. In 1910 he joined the staff of *Musical America*, leaving in 1922 to go abroad. He has contributed to other periodicals. His compositions include a symphonic poem, *The Tragedy of Nan*; four *Sketches* for orchestra; a *Rhapsody* for violin and orchestra; a suite for string orchestras; *The Hour of Prayer* for baritone, chorus, and orchestra; a string quartet; compositions for organ and for piano; and songs.

KRAPP, GEORGE PHILIP (1872-). An American educator, born at Cincinnati, Ohio, and educated at Wittenberg College and at Johns Hopkins University. He served for several years as an instructor of English at the Horace Mann School and in Teachers' College. In 1907 he was adjunct professor of English at Columbia and from 1908 to 1910 was a professor at the University of Cincinnati. In the latter year he was appointed professor of English at Columbia. He was a member of many learned societies and author of *The Elements of English Grammar* (1908); *In Oldest England* (1912); *Pronunciation of Standard English in America* (1919); and *Tales of True Knights* (1920).

KRAUS, CHARLES AUGUST (1875-). An American physical chemist, born at Knights-ville, Ind., and educated at the University of Kansas, Johns Hopkins University, and the Massachusetts Institute of Technology, where he was a research associate in physical chemistry during 1908-12 and assistant professor during 1912-14. In 1914 he became professor of chemistry and director of the chemical laboratory at Clark University. The subjects of solutions, organic radicals, and vapor electric apparatus have received his attention. He has published the results of his investigations on these and similar subjects in the technical journals of his specialties.

KRAUS, EDWARD HENRY (1875-). An American mineralogist, born at Syracuse, N. Y., and educated at the Universities of Syracuse and Munich. During 1896-99 he was instructor in German and mineralogy at Syracuse, where he became associate professor of mineralogy in 1902, and in 1902-04 he was in charge of the department of science at the Syracuse High School. In 1904 he was called to the University of Michigan, where in 1919 he was appointed to the chair of crystallography and mineralogy, in addition to his positions of director of the mineralogical laboratory (1908-) and dean of the summer session (1915-). Besides many papers on chemical and physical crystallography and the optical constants of crystal at varying temperatures, he has written *Essentials of Crystallography* (1906); *Descriptive Mineralogy* (1911); *Tables for the Determination of*

Minerals, with W. F. Hunt (1911); and *Elementary Mineralogy*, also with Hunt (1920).

KRAUSKOPF, JOSEPH (1858-). An American rabbi, born in Germany. In 1872 he emigrated to the United States and received his degrees from the University of Cincinnati and the Hebrew Union College both in 1883. He was rabbi in Kansas City from 1883 to 1887 and went to Philadelphia in the latter year. He was the founder of the Jewish Publication Society of America and of the National Farm School. In 1898 he was appointed special relief commissioner to Cuba and was special commissioner and agricultural commissioner in Europe for several years following. In 1904-05 he was president of the Conference of American Rabbis and was an official of other societies. He wrote *The Jews and Moors in Spain*, *My Visit to Tolstoy*, *The Seven Ages of Man*, *The Service Manual*, *The Service Ritual*, and many volumes of lectures. From 1917 to 1920 he was representative of Jewish organizations in the Food Conservation Department in Washington.

KREGER, EDWARD ALBERT (1868-). An American army officer, born at Keota, Iowa, and graduated at the Iowa State College in 1890. He served in the Spanish-American War with the Iowa troops and in 1901 was commissioned first lieutenant of the Regular Army. He served in the Philippines and in Cuba. From 1914 to 1917 he was professor of law at the United States Military Academy and assistant to the Provost Marshal in 1917-18. In 1918-19 he was acting judge-advocate-general with the Army in France and was acting judge-advocate-general of the United States Army from 1919. He received the Distinguished Service Cross for heroism in action in the Philippines and the Distinguished Service Medal for distinguished service as acting judge-advocate-general.

KREHBIEL, HENRY EDWARD (1854-1923). An American music critic (see Vol. XIII). In 1917 he published *A Second Book of Operas* and in 1919 *More Chapters of Opera and Parsifal, an English Version for Performance*, which was used by the Metropolitan Opera Company.

KRESY. See *VILNA*.

KROEBER, ALFRED LOUIS (1876-). An American anthropologist (see Vol. XIII). His later publications include *Zuñi Potsherds and Hohan* (1915); *Floral Relations among the Galapagos Islands* (1916); *Zuñi Kin and Clan* (1917); *Tribes of the Pacific Coast* (1917); *The History of Philippine Civilization as Reflected in Religious Nomenclature* (1918); *Kinship in the Philippines* (1919); *Peoples of the Philippines* (1919); *Yuman Tribes of the Lower Colorado* (1920); *Basketry Designs of the Mission Indians* (1922); and *Anthropology* (1923). He founded the California Academy of Sciences (1917).

KROEGER, ERNEST RICHARD (1862-). An American organist and composer, born at St. Louis. After completing his entire musical education under local teachers, he served as organist in various churches in St. Louis and as conductor of several choral societies. He traveled extensively as a concert organist. His principal compositions are the overtures, *Thanatopsis*, *Pittoresque*, *Endymion*, *Sardanapalus*, *Hiawatha*, *Atala*, and *Festival*; four string quartets, a piano quintet, a piano quartet, a piano trio; many pieces for organ and for

piano, especially in the larger forms; and over 100 songs.

KROGH, AUGUST (1874-). A Danish physiologist, born in Grensa, and educated at the University of Copenhagen. He devoted himself to the study of anatomy and physiology with special reference to comparative biology and in 1916 was appointed professor of zoö-physiology at his alma mater. He has published two well-known works which have been translated into English and German: *The Respiratory Exchanges of Animals* (1916) and *Anatomy and Physiology of the Capillaries* (1922). In 1920 he received the Nobel Prize for Medicine and Physiology.

KRÜGER, FELIX (1874-). A German philosopher and psychologist. He succeeded to the chair of Wundt at the University of Leipzig on the latter's death in 1920. Best known for his *Untersuchungen über Entwicklungspsychologie* (1915), in which he studied social psychology from an historical point of view, he was also the author of several philosophical works. These include *Ist Philosophie ohne Psychologie Möglich?* (1896) and *Der Begriff des Absolut Wertvollen* (1898). From Leipzig, Kruger directed a group of researches and studies under the general title of *Entwicklungspsychologie* (Developmental Psychology).

KÜCHLER, K. F. WALTHER (1877-). A German writer, born at Essen and educated at the University of Leipzig. He was instructor in German at the University of Nancy and at Cornell, lecturer at the University of Giessen, and later professor of Romance languages at Würzburg. He is the author of *Marie Joseph Chéniers Lyrische und Dramatische Dichtungen* (1900); *Die Cent Nouvelles* (1906); *Französische Romantik* (1908); *Libussa* (1919); *Romain Rolland, Henri Barbusse, Fritz von Unruh* (1920); and *Ernest Renan* (1921).

KUHLMANN, RICHARD, BARON VON (1873-). A German diplomatist and statesman. He entered the diplomatic service in 1889 and after serving in various capacities became councillor of the German Embassy in London in 1908. He was sent as German ambassador to The Hague in April, 1915, and served at Constantinople in 1916-17. He was then appointed foreign secretary to succeed Zimmermann and held this position until his resignation in July, 1918. He was largely responsible for the treaties of Brest-Litovsk and Bucharest.

KU KLUX KLAN. An organization founded in 1915 by William Joseph Simmons, of Atlanta, Ga. While in a measure it is a revival of the society of the same name which flourished in the South during the reconstruction period, its aims and purposes are, in a larger sense, distinctly different. The organization of the modern society is claimed by Simmons to have been undertaken by him as the result of a vision. He preserved the regalia and some of the nomenclature of the original Klan, but to these he added other designations, all of which begin with the letters *kl*, e.g. Klokard, lecturer; Kladd, conductor; Kleagle, organizer; Klavern, meeting. The activities of the original Ku Klux Klan were directed almost entirely against the negroes in the South, for the purpose of preventing their participation in social and political affairs. The modern Ku Klux Klan, although it theoretically avoids stating such as its purpose, is hostile chiefly

to Jews and Roman Catholics. The fundamental doctrine of the Klan is "100 per cent Americanism." This, with its corollary principles of "no foreign allegiance" and "white supremacy," means in practice a campaign against Catholics, Jews, and negroes, particularly the first. The growth of the movement was slow, until after the end of the Great War, when Edward Young Clarke, a former newspaper man, conceived the possibility of organization on a large scale. He was made Imperial Kleagle and was appointed head of the propaganda department. Numerous agents were put in the field to organize in 40 States. They were called Kleagles. Each member enrolled paid \$10, of which the Kleagle received \$4 and the King Kleagle \$1; the remaining \$5 was sent to the Imperial Treasurer. As a result of these efforts the Klan spread with marvelous rapidity, and its effects were soon apparent. The organization soon began to function as a censor of personal conduct in many localities and imposed punishment as it saw fit. The result was an outbreak of lawlessness in many States under the name of discipline. This lawlessness reached a climax during the summer of 1922, when murders were charged to its members in Inglewood, Cal., and Mer Rouge, La. The latter was especially atrocious. It is described in the article LOUISIANA. There were also outbreaks of violence in various towns in Texas, Oklahoma, Pennsylvania, and other States. Governor Parker of Louisiana made a strong effort to bring about Federal action for the suppression of the Klan but was not successful. In many States, the legislators passed measures designed to remove the objectionable features. Most of these laws forbade the use of masks by any secret organization.

The entrance of the Klan into politics was a further step in its development. It is especially strong in the South and Middle West. In Texas, it was charged, Earle B. Mayfield was elected United States Senator in 1922 through the Klan's support. In Oregon the Klan was sufficiently powerful to put through legislation banning parochial schools. In Oklahoma its activities and the attempt of the governor to control them led to the latter's impeachment and removal. (See OKLAHOMA.) The organization is very influential in the mid-western States, Indiana, Illinois, Kansas, and Ohio. It has considerable strength in Pennsylvania. In New Jersey its membership is said to be greater than in any other State. In New York it has not gained a strong footing, but it is strong in Connecticut. It may be noted that the constitution or creed of the Klan is an instrument to which almost any good citizen might subscribe. It is only in its application that it has been harmful. The following are quotations from the Klansman's creed:

"I believe in God and in the tenets of the Christian church and that a godless nation cannot long prosper."

"I believe in the eternal separation of church and state."

"I do not believe in mob violence, but I do believe that laws should be enacted to prevent the cause of mob violence."

"I believe in the prevention of unwarranted strikes by foreign labor agitators."

"I believe in the limitation of foreign immigration."

"I am a native-born American citizen, and I

believe that my rights in this country are superior to those of foreigners."

All members of the Klan are sworn to secrecy and take binding oaths of obedience, fidelity and klannishness.

The Ku Klux Klan was an important issue in both the great national conventions in 1924. As its strength was greatest in the South, however, it was more of an issue with the Democratic than with the Republican party. In the Republican platform was inserted a plank which, in a general way, reprobated secret societies which functioned contrary to the Constitution of the United States. In the Democratic convention, the question was more serious. The Klan bitterly opposed Governor Smith of New York and Senator Underwood of Alabama, two of the principal candidates. Several speakers in the convention vehemently denounced the Klan. A resolution opposing the Klan and mentioning it by name was defeated by a majority of one vote, and the plank inserted in the platform did not differ from that of the Republicans. The Ku Klux Klan, under the name of the American party, nominated for its candidate for the presidency Judge Gilbert O. Nations. The total membership of the body is not known with any accuracy. It is estimated that there were about 2,000,000 members in 1924. Its organization was aggressively carried on, and there were indications that it would reach far greater proportions. The "idealism" proclaimed by the Klan resulted in the enlistment of many clergymen in its ranks, and in some places churches displayed signs welcoming members of the Klan to their services. In general, however, the movement was opposed by the churches.

In 1923 dissension arose in the order as a result of a controversy between W. J. Simmons, the so-called Emperor, and Dr. H. W. Evans, Imperial Wizard. Simmons charged that Evans interfered in the operation of the order. In the court action which followed, the administration of the Klan's affairs was placed in the hands of a commission consisting of the founder, W. J. Simmons; its leader at the time, H. W. Evans; and a municipal court marshal of Atlanta. The Imperial Wizard and directing head in 1924 was H. W. Evans. A woman's organization affiliated with the Klan is called the Kamelia.

KÜLPE, OSWALD (1862-1916). A German philosopher (see VOL. XIII). He died in 1915 before completing a treatise on psychological theory embodying the contentions of the imageless thought school. His unfinished work was published posthumously by his pupil Karl Bühler under the title, *Vorlesungen über Psychologie* (1922).

KUMMER, FREDERIC ARNOLD (1873-). An American author and playwright, born in Catonsville, Md. His best-known works include: *Plaster Saints* (1921); *When the Earth was Young* (1922-23); *My Golden Girl*, with music by Victor Herbert (1919); *The Bonehead* (1920); *The Voice*, in which William Courtenay starred (1923). He often wrote under the pseudonym of Arnold Fredericks. Besides his work for the legitimate stage he wrote many motion picture scenarios, including *The Slave Market*, *The Yellow Pawn*, *Motherhood*, *The Ivory Snuff Box*, and *The Belgian*.

KUN, BELA (1886-). A Hungarian Communist leader. He had long been identified

with Communist activities and his abilities had won him a high place in the movement. He organized a revolution at Budapest, in February, 1919, which brought about the resignation of the Karolyi cabinet. He was appointed commissary for foreign affairs in the Hungarian Soviet government in March and negotiated with General Smuts, acting for the Allied Peace Conference, in April of that year. As recognition was refused, he made a military alliance with the Russian Soviet government. The Communist government was overthrown in August, 1919, and he fled to Vienna. He was captured and interned in Austria but was released in exchange for Austrian prisoners in Russia in July, 1920. See HUNGARY, *History*.

KUNZ, GEORGE FREDERICK (1856-). An American mineralogist (see VOL. XIII). Among his later writings are *E. Roty and His Work* (1914), *Magic of Jewels* (1915), *Ivory and the Elephant* (1915), *Shakespeare and Precious Stones* (1916) and *The Ring* (1917).

KUPRIN, ALEXANDER I. (1870-). A Russian writer, belonging to the realistic school. He is an excellent story-teller. His most famous novel is *The Duel* (1905), a story of barracks life. He also wrote some delightful stories for children, as well as many sketches, and made for himself a reputation abroad. His writings include *Short Stories* (1893-1918); *The Duel* (1905); *Sulamith* (1908); *The Pit* (1909-1913); *A Bracelet of Garnets* (1911); *Leaystrygonians* (1912); *The Black Sea Coast*; *Moloch*; and *At Rest*.

KURDISTAN. A region in eastern Asia Minor comprising for the most part the Turkish vilayets of Mamuret-ul-Aziz, Diarbekr, Bitlis, Van, but also the northern section of the vilayet of Mosul in the now independent state of Iraq or Mesopotamia, and part of western Persia. It is inhabited by the Kurds, a seminomadic people related to the Persians in race and language, but belonging to the Sunni sect. The total population was estimated at 2,500,000. It had been the consistent policy of the old Turkish government to settle the Kurds among the Armenian populations, and thus, by singling them out for special favors, to create strong Mohammedan centres in these unruly vilayets. The independent spirit thus fostered naturally rendered the Kurds indifferent to the War, with the result that their participation was negligible. The Russian policy, once the Russians were in control of Erzerum and Bitlis after 1916, was designed along the same lines, and the Kurds were played off against the Armenians. The entry of the British into Mesopotamia, and the promises held out by British political officers of a Kurdish independent state, naturally made Kurdish leaders gravitate toward Great Britain. With the exception of temporary setbacks early in 1919 when the Sheik Mahmud rose against the British in southern Kurdistan, British penetration into the country was uniformly successful through 1919. The extravagant scheme of sending loosely coordinated units into a far-flung area brought reverses, for in 1920, as a result of native uprisings, the British were compelled to withdraw from the greater part of the region. By the Treaty of Sèvres (1920) provisions were made for the satisfaction of Kurdish national aspirations. An inter-Allied commission was to erect an autonomous government within the area east of the Euphrates, south of the future

boundary of Armenia, and north of Syria and Mesopotamia; a commission of Allied representatives acting with Kurds and Persians was to rectify the frontier between Kurdistan and Persia. If within one year from the coming into force of the treaty, the Kurds gave evidence to the League Council of their desire for complete independence, and if the Council approved, Kurdistan was then to be raised to the dignity of a separate sovereign state, and, in that event, Great Britain must permit the voluntary adhesion of the Kurds in Mosul, part of the Mesopotamia mandate, to the new state. The failure of the Sevres treaty and the realignments effected in subsequent years caused the hopes of the Kurds for independence to be forgotten; the final treaty of Lausanne in 1923 made no mention of a free Kurdistan; and the Kurds remained subject to alien rule. Like prewar Poland, Kurdistan was divided among three alien nations, namely, Turkey, Persia, and Mesopotamia.

KURZ, ISOLDE CLARA M. (1853-). A German writer, born at Stuttgart, the daughter of Hermann Kurz, novelist, translator, and librarian at the university of Tübingen. She lived for many years in Florence. She is the author of *Gedichte* (1890); *Italianische Erzählungen* (1895); *Von Dazumal* (1900); *Die Stadt des Lebens* (1902); *Neue Gedichte* (1905); *Hermann Kurz*, a biography (1906); *Lebensflut* (1907); *Florentinische Erinnerungen* (1909); *Im Zeichen des Steinbocks*, a volume of aphorisms (1909); *Die Kinder der Lilith* (1909); *Cora und Andere Novellen* (1914); *Schwert aus der Scheide*, a volume of verse (1917); *Aus Meinem Jugendland*, an autobiographical work (1919); *Traumland* (1920);

and *Legenden* (1920). She also translated much from the French, English, Italian, and Russian, and received the degree of doctor *honoris causâ* from the University of Tübingen.

KUT-EL-AMARA. See WAR IN EUROPE, *Turkish Front*.

KUTSCHER, ARTHUR (1878-). A German critic, born in Hannover, and educated at the University of Munich. He is the author of *Naturgefühl in Goethes Lyrik* (1906); *Hebbel als Kritiker des Dramas* (1907); *Die Kunst und Unser Leben: Grundstein zu einer Kritik* (1909); *Schiller und Wir* (1909); *Die Ausdrucksmittel der Bühne* (1910); *Hebbel und Grabbe* (1913); *Kriegstagebuch* (1915); *Frank Wedekind, Sein Leben und Sein Werk* (1921); and other works. He compiled an anthology of soldier songs, *Das Richtige Soldatenlied* (1917), edited the complete works of Frank Wedekind (1921), and made many stage adaptations.

KWANGCHOW WAN. See FRENCH INDO-CHINA.

KYNE, PETER BERNARD (1880-). An American novelist, born in San Francisco, Cal., and educated in the public schools and in a business college of that city. For several years he was engaged in the lumber business. He served in the Philippines during the Spanish-American War and was captain of the 144th Field Artillery during the War in Europe. His books, which are widely popular, include *Three Grandfathers* (1913); *The Long Chance* (1914); *Cap-py Ricks* (1916); *The Valley of the Giants* (1918); *Kindred of the Dust* (1919); *The Green Pea Pirates* (1920); and *Pride of Palomar* (1921). He was a frequent contributor of short stories to magazines.

L

LABOR, AMERICAN FEDERATION OF. A nonsecret confederation of self-governing trade unions in the United States, Canada, Porto Rico, and Panama, comprising five industrial departments: the building trades, metal trade, union label trade, railway employees, and mining. Its paid-up membership increased nearly 300 per cent between 1910 and 1920, from 1,562,112 to 4,078,740, but after 1920 it began to fall and reached 2,926,468 in 1923. The number of local unions in 1914 was 21,460; in 1921, 36,247. Available funds in 1914 amounted to \$366,230 and expenditures to \$265,737; in 1921-22 receipts were \$761,382 and expenses \$562,588. Samuel Gompers continued to hold the presidency, being elected to that position at the 44th annual conference, in 1924, for the 43rd time. During the War the organization made every effort to work with the Government of the United States; every single act of the president and executive council in connection with the War was unanimously approved without discussion. Its loyalty was strengthened by government recognition of trade-union standards and by such appointments as that of Samuel Gompers as an important member of the Committee of Council of National Defense and that of the first vice president as member of the Commission to the Russian People. This recognition on the part of the government, and to some extent a rise in the cost of living, strengthened the leadership of the Federation during the war period. On the other hand its influence was somewhat weakened in that the Labor Board frequently dealt direct with disaffected groups, instead of through the central organization of the Federation. Later, industrial instability, together with the prevalence of high wages, drew many workers away from the unions. In 1923 efforts were redoubled for the organization of nonunion labor, with much propaganda directed against the open shop.

Throughout the decade 1914-24, the American Federation of Labor held firmly to its policy of nonpartisan political activity. Despite a serious movement beginning in 1918 to form a national labor party, and the election of two United States Senators in one State by the newly organized Farmer-Labor party, the Federation maintained its political activity on the nonpartisan basis of "reward your friends; punish your enemies." In 1924 the Federation leaders wholeheartedly endorsed the candidacy of La Follette. The organization did not abate its hostility toward socialism, syndicalism, the I.

W. W., and other radical labor movements. Although in 1920 the more radical element within the Federation triumphed over the conservative in favor of government ownership and operation of railways, carried on distinct opposition to the conservative administration through 1921, and demonstrated in 1922 over the question of recognition of the Russian Soviet government, the policy of the Federation in 1923 was wholly directed by the conservatives. The radical W. F. Davis had been expelled, the Federation taking the position that "those who seek to destroy the legitimate labor movement must do it from without." In its attitude toward social development through intervention by the State, the Federation likewise maintained its traditional policy. This may be briefly outlined, in the Federation's own words, as favoring laws to protect the helpless, to abolish special privilege and to free industry for the working out of its purely industrial problems, to make government more responsive to the needs of the people and to deprive courts of the power to rule as well as to adjudicate.

Thus the Federation worked for protective laws for women and children, for seamen and for government employees. It supported safety and health measures and adequate workmen's accident insurance legislation. It urged the advance planning of public works as an aid to combating unemployment and the development of a permanent, effective public employment service, though it was hesitant about joining in the movement for unemployment insurance, which made substantial gains in the latter few years. It applauded the decision in 1920 against the Kansas Court of Industrial Arbitration and in many ways opposed the principle of compulsory arbitration strenuously. A constructive feature of the Federation's policy was its aid to coöperative schemes and its promotion of friendliness with farmers' organizations. A legal achievement was the clause that Congress put in the Clayton Antitrust Law in 1914, a recognition of the principle that the labor of a human being is not a commodity or article of commerce, and thus a guarantee of certain rights in connection with labor organization and the use of the boycott. Among the measures of broad social import advocated by the Federation were the restriction of immigration; gradual reduction of army and navy; regulation of large industries; extension of popular control of government; limitation of the power of the Supreme Court; and an amendment to the Volstead Act permitting the manufacture and sale of beer. It pro-

tested against the ship subsidy bill and military education in the schools. It expressed an unfavorable opinion of the Ku Klux Klan as an unconstitutional organization and a detriment to labor and declared against the alleged discrimination against Jews at Harvard, although after an investigation the Federation held that such discrimination was nonexistent. In connection with negro labor, an effort was made to prevent the drawing of a color line, and a special organizer was sent to work among the negroes in the South. The Federation officially declared its sympathy with India and Ireland; it favored the entrance of the United States into the League of Nations and the World Court.

Although the Federation sent no representative to the Inter-Allied Labor Conference at London in 1918 or to the conference in Berne after the Armistice, although its proposition for an inter-Allied labor conference at Paris was not accepted, and although it could not be officially represented at the meeting of the Labor Department of the League of Nations at Washington in 1919, its international relations widened appreciably during these years. In 1916 steps were taken to cultivate friendly relations with organized labor in Mexico, South America and Japan. A Pan-American Federation of Labor Conference Committee was created in that year. In 1918 small groups were sent to Europe to confer unofficially with organized labor in Allied countries, and in 1919 the Federation was represented at the International Trade Union Conference in Amsterdam. While the peace terms were under discussion, the Federation formulated its official attitude on the matter; this was based largely on the declaration of President Wilson, which included in its suggestions that the treaty bar from shipment in international commerce all products involving the labor of children under 16 and that it declare for the basic standard of an 8-hour day. In 1923, affiliation with the International Federation of Trade Unions was strongly recommended.

LABOR ARBITRATION. The decade after 1914 witnessed an increased recognition of the imperative necessity of applying methods of arbitration and conciliation to industrial disputes. Concentrated efforts were made during that period to prevent by the wider use of arbitration the harmful effects of strikes, lockouts and other violent means of settling industrial controversies, and, although many attempts were unsuccessful, there were marked advances toward industrial peace. Public opinion at least had been awakened to the undeniable desirability of the substitution of peaceful action for violence. The more complex nature of industrial problems in the later years, the importance of unobstructed production during the War, the stronger organization and the increased sense of power of the trade unions, the unsettled industrial conditions after the War and the resulting unrest, the growing demands on the part of the workers, the steadily increasing specialization and interconnection of industries, all combined to bring about a realization of the imperativeness of labor arbitration. This realization found expression not only in governmental action, but also in numerous attempts on the part of employers and employees to find a *modus vivendi* in industry. Thus the decade was characterized by a constantly increasing number of trade union agreements making pro-

vision for various methods of conciliation.

The United States. During 1914 a number of serious strikes and labor disputes were successfully settled by arbitration. The most important event of that year in arbitration legislation was the enactment by Alaska of an elaborate law relating to the adjustment of trade disputes. In 1915, a year of many strikes, the Department of Labor offered its services as mediator in 32 labor controversies, of which 24 were amicably settled, the most important being the Western Railroad case. In the same year, Colorado passed a law setting up an industrial commission with wide powers to arbitrate. John D. Rockefeller, Jr., advanced his Industrial Representation Plan, a comprehensive scheme for the handling of all relations between employers and employees. Of far-reaching importance was the effective trade agreement made in the New York clothing industry, whereby a two years' peace was established. The year 1916 brought an increase in sentiment for the amicable settlement of labor disputes, which was manifested in the various attempts to terminate by arbitration the troublesome strikes and conflicts of that year, and in the arbitration machinery agreed upon between the Boston Elevated Railroad Company and its employees, and in another case between the Hart, Schaffner and Marx Company in Chicago and the Amalgamated Clothing Workers. But the most notable event of the year was the passage by Congress of the Adamson Eight Hour Law. After unsuccessful attempts at arbitrating the disputes which threatened to bring about a strike of the four railroad brotherhoods, a law was passed providing that after Jan. 1, 1917, "eight hours shall, in contracts for labor and service, be deemed as a day's work," and empowering the President to appoint a commission of three to investigate for a period of six years the workings of the law. Opponents of the Adamson Law criticized it as being a result of intimidation by the brotherhoods and as imperiling the principle of arbitration. On Dec. 5, 1916, President Wilson made a plea for full public investigation of industrial disputes as an effective means for the prevention of strikes. With the entrance of the United States into the War, prevention of labor disputes became especially urgent and a labor policy toward that end was entered upon by the government. As a consequence, the Committee on Labor of the Advisory Commission of the Council of National Defense began in June, 1917, the establishment of local committees of mediation and conciliation, composed of representatives of the employers, the workers, and the general public. In August of the same year an important agreement was reached between the government and the international unions engaged in American shipyards. Under this compact a National Board of Adjustment was created as the final arbiter as to wages, hours, and conditions of work, and the unions agreed not to strike as long as the agreement was in force. The final step of the government in the prevention of strikes was the creation of a National War Labor Board in April, 1918. The functions of this board were to be: to bring about the settlement of labor disputes by mediation and conciliation in all industries essential to the effective conduct of the War, to establish the necessary machinery for this purpose, and in case of failure of local mediation to carry on

the arbitration themselves. The board was to be composed of five representatives of the employers' organizations, five of the A. F. of L., and two impartial chairmen, one for the employers and the other for the workers. The board served successfully as a means of settling disturbing labor troubles during the War. The year 1918 saw also the Altschuler award in the Chicago packing industry, which provided machinery for the settlement of grievances and under which the workers bound themselves not to strike pending the attempts at peaceful settlement of their disputes. The very serious industrial troubles which broke out after the Armistice led to the calling by President Wilson of the First Industrial Conference on Oct. 6, 1919, for the purpose of considering the fundamental means of bettering the whole relationship between capital and labor. After its failure the Second Industrial Conference was called, which presented on Dec. 23, 1919, a plan proposing the establishment of a National Industrial Tribunal and of Regional Boards of Inquiry and Adjustment. On Mar. 1, 1919, the conference issued its final report, in which it recommended as the best means for the prevention of industrial conflicts such agencies as had already been established in various trades; namely, shop committees and councils, work councils, etc., and, in case these failed, adjustment by the above-mentioned boards. The programme of the conference did not, however, find practical application, although mediation through the government had proved rather successful during the War. Arbitration was resorted to with satisfactory results in a number of important disputes during 1921. A case in the packing industry was adjusted by a conference in Washington of the representatives of the employers and employees and the Secretary of Labor. The executive council of the International Typographical Union decided to maintain arbitration in the printing industry in New York and to submit its wage disputes to arbitration. On Jan. 1, 1921, the Pennsylvania Railroad system set up a joint reviewing committee "for the amicable settlement, by joint conference, of all controversial questions affecting the engine and train service men." A Court of Industrial Relations on the principle of compulsory arbitration was created in Kansas, in 1920. The court affected a number of industries and was composed of three judges appointed by the governor. It was given wide powers, such as to make reasonable awards, investigate industrial conditions, bring suit in the Supreme Court of the State to enforce obedience to its orders, and to take over and run industries in case of emergency and limitation or actual suspension of production. Organized labor was strongly opposed to the court and serious difficulties arose from the conflict between the court and the trade unions in the State. In 1923, the United States Supreme Court unanimously held wage fixing by the Kansas court to be unconstitutional. (See KANSAS.) Machinery for the adjustment of labor disputes on the railroads was set up under the Transportation Act which was passed by Congress in February, 1920. The act provided for the settlement of controversies and grievances between the railroad workers and the managements by the establishment of the United States Railroad Labor Board, which is composed of nine members, appointed by the President. The Board attempted unsuccessfully

to arbitrate in the great strike of the railway shopmen in 1922. Perhaps the most comprehensive means for the peaceful settlement of industrial disputes existed in the agreements between the Amalgamated Clothing Workers and the clothing manufacturers. Especially notable here is the Trade Board established in Chicago, consisting of two representatives of the union, two of the employers, and an impartial chairman. Practically all the decisions rest virtually with the chairman.

Great Britain. Due to the powerful organization of British labor, methods of arbitration have progressed further in Great Britain than in the United States. A great advance was made in the former country by the establishment of the Industrial Council, which was composed of 13 representatives of the employers, an equal number of representatives of the workmen, and Sir George Askwith as impartial chairman. The latter arbitrated in 1914 the strike of the unskilled workers near Birmingham. At the Treasury Conference of 1915, the trade union officials and the government concluded an agreement for the purpose of regulating the relations between employers and workers for the duration of the War. The compact stipulated that all disputes should be settled by conferences between the parties or, in case they failed to agree, by three other possible means of arbitration. The miners were the only ones who remained outside of this pact. The Treasury Agreement, however, did not prevent serious unofficial strikes during the remainder of the War. The establishment of the Joint Industrial Councils during the latter part of the War and immediately after the Armistice served effectively to preserve industrial peace in a great number of trades. Probably the most important measure, however, regarding the relations between capital and labor was the Industrial Courts Act of 1918. It created a standing Industrial Court, composed of independent persons and representatives of the employer and employees, all of them appointed by the government. The court is a permanent industrial tribunal and as such has settled a great number of disputes by making awards, the most important of which was the Dockers' Court of Inquiry early in 1920. Although the court has no power to compel compliance with its decisions, the number of awards repudiated by the losing side has been negligible. The most momentous single arbitration case in Great Britain was the Coal Commission of March, 1919, which was set up on the demand of the miners for the six-hour day, higher wages, etc. It consisted of six representatives of the miners, six of the mine owners, and an impartial chairman, and dealt with wages, hours, and nationalization of mines. The interim report on wages and hours was published in three parts. The part that called for the seven-hour day, and which was signed by the chairman and three representatives of the employers, was adopted by the government. None of the reports on nationalization were put into effect. It may be said that with the trade boards, the Industrial Court, and the joint industrial councils, Great Britain had three effective agencies for the prevention of industrial disputes by arbitration. See STRIKES AND LOCKOUTS.

LABOR BANKS, UNITED STATES. That extension of the principle of coöperation (q.v.) which led to the establishment by labor of co-

operative banks did not take definite hold in the United States until 1920. The first bank in *Labor Review* of the United States Department of Labor, July, 1924:

FINANCIAL STATISTICS OF LABOR BANKS
IN THE UNITED STATES

Controlling body and name of bank	Date of state-ment	Capital	Surplus	Undi-vided profits	Deposits	Assets
<i>In operation</i>						
Amalgamated Clothing Workers:						
Amalgamated Trust & Savings Bank, Chicago	1924 Mar. 31	\$200,000	\$100,000	\$17,705	\$1,895,688	\$2,257,302

^a Includes undivided profits

^b Included with surplus

^c Has branches at Barstow and Needles, Cal. According to the *Labor News* (Eureka, Cal.) Jan. 19, 1924, this bank plans to build up a chain of banks throughout the State.

^d No data available.

^e Bank has received its charter.

^f The *Leather Workers' Journal*, May, 1924, p. 106, states that this bank is officered by union labor.

^g The April number of the *Brotherhood of Locomotive Firemen and Enginemen's Magazine* states (p. 180) that this bank was to open its doors about April 5, 1924. Charter granted.

this country to be owned and controlled by a labor organization was the Mt Vernon Savings Bank, Washington, D. C. (1920). In that year also, the Brotherhood of Locomotive Engineers founded at Cleveland, Ohio, what was then said to be the only national bank in which depositors shared earnings. The success of this considerable venture (in 1924 it still had the largest total resources of any single labor bank in the United States) stimulated the establishment of similar institutions. The rapid expansion of the movement in the succeeding years is shown by the accompanying table, from the *Monthly*

The labor bank is distinguished from the ordinary commercial bank chiefly in that (1) it is owned and controlled by labor; (2) it limits the dividend payable to stockholders to 10 per cent; (3) it pays a higher rate of interest on deposits (generally 4 per cent on savings, and 2 per cent on checking accounts above \$500), and computes interest from the first day; and (4) it pays to the depositor, over and above interest, dividends from its net earnings. The labor bank is chartered in the regular way, under State or Federal laws, and is subject to the usual strict examination. Control rests

with the labor union (or unions) and its membership: (a) through possession of the majority of the voting stock of the bank; and (b) through union officials and other men in sympathy with labor, who constitute the majority of the officers and board of directors. The labor union itself as an organization operates the bank, assuming the usual financial liability to depositors. Business and administrative affairs are in the hands of experienced bankers, acting with the trade union officials. The fact that labor leaders in the banks were not only legally responsible as bank officials but were also responsible to the labor organizations, made for unusual care in choosing competent bankers to administer affairs, and so for conservative policies. The temptation to take risks was further lessened by the limitation on the number of shares to be owned by an individual, usually to three. Without any known exception, labor banks up to 1924 were having considerable financial success. Notwithstanding the limitation on dividends, the market value of labor-bank stocks was above par.

In addition to offering unusual advantages to the depositors and stockholders, the labor bank was a source of strength to the trade union. For one thing, it earned for the union, on its defense and insurance funds, a profit in excess of the interest that these funds ordinarily drew from commercial banks; and not only was it able to supply funds for the sound enterprises of other unions or coöperatives which might otherwise be left unaided, it was in a position to discriminate in granting its loans between employers who were favorable and those who were unfriendly to labor. Moreover, the existence of the labor bank weakened the pressure that commercial banks might exert on individual employers during strikes, by withholding credit. A number of the labor banks were depositories of State and city governments and members of the Federal Reserve system. By the close of 1923, the sum total of labor-bank resources in the United States (exclusive of the Brotherhood Investment Company) was estimated by the *American Labor Year Book* at approximately \$50,000,000. The Brotherhood Investment Company, with a capitalization stock of \$10,000,000, was chartered in 1922 for the purpose of buying and holding stocks of banks and trust companies, and dealing in high-grade investment securities. This institution, because of the scope of its activities, could participate in large-scale financial operations. Although about 20 per cent of its stock was in the hands of other than workingmen, the Brotherhood of Locomotive Engineers as an organization was in possession of 51 per cent of the voting stock.

LABOR LEGISLATION. Although America's first labor law was enacted 88 years ago, when Massachusetts set up an educational requirement for working children, and although the development has continued steadily since that time, by far the greater part of effective labor legislation is the fruit of the past decade (1914-24).

A significant forward step is the constitutional amendment recently passed by Congress which, if it is accepted by three-fourths of the States, will make it possible for that body to enact laws regulating child labor throughout the country. This came after two attempts of the Federal legislature to restrict the labor of

children, both of which were declared unconstitutional by the Supreme Court (see *CHILD LABOR*).

There are now eight more laws than there were in 1914 (making a total of 15), which either fix a minimum standard of wages for children and women or provide for the setting of such a standard. These laws have been passing through a period of economic trial and judicial test somewhat like that which marked the path of the early hour legislation. In fact, the constitutionality of even the Massachusetts law—which makes no compulsion but calls only for the publication of the names of those employers who do not comply with it—has recently been attacked by a Massachusetts court (see *MINIMUM WAGE*). There has also been progress in the regulation of the form and method of wage payments and establishment of wage preferences and mechanics' liens.

During the decade, 25 additional States, Porto Rico and the District of Columbia, have limited the number of hours that women may work or have prohibited night work, while many of the older laws have been made more stringent and more definitely enforceable. There are now only four States in the country—Alabama, Florida, Iowa, and West Virginia—that have no law whatever to regulate the hours of work for women (see *HOURS OF LABOR AND WOMEN IN INDUSTRY*). Legal regulation of men's working hours has by no means been confined to public works and public utilities—although during the past decade many laws have been passed regarding hours in public employments. Legislation limiting the hours of men in dangerous private employments has made a considerable advance. Oregon has recently moved on to the eight-hour day in the lumbering industry, but with a reciprocal provision that the new law goes into effect only after adjoining States have adopted the same restriction (see *HOURS OF LABOR*).

The first accident-reporting law dates from 1886, but most of the scientific gathering of accident statistics is the work of the past decade. The first law requiring safety devices in factories was adopted in 1887, but it is only within about 10 years that universal progress has come in accident prevention. Mining codes have also been enacted or improved, while during the year 1924, the Industrial Commission of Utah, after a mine explosion at Castle Gate which took 172 lives, adopted a set of mine safety regulations unique in its comprehensiveness and in its application of the best thought on the subject. Much public interest in industrial hygiene was manifested in the year immediately following 1910, but since 1914 most of the States have adopted new regulations of factory sanitation and ventilation or improved their former laws.

The past decade saw the successful operation of a Federal Employment Service for about a year and a half during the War, and a subsequent decline in its effectiveness through enormously reduced appropriations. It has witnessed as well the establishment of many State public employment services and a considerable development in the regulation of private fee-charging bureaus. Three States, by specific law, have officially recognized the importance of long-range planning of public works to provide employment in periods of business depression (see *UNEMPLOYMENT*).

Another important development during the last 10 years is the advance in legislation providing accident compensation for those injured in the course of employment. Since 1914, 22 State compensation laws have been enacted, and most of the older laws of the country have been liberalized in one way or another since they were originally passed (see *WORKMEN'S COMPENSATION*). In addition, 36 States have, within four years, voted to cooperate with the Federal government in the vocational retraining of industrial cripples.

As an outgrowth of the same social spirit within the past year, pioneer legislation in three States has established old age pensions. (See *OLD AGE PENSIONS*.) Mothers' pension systems are now in operation in 43 States and Territories while 40 States have accepted the Federal appropriation for maternity protection offered by the Sheppard-Towner Act of 1921. See *MOTHERS' PENSIONS* and *MATERNITY PROTECTION*.

The legislation affecting collective bargaining has not been of great importance. The power of the Kansas Court of Industrial Relations compulsorily to arbitrate conflicts between employers and employees was practically annulled by a recent United States Supreme Court decision. (See *LABOR ARBITRATION*.) A number of States during the War and shortly after enacted laws defining and penalizing criminal syndicalism and sabotage; but several States also officially recognized trade unions and declared human labor is "not a commodity." See *TRUSTS*.

One of the outstanding developments of the decade has been in the field of labor law enforcement and administration. All States now have some provision for the special administration of labor legislation, while most of them have some central body for the purpose. In five States, industrial commissions modeled after that of Wisconsin not only enforce the labor law but issue orders which have the compulsion of law, after the Legislature has laid down the general principles which the regulations are to follow. An industrial commission, which also makes constant investigations, is in a far better position to determine the detailed application of a statute than is a body of miscellaneous legislators meeting but once in two years.

The principal hindrances to labor legislation in the past have been (1) the opposition of business interests; (2) the after-war reaction, and (3) adverse court decisions. Fourteen times during the past 10 years, the United States Supreme Court has decided cases affecting labor by four-to-five or by four-to-four decisions.

Helpful influences in labor legislation include (1) the more general spread of knowledge of the need and practicability of legal protection; (2) the development of effective scientific propaganda organizations such as the Consumers' League, the Child Labor Committee and the American Association for Labor Legislation; (3) the more active participation of women in public activities; and (4) the application of Federal-State financial cooperation which had within three years led to the adoption of vocational rehabilitation of industrial cripples by three-fourths of the States and the rapid extension of maternity protection in an even greater number of jurisdictions.

A brief survey is sufficient to show how modern indeed is most of our labor legislation.

Probably all of it is in need of improvement today, but considering the rapidity with which fundamental changes in legislation have spread over the country during the past 10 years the prospect seems favorable for future advances wherever the need is clear and the opportunities for public enlightenment are available. See *IMMIGRATION*.

Supreme Court Decisions. Decisions by the United States Supreme Court have shown an increasing tendency to overrule legislation for the protection of labor and to curtail labor's organized activities. In the later years many important decisions were handed down by a closely divided court. A survey made by the United States Bureau of Labor Statistics of the decisions by the Supreme Court, in which cases affecting labor were involved, disclosed the fact that within 40 years there had been 21 cases decided by a vote of four to five or four to four; 13 of these, or nearly two-thirds of the total, falling within the last 10 years. It appeared that members of the Court were with increasing frequency unable to agree as to whether or not an act of legislation is "plainly and palpably, beyond all question, in violation of the fundamental law of the Constitution."

Many of the Court's decisions in the early years of the decade 1914-24 were favorable to labor, particularly in the field of protective legislation, but in the later few years measures of far-reaching importance to the welfare of wage-earning men and women were nullified by the opinions of a bare majority of the court.

Perhaps the most important favorable decisions of the Supreme Court during this period were those in favor of the constitutionality of workmen's compensation laws. In giving its final assent to this form of protective legislation the Court took the advanced ground of upholding laws providing for compulsory and exclusive State funds for workmen's accident insurance. In its decision sustaining the 10-hour day for factory employees in Oregon the court for the first time recognized the power of a State to enact laws limiting the hours of work of men in private employments as well as of women and children. In the Adamson eight-hour law decision of 1917 the court held that Congress had the power to limit the number of hours to eight for trainmen engaged in interstate commerce. A New York law prohibiting night work of women in restaurants was upheld as was also a law of Oregon establishing a minimum wage for women and minors (see *MINIMUM WAGE*).

On the other hand, the Supreme Court in a third dividend decision finally blocked the efforts of Congress to provide accident compensation for longshoremen and other local harbor workers under State laws. In two decisions it nullified attempts by Congress to abolish child labor (see *CHILD LABOR*) and in another later decision which aroused widespread interest it declared unconstitutional a Federal law providing a minimum wage for women and children in the District of Columbia.

Among the important decisions of the Supreme Court which tended to weaken organized labor in the field of collective bargaining were those in the so-called Danbury hatters' and Arkansas coal miners' cases which established the principle that labor unions and their individual members are responsible, without limit, for

the unlawful actions of the union officers and agents which they have in any manner authorized or sanctioned; the Copeage vs. Kansas decision which declared unconstitutional a State statute aimed to prevent an employer from forcing his employee to agree not to join a trade union during his term of service; the Hitchman Coal and Coke Company vs. Mitchell decision which held that where an employer has compelled all of his employees to sign a contract that they will not join any labor union, it is illegal to make any effort to organize them; the Duplex Printing Company decision in which the court clearly distinguished for the first time between "primary" and "secondary" boycotts, and declared that the Clayton amendment to the Sherman Antitrust law had not legalized the secondary form; the United Mine Workers of America vs. Coronado Coal Company decision in 1922 which held that trade unions are suable in their own names—the first case of importance in America permitting a suit against an unincorporated union.

The fact that an increasing number of far-reaching decisions of the Supreme Court in cases affecting labor had checked protective legislation and trade union activities—and had been handed down by a closely divided court—made a political issue of the contention that the Court is the chief obstacle to social progress in America and that action should be taken by Congress to limit the power of the Court to pass upon the constitutionality of laws. See LAW, PROGRESS OF THE.

LABOR OFFICE, INTERNATIONAL. See LABOR ORGANIZATION, INTERNATIONAL.

LABOR ORGANIZATION, INTERNATIONAL. One of the most significant and novel features of the Paris peace settlement of 1919 was the incorporation as Part XIII of the Treaty of Versailles of a special Labor Convention setting forth a charter of principles for labor legislation and providing for the establishment of a permanent International Labor Organization. This labor section of the treaty represented a signal triumph for the cause both of internationalism and of labor. A commission on international labor legislation, with 15 members including such prominent leaders as Samuel Gompers, the Anglo-Jewish president of the American Federation of Labor, and Vandervelde, the patriotic Belgian Socialist, was appointed by the Peace Conference in January, 1919, to formulate suitable treaty provisions for labor welfare and unemployment. The Commission made its report on March 24. Following detailed consideration and revision by the Council of Four, this report was adopted on April 11. It consisted of two parts, one creating a permanent organization for international labor legislation and the second enunciating a veritable bill of rights for labor. Recognizing that the existence in the various countries of special circumstances arising from differences of climate, habits, and customs of economic opportunity and industrial tradition made strict uniformity in the conditions of labor difficult of immediate attainment, the essential methods and principles were affirmed to be: (1) consideration of labor not as a commodity; (2) right of association for lawful purposes for both employers and employees; (3) payment of a wage adequate to maintain a reasonable standard of life; (4) adoption of an 8-hour day or 48-hour week; (5) adoption of a weekly

rest of at least 24 hours, including Sunday whenever practicable; (6) abolition of child labor and continuation of the education and proper physical development of children; (7) equal remuneration for men and women for work of equal value; (8) equitable treatment in every country of all workers lawfully resident therein; and (9) adequate systems of inspection in which women should participate, to insure enforcement of protective regulations. These aims and purposes were sanctioned in the League of Nations Covenant (Article XXIII, Section A).

The machinery of the International Labor Organization as created by the Convention embraced two major organs, a periodic International Labor Conference and a permanent International Labor Office. The Conference, composed of four delegates from each member-state, two appointed by the government and one each by the most representative organizations of employees and workmen respectively, was to meet at least once a year, to consider labor problems, to discuss standards of labor welfare, to debate feasible measures for the attainment and maintenance of these standards, and to formulate decisions either as conventions for ratification or rejection by the national parliaments of the world, or as recommendations to be submitted to and considered by these national parliaments or local legislatures. These conventions might then be executed by means of appropriate domestic legislation. Up to July, 1924, the Labor Conference had met six times. The first meeting was held at Washington, D. C., Oct. 29–Nov. 29, 1919. Though the United States was not officially represented, 121 delegates from 39 other countries were in attendance. Germany and Austria were admitted to membership by a vote of 71 to 1. Six draft conventions and six recommendations were adopted; the most noteworthy achievement was an 8-hour day convention. The other conventions dealt with unemployment, care of female workers in industry before and after childbirth, prohibition of nocturnal employment of women in industry, prescription of a minimum age of admission of children to employment, and the prohibition of night employment for children under 18. The second session was held at Genoa, Italy, in June, 1920, when 27 nations were represented by specialists competent to deal with conditions of maritime labor. Three conventions were adopted, dealing with seamen's employment agencies, payment of unemployment insurance in cases of shipwreck, and prescription of a minimum age of 14 years for employment of boys at sea; recommendations were also made on unemployment insurance, enactment of national seamen's codes, and regulation of hours of work in the piscatorial industry and inland navigation. A Permanent Joint Maritime Commission was constituted to further the work of improving maritime labor conditions. The third session of the Labor Conference held at Geneva, Switzerland, during October, 1921, dealt mainly with problems of agricultural labor. Strenuous French objections to any consideration of these problems as alien to the jurisdiction of the Labor Organization were overruled and subsequently the Permanent Court of International Justice at its first session in July, 1922, definitely established the competence of the Conference. A whole series of conventions and recommendations were adopted dealing with

labor in general and specifically extending to agriculture. Legislation had hitherto been restricted rather narrowly to urban industrial labor. These 1922 measures included limitation of hours of labor, unemployment insurance, improvement of working conditions, and protection of women and children. The fourth annual meeting, at Geneva in October, 1922, adopted a recommendation calling for more adequate and accessible information regarding transit and migration of persons from one country to another. Also adopted for submission to the League of Nations was an amendment to Article 393 of the Treaty of Versailles; it elaborated and liberalized somewhat the governing body thereby set up to control the International Labor Office. The fifth session, held in October, 1923, was principally concerned with the general principles of the organization of factory inspection. At the sixth session, in June, 1924, great satisfaction was expressed at the steadily improving industrial conditions of Europe.

The International Labor Office was subjected to the control of a governing body of 24 members appointed annually by the International Labor Conference: the 1922 amendment had proposed a body of 32 triennially selected members at least 12 of whom should be non-European. This body had the functions, first, of preparing the agenda of the Conference; secondly, of conducting the correspondence and negotiations involved in the execution of its decisions; and thirdly, of making technical investigations and collecting and disseminating general information about labor conditions in all parts of the world. Organized first at London in January, 1920, the Labor Office was in July, 1920, transferred to the seat of the League of Nations at Geneva; for the Labor Organization, although autonomous, was placed under theegis of the League and was to be supported financially by grants of money made by the League Assembly. The first director of the Labor Office was Albert Thomas, the French Socialist and labor leader, who had been an exceedingly capable Minister of Munitions during the War. Under his able supervision an administrative staff of some 350 experts, men and women from 28 countries, was recruited and trained.

LABOR ORGANIZATIONS. See **TRADE UNIONISM**.

LABOR PARTY, AUSTRALIAN. See **AUSTRALIA**.

LABOR PARTY, BRITISH. See **GREAT BRITAIN; SOCIALISM, Great Britain**.

LABRADOR. A dependency of Newfoundland, and the most easterly part of the British North American mainland; area, 120,000 square miles; population, 3621 in 1921, as compared with 3965 in 1913. The leading activities of the population, mostly Eskimos and Indians with some whites, continued to be the fisheries and fur trapping. The Revillon Company appeared during the period to contest the supremacy of the Hudson's Bay Company in the field. The Grenfell Mission among the whites, and the Moravian Brethren among the Eskimos to the north, continued to make life supportable for the population. An attempt was made toward the settlement of the long-outstanding boundary dispute between Canada and Newfoundland in this region by the decision on the part of both governments in 1920 to submit the matter to the British Privy Council. A survey commission in December, 1920, revealed the importance

of the contested region by the discovery of rich forest lands and mineral areas.

LADD, ANNA COLEMAN (MRS. MAYNARD LADD) (1878-). An American sculptor, born in Philadelphia, Pa., who studied in Paris and Rome and in 1915 was elected an associate member of the National Society of Sculptors. One of her masters was Charles Grafly, an able technician. In most of her figures, Mrs. Ladd is concerned with the proper disposition of light by means of the modeling. Her work has strength and originality, and her preference is for imaginative subjects. She has, however, executed many successful portrait busts and bas-reliefs. Among her sculptures are: the "Spirit of Serbia," exhibited at the Rhode Island School of Design, "Bronze Lady," at the Gardner Collection, Boston, "Wind and Spray," in the Borghese Collection at Rome and the fountains in the Boston Public Gardens. During 1918, Mrs. Ladd conducted a studio in France for portrait masks for mutilated soldiers.

LAESSLE, ALBERT (1877-). An American sculptor, born in Philadelphia, Pa., who studied at the Spring Garden Institute, Drexel Institute and the Pennsylvania Academy of Fine Arts. He was a pupil of Charles Grafly and studied in Paris with Michel Béquine. He is best known for his studies of animal life, of which good examples are to be found in the Pennsylvania Academy of Fine Arts where three of his sculptures, "Turtle and Lizards," "Blue-Eyed Lizard," and "Chanticleer" are to be found. At the Carnegie Institute, Pittsburgh, his study, "Heron and Fish," is on exhibition. Other examples of his work are "Victory" and "Turning Turtle" at the Metropolitan Museum, New York, "Penguins" at the Philadelphia Zoological Gardens, "The Bronze Turkey" and "Billy" at the Philadelphia Art Club, and three small bronzes, "An Outcast," "Locust and Pine Cone" and "Frog and Katydid" at the Peabody Institute, Baltimore.

LA FARGE, CHRISTOPHER GRANT (1862-). An American architect (see **VOL. XIII**). From 1910 to 1915 he was a member of the firm of La Farge and Morris, and in 1918 became investigator and later assistant general manager of the United States Housing Corporation in Washington. He was an Associate of the National Academy and was former president of the Architectural League of New York. He was also a member of the Advisory Board of the School of Architecture of Princeton University and of the Advisory Council of the School of Architecture of the Massachusetts Institute of Technology. He was made honorary M. F. A. by Princeton in 1921.

LAFAYETTE COLLEGE. A college and school of engineering for men at Easton, Pa., founded in 1826. The institution grew steadily during the decade 1914-24, with an enrollment of 580 at the beginning of that time as compared with 970 at the close, a faculty of 50 members as compared with 80 in 1923-24, and a library of 30,000 volumes as compared with 57,000 volumes. The productive funds were increased from \$770,960 in 1917 to \$2,000,000 in 1923-24, largely through a \$1,000,000 endowment campaign in 1920; and the Helen H. P. Manson chair of Biblical literature, the Fred Morgan Kirby professorship of civil rights, the Simon Cameron Long professorship of civil engineering, and the John D. and Frances H.

Larkin professorship in chemistry were endowed during the period. Nine acres were added to the campus in 1922, and a new gymnasium costing \$325,000 was completed in 1924, as a memorial to Lafayette men in the War. President, John Henry MacCracken, Ph.D., LL.D.

LA FOLLETTE, ROBERT MARION (1855-1925). United States Senator from Wisconsin (see VOL. XIII). He was reelected successively from 1910 to 1923, and during that entire period dominated the Republican party in Wisconsin. He actively opposed, in 1916-17, all war preparations, and an attempt was made by the legislature of Wisconsin to deprive him of his office as Senator (see WISCONSIN). In spite of these efforts, he was reelected. Although he was absent from the Senate on account of illness for a large portion of the time in the latter part of the decade, his influence in the Senate continued to be great. In 1922, 1923 and 1924 he was able, by his control of so-called blocs in both the Senate and the House, to decisively affect the functioning of those bodies. In the Senate he controlled a group of members from the Western States who, in 1923-24, on account of the small margin between the Republican and Democratic membership, held the balance of power, and was able to affect legislation, to a large extent. This was true also in the House, where the Republican Representatives, from Wisconsin and other States, who were controlled by him were able, by combining with the Democratic party, to overthrow attempts of the Republican majority to pass important measures and to modify others. In 1924, he announced his candidacy for the presidency on an independent ticket. He had previously organized a so-called Conference for Progressive Political Action, composed chiefly of insurgent Republicans and Democrats and some members of the Farmer-Labor party. At a convention in Cleveland, in July, 1924, he was nominated for President. He also received the nomination of the Socialist party, although he had never been identified with Socialism. See UNITED STATES, *History*.

LA FOLLETTE SEAMEN'S ACT. See SHIPPING.

LAGERLÖF, (OTTLA LOUISA) SELMA (1858-). A Swedish novelist (see VOL. XIII) ranked among the greatest writers of her country. She took an active interest in communal affairs and served as member of the municipal council in her native county, Värmland, where with the aid of the Nobel Prize, she realized the dream of her life by restoring the ancestral estate. After 1914 she published: *Astrid* (1914); *Dunnungen*, a comedy (1914); *Stenen i sjön* *Rotenen* (1914); *En Emigrant* (1915); *Silvergrievan* (1915); *Drinman* (1916); *Her Bannlyst* (1918), known in the English translation as *The Outcast* (1920); *En saga oom en saga och andre sagor* (1919); *Ingmarssonerna* (1919); *Zacharias Topelius* (1920).

LAHM, FRANK P. (1877-). An American airman, born at Mansfield, Ohio, educated in France and the United States Military Academy in America. He won the first Gordon Bennett Balloon Race at Paris in 1906 and the National Balloon Race in 1911. Also, he organized army air service in the Philippine Islands. He was on active duty in France, 1917-19, being in charge of the Air Service of the Second Army A. E. F. (1918-19). In 1922,

he was air service representative of the War Department.

LATRD, JOHN (1887-). A British professor of philosophy. He was educated at the universities of Edinburgh and Cambridge. He became professor at Dalhousie University, Nova Scotia, in 1912 and was subsequently called to the chair of logic and metaphysics at Queen's College in the University of Belfast. He was the Mills lecturer for 1923-24 at the University of California. His writings include *Problems of the Self* (1917) and *A Study in Realism* (1920).

LAKE ERIE COLLEGE. An institution for women founded at Painesville, Ohio, in 1859. The number of students increased from 116 in 1914 to 186 in 1924, and the number of teachers on the faculty from 23 to 27. The library was recatalogued during the period and much dead timber withdrawn; it increased from 12,300 to 16,000 volumes. The productive funds rose from \$244,623 to \$365,340 and the annual income from \$59,388 to \$171,596. A gymnasium was built at a cost of \$181,863, a large residence hall was bought and converted into a dormitory, and a second was rented for the same purpose. A department of Spanish was created, and the department of psychology and education was separated from the department of philosophy. President, Vivian B. Small, LL.D., Litt D.

LAKE FOREST COLLEGE. An institution at Lake Forest, Ill., founded in 1857. There were 230 students and 21 members of the teaching staff in 1923. The library contained 37,000 volumes. Between 1914 and 1924, there was a gain of \$400,000 in the endowment, and the Swift central heating plant was built at a cost of \$90,000. The curriculum was adapted to modern demands with the development of courses in business administration, leading to the degree of Bachelor of Business Administration. President, Herbert McComb Moore, D.D.

LAMARCK THEORY, MODERN VIEWS OF. See HEREDITY.

LAMB, ARTHUR BECKET (1880-). An American chemist, born at Attleboro, Mass. He was graduated from Tufts College in 1900, and studied chemistry at Harvard, Leipzig, and Heidelberg. He was instructor in electrochemistry at Harvard, after which he was assistant professor and professor of chemistry and director of the Havemeyer Laboratory of chemistry at New York University. In 1912, he returned to Harvard where he has held similar appointments. During the War he was the chief of the chemical defense division of the Chemical Warfare Service with the rank of lieutenant-colonel and later was also director of the Nitrogen Research Laboratory. His original studies have been varied and include researches on such topics as the dehydration of periodic acid, isomycin in conimoric acid derivatives, the potential of iron, equilibria among cobaltamines, removal of carbon monoxide from air, and active charcoal, on all of which he has published the results of his investigations. In 1917, he became editor of the *Journal of the American Chemical Society*.

LAMME, BENJAMIN G. (1864-1924). An American electrical engineer, born on a farm near Springfield, Ohio, and educated at the Ohio State University. He was one of the four greatest electricians of his time, ranking with Edison, Steinmetz, and Tesla. Beginning with the Westinghouse Company in 1889 at \$30 a

month, he became its chief engineer in 1903. He had been but six months in the employ of the company when he had designed the double-reduction gear-railway electric motor. Later he devised the great "umbrella" generators which made possible the use of the power of Niagara Falls, the high-tension system of power transmission, the alternating-current system, and many other outstanding inventions. He was also a great teacher, and inspired a vast number of investigators throughout the world and in 1923 the Ohio State University, in giving him the Joseph Sullivan Medal, pronounced him "the greatest living mathematician." During the War he represented the American Institute of Electrical Engineers on the Naval Consulting Board and was chairman of the Board's Inventions Committee.

LAMONT, THOMAS WILLIAM (1870-). An American banker, born in Claverack, N. Y. He was graduated from Harvard in 1892, and for a time was engaged in newspaper work. From 1903 to 1909, he was secretary and treasurer and vice president of the Bankers Trust Company. He joined the firm of J. P. Morgan and Company in 1911 and was also a director and official in many important financial corporations. During the Peace Conference in Paris, he was one of the chief financial advisers of the American delegation. He also took a prominent part in the discussions on reparations held in London in July and August, 1924. In 1912, he was elected an overseer of Harvard University.

LAND BANKS. See AGRICULTURAL CREDIT.

LAND GRANT COLLEGES. See AGRICULTURAL EDUCATION; AGRICULTURAL EXTENSION.

LAND RECLAMATION. See RECLAMATION, LAND

LANDIS, KENESAW MOUNTAIN (1866-). An American jurist (see VOL. XIII). He served as judge of the Northern District of Illinois from 1905 to 1922, resigning in the latter year to accept the position of commissioner for the American and National Leagues of Professional Baseball Clubs, and National Association of Professional Baseball Leagues. In 1921, he acted as arbiter of building-trade disputes fixing the wage of all classes of building trades in Chicago.

LANDSBERGER, ARTHUR H. (1876-). A German writer, born at Berlin and educated at the universities of Berlin, Greifswald, Munich, Heidelberg and Paris. He spent some years in traveling and in 1907 joined Georg Brandes, Hugo von Hofmannsthal, Prof. Werner Sombart, Prof. Richard Muthé and Richard Strauss in the establishment of the magazine *Morgen*, which during its comparatively brief existence was at the head of German periodical literature. He is the author of *Das Kind mit den Vier Müttern* (1911); *Hass* (1916); *Lache, Bajazzo* (1916); *Die Neue Gesellschaft* (1917); *Feldpostbriefe eines Englischen Offiziers* (1917); *Bei Seinen Leuten* (1917); *Teufel Marietta* (1918); *Der Fall Horn* (1918); *Abenteuer* (1918); *Frau Dirne* (1918); *Wie Satan Starb* (1919); *Miss Rockefeller Filmt* (1920); *Was die Nacht mir Zuträgt* (1920).

LANE, FRANKLIN KNIGHT (1864-1921). An American cabinet officer (see VOL. XIII). He was appointed Secretary of the Interior by President Wilson, in 1913, and during his tenure took an active part in many important measures, and was considered one of the most

efficient members of the cabinet. He gave especial attention to the conservation of public resources. He retired from office on Mar. 1, 1920, on account of ill health. Shortly after, he became vice president of the Pan-American Petroleum and Transport Company. His letters were published in 1922.

LANE, RALPH NORMAN ANGELL (1874-). An English author and lecturer (see VOL. XIII). Among his later writings are: *The Dangers of Half-Preparedness* (1916); *Why Freedom Matters* (1916); *War Aims* (1917); *The Political Conditions of Allied Success* (1918); *The British Revolution and the American Democracy* (1919); *The Economic Chaos and the Peace Treaty* (1919); *The Fruits of Victory* (1921).

LANG, COSMO GORDON (1864-). Archbishop of York. He was educated at Glasgow University and Balliol College, Oxford. After studying at the Inner Temple in London, from 1883 to 1889, he entered the church and was curator of Leeds from 1890 to 1893. He served as vicar of St. Mary's, Oxford, from 1894 to 1896, and was created Bishop of Stepney in 1900. From 1901 to 1908, he was canon of St. Paul's Cathedral, and in the latter year was appointed Archbishop of York. He visited the United States in 1918. His published writings include *The Miracles of Jesus, as Marks of the Way of Life* (1900); *Parables of Jesus* (1906); *The Opportunities of the Church of England* (1906). He received degrees from many universities.

LANGDON, STEPHEN HERBERT (1876-). An American Assyriologist. He was born in Michigan and studied at the State university, at Union Theological Seminary in New York, at Columbia University, the Sorbonne and Collège de France in Paris, Leipzig and Oxford. He was deacon of the Church of England in Paris, 1905, and after 1908 was Shillito professor of Assyriology at Oxford. He is the author of *Annals of Assurbanipal* (1905); *Les Inscriptions du Wadî Brisa* (1905); *Babylonia and Palestine* (1906); *La Syntaxe du Verbe Sumérien* (1907); *Sumerian and Babylonian Psalms* (1909); *A Sumerian Grammar and Chrestomathy* (1911); *Neu-Babylonische Königsinschriften* (1912); *Babylonian Liturgies* (1912); *Tammuz and Ishtar* (1914); *Sumerian Epical and Liturgical Texts* (1915-17); *Le Poème Sumérien du Paradis* (1919); *Sumerian Liturgies and Psalms* (1919); and was editor of *Babyloniaca* (Paris, 1908-14).

LANGFELD, HERBERT SIDNEY (1874-). An American experimental psychologist. He was born on July 24, 1874, at Philadelphia, Pa., and was educated at Haverford College and the University of Berlin. In 1902-03 he served as Second Naval Attaché at the American Embassy in Berlin. He returned to academic work, and in 1910 became associated with the department of psychology at Harvard University. In 1919, he was appointed director of the experimental laboratory. His publications include, in addition to experimental monographs, a manual on *Experimental Psychology* (1916) and an empirical study of aesthetics *The Aesthetic Attitude* (1920).

LANGLEY AERODROME. See AERONAUTICS.

LANGLOIS, CHARLES VICTOR (1863-). A French historian, born at Rouen, and educated at the Lycée St. Louis in Paris. He was

admitted to the Ecole des Chartes, where he was graduated with honors. In 1912, he was appointed professor at the Faculty of Letters of the University of Paris and director of the national archives. He was admitted to the Institute of France in 1917 as a member of the Academy of Inscriptions and Belles Lettres. He was also member of the Commission for the Literary History of France. He was the author of: *Le Règne de Philippe III* (1887); *Les Archives de l'Histoire de France* (1891-93); *Manuel de Bibliographie Historique* (2 vols., 1896-1904); *L'Inquisition* (1902); *Histoire du Moyen Age* (1901); *Questions d'Histoire et d'Enseignement* (1902); *Histoire de l'Écriture en France* (1904); *Introduction aux Etudes Historiques* (1905); in collaboration with Professor Seignobos). The last-named work was translated into English.

LANGMUIR, IRVING (1881-). An American chemist, born at Brooklyn, N. Y. He was graduated at Columbia University and later studied in Göttingen, where he received his Ph.D. in 1906. He was instructor in chemistry at Stevens Institute of Technology but in 1912 became research chemist to the General Electric Company in Schenectady, N. Y., where he devoted much attention to the development of gas-filled tungsten lamps, besides electron discharge apparatus, and devised a high vacuum pump. These have gained for him the Nichols medal of the New York Section of the American Chemical Society in 1915 and in 1920, the Hughes medal of the Royal Society of London in 1918, and the Rumford medals of the American Academy of Arts and Sciences in 1920. During the War he made special experiments on devices for the detection of submarines at the Naval Experiment Station at Nahant, Mass. See **CHEMISTRY**.

LANSDOWNE, HENRY CHARLES KEITH, fifth MARQUIS OF (1845-1927). An English public official. He served as minister without portfolio in the Coalition Cabinet in 1915-16. At the end of the War he took a moderate attitude in regard to peace, and published several proposed plans, parts of which were incorporated in the Treaty of Versailles.

LANSING, ROBERT (1864-). An American lawyer and public official (see Vol. XIII). Shortly after assuming the office of counselor for the State Department, he succeeded William Jennings Bryan as Secretary of State, holding that office until 1920, when he was dismissed by President Wilson for alleged usurpation of the latter's authority by calling cabinet meetings during the latter's illness. He was a member of the American Commission to Negotiate Peace at Paris in 1919 and published *The Big Four and Others at the Peace Conference* (1921) and *The Peace Negotiations* (1922). Following his retirement from the cabinet, he practiced law in New York City.

LANSING-ISHII AGREEMENT. See **JAPAN, History**.

LAOÑ. See **WAR IN EUROPE, Western Front**.

LAOS. See **FRENCH INDO-CHINA**.

LAPARRA, RAOUL (1876-). A French composer, born at Bordeaux. He studied at the Paris Conservatoire under Fauré and Massenet, and won the Prix de Rome in 1903 with a cantata, *Ulysse*. He gained international reputation with his opera *La Habanera* (Paris, 1908; Boston, 1910; Metropolitan Opera Company,

1924). Also operas are *Pearl of the East* (Bordeaux, 1899), *La Jota* (Paris, 1911), and two not yet produced (1924), *Amphitryon* and *L'Avanture pittoresque*. He also wrote incidental music to *El Conquistador*, a violin sonata, and interesting pieces for piano.

LARDNER, RING W. (1886-). An American writer, born at Niles, Mich. He served as a sports writer for many different newspapers, including the *Chicago Tribune* and *Boston American*. His books include: *Bib Ballads* (1915); *You Know Me, Al* (1915); *Gullible's Travels* (1917); *Own Your Own Home* (1917); *Treat 'Em Rough* (1918); *The Real Dope* (1918); *The Young Immigrants* (1919); *The Big Town* (1921), and *How to Write Short Stories* (1924). As a fictionist he was first known for his humorous and slangy genre sketches of the sporting world, his baseball players and Broadway hangers-on being depicted with fidelity and kindness. His *How to Write Short Stories* seemed to be approached in the same light spirit, but the stories which composed the volume indicated a matured artistic attitude and a seriousness of purpose, in the handling of his typical American lower middle-class characters, that at once prompted critics to group the work with Masters's *Spoon River Anthology* and Anderson's *Winesburg, Ohio*.

LASKI, HAROLD J. (1893-). An English political philosopher, born at Manchester, and educated at New College, Oxford. During 1916-20 he was a lecturer at Harvard University and gained wide attention in the United States for the freshness of his point of view and his remarkable erudition. In 1920 he returned to England to join the London School of Economics, and in 1923 he became political science reader at the University of London. His works on the problem of sovereignty in the modern state, with their insistence on political and economic decentralization—*The Problem of Sovereignty* (1917), *Authority in the Modern State* (1919), and *Foundations of Sovereignty* (1921)—were hailed as the most important contributions to the political thought of the period. He showed his familiarity with the history of political thinking in his masterly summary, *Political Thought from Locke to Bentham* (1920). He edited a volume of Burke's *Letters* (1920) and Morley's *Essay on Burke* (1924).

LASKY, JESSE L. (1880-). An American moving picture producer, born at San Francisco, Cal. He was educated in the schools of San Francisco and was for a time reporter on newspapers in that city. After experiences in Alaska and Hawaii, he entered the theatrical business with Henry B. Harris in New York City. In 1914, he organized and became president of the Jesse L. Lasky Feature Play Company, which was afterwards merged with the Famous Players-Lasky Corporation, and with large studios at Hollywood, Cal. He was one of the most important figures in the development of moving pictures.

LASSITER, WILLIAM (1867-). An American soldier, born in Petersburg, Va. He graduated from the United States Military Academy in 1889, and was commissioned in the artillery, in which he served during his military career. He saw service in the Spanish-American War and was on duty with the General Staff in 1911 and 1913. He was commis-

sioned brigadier-general in the National Army in 1917, and major-general in the following year. He was chief of artillery for the 1st Corps in 1918 and served in the same capacity with the 2d Army later in the same year. He was commander of the 32d Division in 1918-19, and was chief of artillery of the 3d Army in April, 1919. In August of that year he returned to the United States. From 1921 on he was chief of staff in charge of operations and training.

LATANÉ, JOHN HOLLIDAY (1869-). An American educator, born at Staunton, Va. He graduated from Johns Hopkins University in 1892 and after serving as acting professor of history and economics in the Baltimore City College, he became master of history and English at the Military College at San Rafael, Cal. From 1898 to 1902, he was professor of history and economics at Randolph-Macon Woman's College, and from 1902 to 1913, professor of history at Washington and Lee University. In 1913, he became professor of American history and head of the Department of History at Johns Hopkins, and in 1919, dean of the college faculty. He was a member of many learned societies and wrote *From Isolation to Leadership* (1918) and *The United States and Latin America* (1920).

LATOURETTE, KENNETH SCOTT (1884-). An American educator, born at Oregon City, Ore. He was graduated at Yale in 1906 and was a member of the faculty of that university until 1909. For a time he served as traveling secretary of the Student Volunteer Movement of Foreign Missions, and from 1910 to 1917 was a member of the faculty of the college of Yale in China. In 1914, he became a member of the faculty at Reed College, Portland, Ore., afterward going to Denison University. In 1921, he became professor of missions at Yale. He was ordained to the Baptist ministry in 1918. Among his works are: *History of Early Relations Between the United States and China, 1784-1844* (1917); *Development of Japan* (1918); *The Christian Basis of World Democracy* (1919).

LATTER-DAY SAINTS. See REORGANIZED CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS.

LATVIA. One of the Baltic Succession States arising out of the War, formerly part of the Russian Empire. It is made up of the former Russian province of Courland, the southern half of the former province of Livonia, and the western part, amounting to about one-third, of the former province of Vitebsk. It covers 25,402 square miles of territory, with a coast line of 338 miles and a total frontier line of 1040 miles, bounded by Esthonia on the north, Russia on the east and Lithuania on the south. Total population, 2,552,000 in 1914; 1,885,870 in 1923. Capital, Riga. For adminis-

trative purposes it is divided into four districts. The census of Jan. 1, 1923, divided the population into the following ethnic groups: 72.6 per cent Letts, 5.7 Russians, 5.0 Jews, 4.2 White Russians, 3.6 Germans, and 3.3 Poles. Of the total population, 76 per cent was rural. Density per square mile was 74.5. By occupations: 56 per cent agricultural, 18 per cent in industry, and 6 per cent in trade. About 60 per cent of the population was Protestant. Catholic majorities were to be found in Latgale and parts of Courland. Population of chief towns, 1923: Riga, 280,000 (517,552 in 1913); Libau, 71,700; Dunaburg, 39,000; Mitau, 24,000; Windau, 10,000.

Production. Total rural area, 16,435,000 acres. Of this, arable land, about 4,500,000; meadows, 2,200,000; pasture land, 2,400,000; forests, 4,791,000, waste land, 2,544,000. By the agrarian law of Sept. 16, 1920, the largest estates were nationalized for partition among the great landless peasantry. By 1922, the distribution was as follows: larger estates or farms, numbering about 200,000, occupying 7,449,140 acres, peasant holdings, about 50,000, with 6,093,620 acres; state lands, 1,550,500 acres; church lands, 167,330 acres. The country was only slowly recovering from the effects of the War, as shown by the crop statistics. In 1923, there were 338,000 horses (320,000 in 1913); 900,000 cattle (912,000 in 1913); 484,000 swine (557,000 in 1913); 1,461,000 sheep (996,000 in 1913).

Industries showed steady expansion. In 1921, there were 1709 industrial enterprises, employing 28,643 people; in 1922, 1906 with 74,000 h.p. and 31,827 employees; in 1923, 2130 with 83,807 h.p. and 33,961 employees. In 1914, in Riga alone, 65,000 workers were employed. Lumber yards employed 6973 hands in 1923; metal working establishments, 6545; foodstuffs manufacturing enterprises, 5558; textile mills, 4267; paper mills, 3938. There were about 100 incorporated concerns, with approximately 50,000,000 lats stock capital.

Trade. The volume of trade was growing year by year, as shown by the following comparison:

Year	Imports (In lats; 1 lat=\$0.193)	Exports
1921	70,697,355	29,264,991
1922	107,370,110	101,992,006
1923	211,872,035	161,929,052

The chief articles of import in 1923 were: Manufactured, semimanufactured goods, i.e. wool and woolen yarn, iron and steel products, hides and leather, petroleum; manufactured goods, i.e. cotton and woolen goods, machinery, implements; foodstuffs, i.e. grain and flour, sugar, herring, tobacco. Chief among commodi-

Crops	PRINCIPAL CROPS OF LATVIA			Production in thousands of bushels		
	Area in acres					
	1909-13 (average)	1922	1923	1909-13 (average)	1922	1923
Rye	866,800	583,600	800,700	12,823	6,851	10,760
Oats	755,700	675,300	928,000	19,225	18,173	17,649
Barley	471,700	387,000	531,000	7,933	6,765	6,397

Flax and flaxseed	272,000	93,100	169,300	55,672	31,351	41,517

* Metric Tons.

ties exported were: lumber, 42,165,000 lats; other wood materials, 13,650,000 lats; flax and flax tow, 41,559,000; precious metals, 10,154,000; butter, 9,272,000. By countries of origin, 1923 imports were distributed as follows: Germany, 95,850,000 lats, United Kingdom, 36,087,000; Lithuania, 11,345,000; Netherlands, 10,381,000; Poland, 8,319,000; Russia, 7,553,000. Main countries of destination of exports: United Kingdom, 74,967,000; Belgium, 31,961,000; Germany, 12,281,000; France, 10,719,000; Russia, 5,963,000.

Transportation. Length of railroads, 1839 miles (1923). Number of locomotives 320, freight cars 5324, passenger cars 467. At the beginning of 1924, Latvia's shipping included 31 steamships of 38,310 registered tons, 56 sailing vessels of 9129 tons, and 9 motor ships of 993 tons, making a total of 96 ships, aggregating 48,432 tons. This represented a long stride toward restoration of the country's prewar merchant fleet, which on Jan. 1, 1914, comprised 59 steamers of 77,626 registered tons, and 274 sailing and motor vessels of 49,093 tons, but which by the end of 1921 had decreased 75 per cent, or to 34,021 tons. Vessels entering Latvian ports in 1923: 3577, of 1,442,130 net tons capacity; cleared, 3571, of 1,431,500 tons.

Finance. For the year 1921-22 the budget balanced at 9,855,893,800 Latvian rubles (about \$32,852,800); for the year 1923-24, it balanced at 174,383,390 lats (roughly \$33,604,747, at the exchange rate of 1 lat to \$0.193). On Oct. 1, 1922, it was stated that the national debt was as follows: to United States, \$2,521,870; to American Relief Administration, \$2,610,418; to Norway, 6,737,558 crowns; to Great Britain, £20,169; to France, 1,741,516 francs; to private banks, £178,400. In the middle of 1923 the total foreign debt amounted \$6,620,460. The internal debt amounted to \$96,500. There were in circulation, Dec. 31, 1923, 23,000,000 lats. On Nov. 1, 1922, the Bank of Latvia, in which the government was the chief stockholder, was opened. In June, 1922, the lat (\$0.193) became the unit of currency, and during 1922 and 1923 the government maintained it at par.

Education. At the beginning of 1922, there were 1725 elementary schools with 165,598 pupils and 5530 teachers. There were 107 secondary schools with 15,080 pupils. By the census of 1920, it was established that 70 per cent of the population could read. National minorities were taught their native languages in government schools, which numbered 410 of the total 1725 elementary schools. In 1919, the Riga Polytechnic was raised to be the Latvian University. In 1922, there were 5421 students and 161 instructors.

History. Early in 1918, as a result of the uncertainty engendered by the Russian Revolution and the threatening gestures of the peasants, German forces were invited by the Baltic barons to occupy Latvia. The Bolshevik troops were compelled to retire, and German troops invested the country. A German army of occupation was allowed to remain even after the Armistice, for the Allies were not yet prepared to guard the country against Russia. (See **BALTIC PROVINCES**.) Immediately after the Armistice, on Nov. 18, 1918, independence was declared and a government formed by the moderate, or peasant, element. Bolshevik troops at once invaded the new state, captured Riga early in January, 1919, expelled the Latvian

government, and set up a Soviet government. War was waged intermittently throughout the year, the chief Latvian force being a Baltic *Landwehr*, officered by Germans. In May, the Bolsheviks were driven from Riga, but the fear of German preponderance made the native Letts seek aid from the Allies. The Ulmanis government (the peasant parties) was recognized and an Englishman was placed in charge of the *Landwehr*, which thus became the official Lettish force. Latvia now (1919) became a battleground as a result of the Allied determination to attack Russia by way of the Baltic provinces. A "White" Russian-German force overran the country, ostensibly to engage Bolshevik troops along the Narva and the Duna lines. There was fighting late in 1919 in which Letts, German mercenaries, "White" and "Red" Russians were engaged. Riga was besieged for four weeks in October-November, 1919; the Letts were compelled to take up arms against the German army under General Bermond; Mitau was evacuated by the "White" Russian-German forces; and finally in January, 1920, after months of pillaging, the German troops consented to evacuate Courland. Another blow was struck for Latvian independence when the Lettish national *Landwehr* defeated the Bolsheviks in Latgallia. Thus, by 1920, the native Letts for the first time were in sole occupation of their territory. Negotiations with Russia soon commenced and on Aug. 11, 1920, a Russo-Latvian treaty was signed at Riga. Its main provisions were: an ethnographic frontier for Latvia; a large timber concession to Latvia; nonliability for Russian state debts; disarming of anti-Bolshevik troops in Latvia; free transit for Russian goods across Latvian territory; payment to Latvia of 4,000,000 gold rubles.

A Constituent Assembly, called in 1920, completed a national constitution on Feb. 15, 1922. A parliament (*Saeima*) elected by universal suffrage and based on proportional representation, which chooses the state president, was provided for. The prime minister, in turn, was to be designated by the state president. The first Parliament, elected on Oct. 7, 1922, was controlled by a Social Democrat bloc, with the peasant and minority parties in the opposition. Of the last there were no less than 17 distinct groups having a total of 41 members. A new government formed June 10, 1923, was supported by a coalition of the Peasants' League, Democrats of the Centre, and Right Socialists, with the premiership held by the head of the Peasants' League. After recognition of Latvia by the Supreme Council, the country was admitted to the League of Nations on Sept. 22, 1921.

Russian influence in Latvia became marked again late in 1922, when a Baltic Alliance was formed between Russia and her Succession States. This understanding provided among other things for an economic alliance, disarmament, and agreement on customs, consular, and trade matters in order to facilitate the Russian transit trade via the Baltic ports (see **ESTHONIA**). There was thus, as a result of a peaceful foreign and domestic policy, every indication in 1924 that the country was proceeding along the right road to economic well-being. The government's attitude toward the new farmers was paternalistic; a stabilized currency encouraged industrial growth; social conditions, e.g. housing, wages, sanitation, were favorable; and by commercial treaties negotiat-

ed with Czecho-Slovakia, Hungary, England, and France, the movement toward the consolidation of the trade frontiers was gaining headway.

LAUSANNE CONFERENCE AND TREATY. See **PEACE CONFERENCE AND TREATIES**; **TURKEY**, etc.

LA VERNE NOYES FOUNDATION. See **EDUCATION IN THE UNITED STATES**.

LAW, ANDREW BONAR (1858-1923). A British statesman see (VOL. XIII) On the formation of the first Coalition Cabinet in 1915, he was appointed Secretary of State, and in the first Lloyd George ministry in 1917, he became Chancellor of the Exchequer, and in this capacity introduced the budget in May, 1919. Owing to the constant absence of the Prime Minister in 1916-19, he acted as leader of the House during that period. He was also a member of the War Cabinet. In 1919, he was the plenipotentiary to the Peace Conference. After the general election of December, 1918, he became Lord Privy Seal and leader of the House. He headed the Conservative revolt from the Coalition Cabinet in 1922, and contributed largely to the victory of the Conservative party, in October of that year, and was chosen Prime Minister and head of the Conservative government. He resigned on account of ill health and died on Oct. 30, 1923.

LAW, INTERNATIONAL. See **BLOCKADE**.

LAW, PROGRESS OF THE. Law may be said to be the totality of rules prescribed by the proper authority for the regulation of society. One of the inherent qualities of law is its stability. The permanency of the content of law is generally attributable to two factors: (1) the recognition that there are basic principles in the legal order which are final and immutable, and (2) the practical expediency which necessitates an adherence to settled rules. As Blackstone expressed the first element: "These are the eternal, immutable laws of good and evil to which the Creator Himself in all His dispensations conforms; and which He has enabled human reason to discover, so far as they are necessary for the conduct of human affairs." Out of this acceptance of a natural law is derived the doctrine of natural rights which has played an important part in shaping the course of American constitutional law. There is also a practical reason for the rigidity of positive law. The common law is a barrier against arbitrary decisions of the judiciary. Safety demands certainty in the administration of law. But the doctrine of *stare decisis* and the force of precedent are not alone based upon the assumption that individualization is unwise; society postulates a body of legal rights and duties which are predictable, vested interests which are determinable and fixed.

It does not follow, however, that the law is a static and unchangeable picture. Law must possess a considerable degree of rigidity, but it also possesses elasticity and adaptability in order to meet current social and economic changes. Courts and legislatures are constantly at work altering, amending and adding to legal rules. The growth of industry, the increase of poverty, the shortage of homes and similar emergencies of the time and place must be faced and solved as they arise. The automobile, the radio and the aeroplane, to mention only a few modern inventions, bring about novel complications which are rapidly translated into legal problems. The pronounced centralization in urban

communities increases friction and conflict of societal relations which are frequently absent in rural life. It is the task of the jurist and the legislator to view these penetrating influences of the day and to readjust the juristic machine to meet the current changes in the social order.

We therefore find that the law is made up of the contrasted forces of permanency and change. One of the most troublesome questions of juristic science is to apportion the contesting principles of certainty and flexibility in the growth of law. How far should the courts be permitted to go in the readjustment of law to fit the particular case? Is it preferable to have a settled rule or discretionary power in the administration of justice? At the present time, the movement of law seems to be in the direction of an enlargement of discretion, an extension of the so-called individualization of law. Courts are manifesting a keener interest in the practical effect of social and economic changes upon the established principles, and a willingness to upset these legal formulas in certain cases. The expansion of discretion is evident in the creation of administrative boards and commissions which have taken over functions formerly exercised by the judiciary. These extra-judicial groups are given considerable latitude in the decision of particular cases. But the common-law emphasis upon stability as a barrier against the whims of capricious judicial and administrative action is still a substantial ingredient in the progress of American law. Natural law with its assumption of basic norms to test the validity of given laws, while rejected by pragmatic philosophers of law, may be noted in the current language of the courts.

The scope of this article embraces a general survey of recent developments in the major branches of law. It attempts to outline the current tendencies of juristic science; its partial acceptance of the need of readjustment of legal principles to meet changing conditions in society; its stern insistence upon the retention of the doctrine of *stare decisis* as a check against arbitrary decisions; and the proposals of reform which are intended to perfect the law as an instrument to accomplish justice.

Constitutional Law. The panorama of constitutional law portrays the course and progress of law in general. Basic principles of the Constitution are so closely interwoven into the fabric of American law that contemporaneous evolution, particularly in statutory law, usually raises questions of constitutional usurpation. Novel experiments of legislation introducing changes in the customary law inevitably must be weighed and tested by the clauses of our organic law before their validity is finally determined.

Of late there is growing up among the justices of the United States Supreme Court a difference of opinion regarding the scope of judicial review in gauging the constitutionality of State and Federal legislative acts. On the one hand, there is the assumption that the Supreme Court is empowered to investigate the "reasonableness" of the given statute and to analyze the necessity, utility and efficacy of the proposal. On the other hand, this broad power of review is contested by a minority of the Supreme Court on the ground that such latitude virtually makes the Supreme Court a super-legislature; and that the Supreme Court can-

not impose its own views of the wisdom of legislation in cases where the law does not offend any clause of the Constitution. A concrete and striking illustration of this division of judicial opinion may be noted in the important Minimum Wage Case, decided in 1923. The primary question was the constitutionality of the Act of Congress establishing a Minimum Wage Commission in the District of Columbia for the purpose of fixing a minimum wage for women and children. The majority of justices declared that the statute was unconstitutional because it violated the guarantees of due process of law. Their prevailing opinion analyzes the social, ethical and economic validity of the minimum wage, rejects the opinions of social workers as "only mildly persuasive" and draws the subtle distinction between the limitation of the hours of labor and establishment of a living wage. This range of judicial inquiry is strongly resisted in the minority opinions in the Minimum Wage Case. It is argued therein that it is not within the province of the Supreme Court to hold Congressional acts invalid simply because they contain economic formulas which members of the Supreme Court believe to be unwise or unsound.

Whatever may be the ultimate outcome of this present divergence of judgment in the matter of constitutional interpretation, it may be safely stated that the flexible clauses of the Constitution necessitate a considerable degree of individual infiltration in the solution of new problems of social and economic reform. The political, ethical and economic theories of the judges cannot be entirely eradicated in the application of the generalizations of the Constitution. Changes in the personnel of the Supreme Court, following resignation or death, sometimes result in the retardation of social legislation. Thus it has been asserted that the Minimum Wage decision was an accident of time; that an earlier hearing would probably have sustained the constitutionality of this law. This does not imply that the opinions of the Supreme Court involve the stubborn and willful assertion of individual prejudices. But it does mean that the latitude of the clauses of the Constitution inevitably permits a rather generous display of personal judgment regarding the meaning of the given section of the organic law.

Due Process of Law. One of the most frequent sources of constitutional litigation is the "due process of law" clauses of the Fifth and Fourteenth Amendments. The State and Federal governments are herein prohibited from depriving any person of "life, liberty or property" without the orderly and settled usages of law. The all-embracing language defies exact and indelible definition, but its inherent importance makes it the basis for frequent attacks upon current legislation. The decisions interpreting the due process clause may be divided into two classes: (1) those pertaining to life and liberty, and (2) those particularly applicable to property rights. This classification, while convenient, is not strictly accurate, since many decisions involve at once an alleged invasion of personal and property rights.

Life and Liberty The right to be free from unlawful physical restraint is of the essence of life and liberty. This right is scrupulously upheld unless the exercise of it interferes with the public welfare. A limitation of the right of freedom of the person is found in the case of

compulsory vaccination, which has been held to be constitutional and not violative of the liberty of the individual. But liberty means not only the right to be free from physical duress but also to use freely one's faculties in lawful ways, to live and to work, to make contracts without undue interference from the State. It is said that liberty of contract is the rule and its curtailment is the exception. But the general rule has suffered many invasions which have been declared to be constitutional. Many recent laws have been passed restricting the freedom of contract in the interest of the public. The whole compass of workmen's compensation legislation, laws regulating the hours of labor, statutes restricting the power of the husband to mortgage household goods or assign wages, regulation of the insurance by the State, are current types of laws which invade the former generalization, liberty of contract.

Some of the modern literature of law maintains the view that liberty of contract is a fiction of judicial minds which has been read into the Fourteenth Amendment, a result of the "innocuous generality" of liberty to follow the ordinary callings of trade. It has also been claimed that this concept of liberty is due to the acceptance of Sir Henry Maine's doctrine that the evolution of law discloses a progress from status to contract. While it is true that the expression, "liberty of contract," is not found in the Fourteenth Amendment and that the common law has made inroads into the Sir Henry Maine formula, it is equally certain that there are individualistic tendencies in the common law, and more particularly in American law and traditions, that compel the courts to move slowly in overthrowing this freedom of individual action in commercial pursuits. We may follow this hesitancy of the courts in the judicial nullification of legislation which invades the right of contract. In 1910, the New York Court of Appeals declared the workmen's compensation law to be unconstitutional and a minority of the Supreme Court of the United States held a similar view as late as 1920. The correct principle, at least the present legal formula, seems to be that liberty of contract is embraced within the definition of liberty in the Fifth and Fourteenth Amendments. But there exists the potential and limited right to curtail this liberty of contract when the invasion is justified by the public interest and the social welfare.

This endeavor to balance the right of free contract and the police power of the State is visible in recent pronouncements of the Supreme Court. The State may prescribe conditions of employment on public works because this is work of a public character, but the State cannot determine wages between employer and employees in private employment, even when the legislature declares that a business is affected with a public interest. This distinction was sharply drawn by the Supreme Court in its analysis of the Kansas Industrial Court insofar as the Kansas Industrial Court attempted to regulate wages in industrial enterprises. The State may regulate insurance rates, since this business directly touches the public welfare, but the State cannot establish a minimum wage for women because, in the words of Mr. Justice Sutherland, it is "not a law dealing with any business charged with a public interest."

Property Rights. The conservation of the right of property is clearly within the purview

of the due process clause of the Constitution. This right, however, is not absolute, but may be partially or even completely extinguished when the public interest requires it. The most striking example of the relativity of property rights, excluding the right of eminent domain, may be noted in the operation of the Eighteenth Amendment prohibiting the manufacture and sale of intoxicating liquors. This Amendment automatically prevented the use of property and instrumentalities for the forbidden purposes and thereby materially lessened the value of these properties without compensation. Similar laws and statutes restricting or prohibiting the sale of food products have been held to be constitutional since they were passed to safeguard the public health. A familiar restriction is the "blue-sky" law which conditions the sale of securities without a State license. Laws regulating the height of buildings, "zoning" laws and ordinances prohibiting or taxing the use of land for billboards, all of which have been declared to be constitutional, are modern illustrations of the lawful invasion of the individual's property rights.

Equal Protection of the Laws. The Fourteenth Amendment, in addition to its provision establishing and guaranteeing due process of law, provides that all persons within the jurisdiction of the State shall be accorded "equal protection of the laws." This important phrase secures equal treatment to all persons in the enjoyment of their rights and privileges. Equal protection does not prevent the State from classifying portions of the people according to their particular relations, but this classification must be based upon some real difference which separates the class affected from the other groups in the social order. This constitutional guarantee was originally incorporated to secure to the colored race, then recently emancipated, the complete enjoyment of their freedom, but the Amendment is not confined to racial inequalities. Within its original purpose may be noted the cases that consider the constitutionality of legislation which establishes separate schools for white and colored children, separate coaches and stations in railroad service. These statutes have been validated on the ground that equality of laws does not necessitate intermixture of the races socially, provided that both races are given similar accommodations. But when a State passed a law prohibiting a colored person from buying property in a white district, and imposed the same restriction upon a white person purchasing property in a colored section, the Supreme Court held that this provision, although aimed to lessen racial strife, exceeded the power of the State and violated the guarantee of equal protection of the laws.

Laws that classify distinct groups in the community are valid provided that the distinction is not arbitrary or unreasonable. For instance, the State may pass special regulatory statutes controlling insurance companies, banks, grain elevators and mines. Such legislation may impose various forms of licenses, different rates of taxation and varied modes of control without offending the equal-protection clause. The employer-employee relation has been especially subject to particular legislation. Laws control hours of labor, working conditions and safety appliances. But arbitrary discrimination will be inhibited in industrial legislation. In a recent case the Supreme Court held a statute of

Arizona to be unconstitutional which prohibited the use of injunctions in labor disputes, although a vigorous dissent to this decision was registered by four justices.

Police Power of Government. The police power inherent in government balances and limits the liberty of the citizen for the common good. The boundary of the police power is shadowy and uncertain. It sometimes includes a consideration of the limits of legislative power, sometimes a discussion of the conflict of State and Federal authority, and frequently the vague definition of the public welfare and individual right. Police power lies at the base of all those laws which curtail the freedom of contract, regulate the conduct of business, impose restrictions upon the use of property and protect the health and safeguard the morals of the citizenry.

This necessary power of government is broad and flexible. It was recently invoked to curb the property rights of landlords during the housing shortage by the passage of emergency rent legislation. Congress was exercising the police power when it passed the temporary wage scale for railroad employees in connection with the Adamson Eight-Hour Law. The States also are possessed of a similar power which the Federal government must respect within its proper limits. The dividing line between the State and Federal police power is sometimes rather uncertain. The Congress may not, under the guise of taxation or regulation of interstate commerce, usurp the police power of the State. An important application of this principle of the separateness of the police power may be seen in the Child Labor Cases. In these cases, Congress attempted to bar from interstate commerce in the first case, and to tax in the second case, the products of child labor in the States. Obviously the primary purpose was not to regulate commerce or to tax, but simply to reach out and to control intrastate affairs. Both statutes were declared to be unconstitutional as an invasion of State sovereignty.

The strong stand of the Federal judiciary against the covert entry and domination of State business by Congressional acts is wise and necessary. The palpable need of child labor laws is generally conceded. But the duality of our scheme of government negatives the right of Congress to infringe upon the reserved police power of the States to accomplish a worthy end. If this pronounced trend toward centralization were to continue, local government would become a mere name. The Federal government could through the extension of the power to regulate commerce virtually dominate the remote activities of the State. These excursions into States' rights have reached the peak, and the attitude of the Supreme Court gives support to the belief that further encroachments will not be successful.

But the police power of the State is not without limits even in its local environment. The exercise of the police power must bear a tangible relation to the governmental power and a due recognition of individual rights. Thus a State may lay a tax upon or forbid the manufacture and sale of obnoxious and harmful foods such as oleomargarine, or the use of benzoate of soda in nonfermented beverages. A wide latitude even to the point of caprice has seemingly been allowed in State legislation. But the line against excessive and arbitrary pro-

hibition is still drawn, although the separation is often difficult to define. The German language cases, decided in 1923, illustrate the possible misuse of police power by the State. Several States passed laws forbidding the instruction in any foreign language of any children under a certain age or school grade. Without questioning the power of the State to compel attendance and to make reasonable regulations for all schools, the Supreme Court held that the restriction was beyond the power of the State and violative of individual rights. A more extreme form of the same radical exercise of State control is the Oregon Compulsory Public School Law, which prohibits the instruction of children between the ages of 8 and 16 in private schools and compels attendance in public schools. Reinforced by the attitude of the Supreme Court, in the German language cases, the United States District Court for the District of Oregon declared that the Oregon Compulsory School Law infringed upon the liberties of the parents, invaded the property rights of the private institutions affected and usurped the natural and inherent rights of parochial and private schools to teach. These laws indicate in the field of State legislation a present tendency to strain the powers of sovereignty to the breaking-point, and to transgress unduly the reserved rights of the people in accordance with the Bill of Rights, most of which are found in the first 10 amendments to the Federal Constitution.

The Eighteenth Amendment. The advent of Prohibition as a national policy has presented many important and original legal questions. The Supreme Court upheld the validity of the Eighteenth Amendment and the constitutionality of the National Prohibition Act which was passed to enforce the Amendment. The enforcement of the law at once raised the question of the territory subject to the provisions of the Act. Did it extend to foreign or domestic ships in territorial waters of the United States? It was decided by the Supreme Court that the Amendment prohibited "transportation" and "importation" of intoxicating liquor into the United States "and all territory subject to the jurisdiction thereof." This territorial control, it was held, included a marginal belt of three geographic miles from the coast line, and extended to all ships, whether foreign or domestic, entering this zone; but it was also held that the National Prohibition Act did not extend to domestic vessels when outside the territorial waters of the United States.

The Eighteenth Amendment provides that Congress and the several States shall have concurrent power to enforce this Amendment by appropriate legislation. Pursuant to this concurrent jurisdiction many States passed local enforcement laws. This dual administration of prohibition raised the question whether an individual could be punished twice for the same violation, once by the Federal and again by State authorities. The question was answered by the Supreme Court to the effect that the Eighteenth Amendment was a limitation and not a grant of power to the States, and that the same act may be an offense against both the State and Federal governments without offending the "double jeopardy" provision of the Fifth Amendment.

Contracts. Social, economic and commercial changes cause corresponding changes in

the branches of the law immediately affected. In an era of expanding commerce and industrial growth based upon credit and confidence, it is inevitable that contracts should enter into a majority of mercantile transactions. The preliminary agreement, the sale of goods, the conveyance of land, the issuance of instruments of credit, the guarantee of payments, the formation of partnerships and corporations, all these business relations necessitate the passing of promises which form the central field of contract law. Due to the fluctuating problems of commerce, the law of contracts discloses renewed signs of activity. The fundamental questions of offer and acceptance, consideration and the like are being reopened and debated in the light of modern business requirements. One of the litigated enigmas of contracts is the definition of the real elements of a promise which will render the promisor legally liable to the promisee. Is it necessary for the promisee to give or to promise to give an equivalent value to the promisor? Or is it sufficient that the parties make a business bargain independent of the relative value of the respective promises or acts? Or does it suffice that a promise is made which is relied on by the promisee without the promisor's assumption of any affirmative obligation?

These queries outline the conflicting theories of the nature of consideration. Dean Roscoe Pound has styled them respectively as (1) the equivalent theory, (2) the bargain theory, and (3) the injurious-reliance theory. The leading theory to-day is the bargain theory, which validates all promises which arise out of a give-and-take bargain. Under this view, it is not fatal that the more exacting requirements of the equivalent theory are missing. But there is a perceptible effort being made by the courts to enlarge the scope of contractual liability according to the mandates of the so-called injurious-reliance theory. This latter theory may seem to be too idealistic in that it seeks to impose a liability for a promise which is not balanced by a corresponding promise from the other party to the agreement. But it is predicated upon the sound ethical doctrine that it is not right for a man to violate his promises even when they are gratuitous. Certainly it is unfair to do so when the promisee acts upon the assumption that the promise will be fulfilled and suffers damage by reason of his reliance. Despite the undercurrent of support for the reliance theory, the prevalent definition of consideration includes the element of mutual undertakings by both parties.

Standardization of the law of contracts has made appreciable progress in certain branches. Insurance contracts have been made uniform by legislation. Negotiable instruments, sales, bills of lading, warehouse receipts, stock certificates and partnerships have been subjects which are governed by uniform acts in many States. Ambitious attempts have been made in a few States to reduce the whole field of contract law to a code; but the attempts have been premature and generally unsuccessful. Codification must involve a restatement of the law; and the difficulty is that one cannot restate that which has not yet been definitely stated. The conflicting theories must first be evaluated and weighed before a complete code can be successful.

Torts. A tort has been defined as "a wrong independent of contract." It may be said that

the law of torts embraces the liability of individuals for the invasion of the rights of others when this liability is not based upon a contract. It includes the invasion of noncontractual rights of person and property whether the transgression is willful or negligent. One of the marks identifying a common-law tort has heretofore been the proof of some fault on the part of the defendant. A tortious wrong connoted a wrongdoer. Assuming no personal culpability, no willful or negligent action or inaction, the common-law rule was that there could be no liability without fault. If the damage was purely accidental, the maxim *damnum absque injuria* applied.

Exceptions are being engrafted upon the cardinal principle of no liability without fault. It is no longer true that liability presupposes a wrongdoer. Laws frequently impose absolute duties which eliminate the necessity of proving fault as an ingredient. A typical example is workmen's compensation legislation, now generally operative in the United States, which fixes liability on the employer for injuries to his employees incurred in the course of their employment. The absence of due care of the employee or the absence of negligence on the part of the employer are of no consequence. The employer is an insurer and must reimburse the injured employee. Apart from statutes, many American courts have broken down the common-law rule by holding that a person may be liable for damages due to his keeping instrumentalities which are inherently dangerous if they escape. If these agencies actually cause damage, liability follows without any proof of concurrent fault on the owner's part. Other courts stubbornly resist the expansion of the principle of liability without fault and assert that it is hostile to the course of the common law.

The pragmatic school of jurisprudence, arguing for a sociological interpretation of law, disputes the contention that liability should be premised on fault. It is said that the correct approach to the question of legal liability should be the balancing of the whole circle of conflicting social interests and the recognition of the predominant claims of society. If social progress and economic interests will be advanced by the enlargement of individual responsibility, there is no barrier against the consequent liability. The elevation of social interests, prominent in the tenets of modern legal philosophy, is a reaction against the rigid individualism of the nineteenth century. It has a proper place in the formulation of rules of legal liability. But it is possible that in our zeal to promote the general welfare we may unduly submerge the individual welfare. Excessive paternalism is just as dangerous as excessive individualism. In the judgment of many we are rapidly approaching the danger point of unwise and futile attempts to correct human failings by the compulsion of law. So also it may be suggested that the complete abandonment of the common-law principle of no liability without fault is fraught with potential harm.

It is generally stated that there is liability when there is fault accompanied by actual damage: but this proposition is sometimes debatable. A lively controversy exists regarding the right to recover damages for mental fright due to the negligent conduct of another when no di-

rect physical impact is present. Some courts contest the existence of any right to recover damages owing to the difficulty of tracing the damage and the dangers of malingering and falsification. If this practical objection can be removed, it is arguable that the form of the damage should not be an obstacle to legal redress. Medical science is progressing to the point where it is possible to distinguish between real and feigned nervous disorders. The result is noticeable in the gradual enlargement of cases allowing recovery for fright negligently or willfully caused by the defendant's conduct. A somewhat similar question arises when an unborn child is alleged to have been injured by the negligence of the defendant before birth. Has the unborn child a right to sue for damages? The almost unanimous view of the courts is that no recovery will be allowed. The practical objection is that it is impossible to prove the source of the injuries. It is also said that the unborn child is not a legal entity at the time of the injury. But this treatment of the child yet unborn as beyond the pale of legal rights has been subject to established exceptions in the criminal law and the law of property. If the cause of the damage is certain and can be traced to the willful or negligent acts of another, it is somewhat artificial to find the law protecting the property rights of an unborn child, punishing criminally prenatal killing of the child, and denying a civil remedy to the child after birth.

Property. The initiative and enterprise of man are dependent upon the recognition of his right to the fruits of his labor, the privilege of acquiring property from his accumulations and the guarantee that the State will protect his goods from unlawful aggression. Hence property law has its proper place in the legal order. In the development of the law of property, changes are less frequent than in other branches. There is manifest an emphasis upon certainty and rigidity in the rules governing the acquisition, enjoyment and transfer of property. This stability is necessary in order that the legal consequences of action concerning property may be definitely determinable.

But even the law of property is not wholly free from the force of external changes in the march of events. No longer can we say with Blackstone that the rights of private property cannot be invaded even for the general good of the whole community. Property is losing its individualistic coloring and is gradually becoming socialized. This does not portend the overthrow of private property, but it indicates rather the realization that the ownership of property is a trusteeship in which society has a latent interest. The owner of property is subject to the control by the State in the acquisition, use and disposition. Charitable corporations are frequently restricted as to the quantity of land which they may acquire; the use of land is dependent upon the effects of such user upon the public; and the disposition of property is subject to stringent rules against entangling provisions which tend to suspend its transferability. The "dead-hand" influence is reprobated by statutes which prohibit stipulations preventing alienation. These limitations are of ancient lineage, but their principle is visible in more recent extensions of the same fundamental principle.

The shortage of homes, incident to the War,

resulted in the passage of emergency rent legislation which took from the owners the right to fix the rental value of their properties and transferred this property right to administrative boards with power to adjust controversies between landlords and tenants. This power, operating to diminish materially the rights of ownership, was upheld as necessary in view of the public need. But it was plainly limited to the present emergency and the Supreme Court of the United States refused to continue its provisions in the absence of proof that the emergency still existed in the District of Columbia.

An event which is not without considerable interest in the development of the law of property in America is the comprehensive and fundamental codification of the English Property Law of 1922. This law aims at simplification and clarification of property rights, reduces materially the number and complexities of common-law estates and renders obsolete a great part of the classic rules of property. It is symptomatic of the general recognition that the law has lagged behind the progress of society and requires a thorough overhauling to bring it down to date. The success of the English experiment will be followed with interest in the United States and will probably arouse American jurists to initiate similar reforms.

Law Reform. The progress of law is indicated not only by the course of decisions and legislation but also by the movements to reform the law which are visible in society. A study of law reform serves two purposes: it portrays current shortcomings in the administration of law, and it discloses the tangible form of the proposed remedies. Four major tendencies or agencies which are destined to shape juristic development are prominent at the present time: (1) the American Law Institute, (2) uniform State legislation, (3) reformation in legal education, and (4) law enforcement.

The American Law Institute. One of the most widely held criticisms of the law is its present uncertainty and confusion of principles which impede the orderly and exact application of law. It is often difficult for lawyers to predict the outcome of lawsuits owing to the multiplication of diverse and overlapping rules and the inconsistent principles in different States, and sometimes even in the same State. Useless litigation is frequently the result of this confusion, or the compromise of valid claims. The remedy is to simplify and to clear away the accumulated mass of contradictory precedents; to make a new start by building up a body of legal formulas that will restore the power of predictability. The proposal is theoretically sound, but its practical accomplishment offers many difficulties.

The American Law Institute was formed to face these problems and to attempt their solution. The object of the Institute is: "To promote the clarification and simplification of the law and its better adaptation to social needs, to secure the better administration of justice, and to encourage and carry on scholarly and scientific legal work." Its members include the leading judges, lawyers and law teachers of America, and in addition an active corps of specialists who are assigned particular topics of the law for intensive study. The perplexities of the task of restating the law in clearer form are frankly admitted by the members of the Institute. But the need of the restatement

has inspired the organization to make every effort to insure the success of the work. The Institute was formally organized at a meeting held in Washington, Feb. 23, 1923. Many years must elapse before the concrete results of this important reform can be definitely determined.

Uniform State Legislation. The work of the National Conference on Uniform State Law deserves special mention in the consideration of legal reforms. This conference, comprising delegates from all the States, meets annually for the purpose of promoting uniformity in State laws. This is accomplished by the drafting, after careful study and analysis, of uniform statutes covering particular parts of the law. The acceptance of the drafts and their enactment by the State legislatures is purely voluntary, but the response, particularly in the field of commercial law, has been gratifying. Since these uniform acts contain many simplifications in the common-law and statutory principles, they have exercised considerable influence in ameliorating and unifying American law.

Reformation in Legal Education. Law schools, as the training centres of future lawyers, wield a potent influence upon the moral and intellectual calibre of the bench and bar. To an appreciable degree the standards of the lawyer and judge are formulated during their law-school course. Agitation for the elevation of the scholastic requirements in the law schools is a result of this close relation between legal education and legal practice. The American Bar Association has recommended that the study of law should be preceded by at least two years of college work. The proposal aroused some opposition on the ground that it would result in closing the doors of the law school to ambitious students; but the majority of the profession accepted the validity of the recommendation and the law schools, with few exceptions, are requiring this additional period of study.

Law Enforcement. It cannot be doubted that disregard of law and disobedience to law have greatly increased in recent times. This unfortunate situation is still increasing, if we may judge by statistical proof and careful surveys of the times. In an attempt to determine the causes and to find a remedy, the American Bar Association appointed a Special Committee on Law Enforcement. This committee sent out a country-wide questionnaire to prominent members of the bar and bench. The collated answers point to many causes for this breakdown of law enforcement: the demoralizing influence of war, the passage of legislation which the State is unable to enforce, the spread of irreligion, the disintegration of family life, the political influence in the administration of justice and the tardiness and technicalities of legal processes.

These multiple and varied influences complicate the task of law enforcement. Indeed, it may be safely stated that one of the primary difficulties is that the law has gradually been burdened with duties which properly should be, and in the past have been, borne by other agencies of social control. There are limitations on the efficacy of law as a means of rectifying and leveling the inequalities and hardships of societal existence. The home, school and church have their respective parts to perform in upholding the respect for authority and obedience to law. If the home is invaded with the evils of divorce, if the school fails to implant moral

principles in the youth, if the influence of the church is weakened by internal dissension, it is futile to transfer to the State the obligation of social reformation.

There are, however, regions where the law has failed to do its part. In the province of criminal law we are in need of a general simplification of procedure and substantive law. The law's delay is a potent factor in bringing about the present distrust of law. Time is of the essence in criminal and civil actions. A delay in the establishment of rights or the punishment of crimes is often as fatal as their nullification or destruction. The English practice combines speed and certainty in the detection and trial of criminal offenses. Its adoption in America would result in considerable improvement in the direction of law enforcement.

The future development of law is problematical and doubtful. There is abroad the settled conviction that the law is approaching a critical stage which necessitates a thorough reorganization. It is a hopeful augury that the legal profession recognizes the current shortcomings in the legal order and is offering concrete proposals to simplify and to clarify juridical principles. But the cooperation and support of the people are needed to restore and sustain the orderly progress of law. The sanctity and primacy of law rest upon the willing acquiescence and submission of the people, their spirit of obedience to lawful authority, no less than upon the successful installation of the stated devices of law reform. The problem for the future is not merely one of legal reformation; it also includes the preliminary and important task of social, domestic, industrial and political purification. In these larger spheres the law can assist, but it alone cannot cure the failings of humankind.

LAWRENCE, D. H. (1886-). An English novelist, born at Eastwood, on the borderline between Nottingham and Derbyshire. Due partly to his own precociousness and partly to his mother's determination, he was able to attend the Nottingham High School, and when 16 years old became a teacher. He later matriculated at the Nottingham Day Training College, and taught in London. Mr. Lawrence's works, all of them illustrations of a profound study of the reactions of human nature, possess originality and the earmarks of a literary genius. His publications, too numerous to be all mentioned here, include: *Love Poems and Others* (1913); *Tortoises* (1921), a creative animal study; *The Widowing of Mrs. Holroyd* (1914), and *Touch and Go* (1920), plays; *Twilight in Italy* (1916); *Sea and Sardinia* (1921); *Psychoanalysis and the Unconscious* (1921); *The Fantasia of the Unconscious* (1924); also the novels, *The White Peacock* (1911); *Sons and Lovers* (1913); *Women in Love* (1920); *Aaron's Rod* (1922).

LAWRENCE COLLEGE. An institution comprising a college of liberal arts and a conservatory of music, at Appleton, Wis., founded in 1846. The student enrollment increased during the decade 1914-24 from 439 to 873 in the College, and from 175 to 510 in the Conservatory of Music, and the faculty was increased from 47 to 69 members. The endowment increased also from \$905,423 to \$1,710,000, the value of the plant from \$490,110 to \$1,193,173, and the total income from \$134,527 to \$378,537. The library, in 1923-24, contained 42,892

volumes. During the 10 years, a chapel with seating capacity of 1600, a dormitory for women costing about \$160,000, and a heating plant were built by the college, and the campus was enlarged by the purchase of adjacent property. Chairs were established in politics, sociology, and religious education, a department of commerce with two full-time and one part-time teacher was founded, and a chair of Spanish added to the faculty. President, Samuel Plantz.

LAWRIE, LEE OSKAR (1877-). A sculptor born in Rixdorf, Germany. He was brought to America in infancy and was educated at the public schools and Yale University and studied sculpture under St. Gaudens and Martiny. He is a member of the National Society of Sculptors and in 1921 was awarded a gold medal by the American Institute of Architects. His work includes the sculptural decorations in the United States Military Academy at West Point, reliefs and statues for many churches throughout the country, including the Church of Saint Vincent Ferrer, for the large reredos of St. Thomas' Church, New York, and the Harkness Memorial Tower and Archway, Yale University.

LAZZARI, SILVIO (1858-). A French composer, born at Bozen, Switzerland. Abandoning the study of law, he studied at the Paris Conservatoire under Franck and Guiraud. In 1885-94, he wrote for various French journals advocating the cause of Wagner. He later lived in Paris, devoting his entire time to composition. On the occasion of the world premiere of his *Le Sauteriot* (Chicago, 1918) he visited the United States. His other works include: the operas *Armor* (Prague, 1898) and *La Lépreuse* (Paris, 1912); a pantomime, *Lulu*; a ballet, *Melanis* (Paris, 1923); a symphonic poem, *Effet de nuit*; an orchestral suite, *Impressions*; a *Konzertstück* for piano and orchestra; a string quartet, an octet for woodwind and a violin sonata; piano pieces; choruses, and songs.

LEA, FANNIE HEASLIP. See AGEE, FANNIE HEASLIP LEA.

LEACOCK, STEPHEN BUTLER (1869-). A Canadian writer and educator (see VOL. XIII). His later works include: *Arcadian Adventures with the Idle Rich* (1914); *Moonbeams from the Larger Lunacy* (1915); *Essays and Literary Studies* (1916); *Further Foolishness* (1916); *Frenzied Fiction* (1917); *The Hollenzollern in America* (1919); *The Unsolved Riddle of Social Justice* (1920); *Winsome Winnie* (1920); *My Discovery of England* (1922); *Over the Footlights* (1923); *College Days* (1923).

LEAD. In the decade 1914-24, there were many changes and developments in the lead industry, which embraces the mining of the ore and its smelting and refining. The industry was called upon during the War to supply lead for munitions, but the uses of this metal in times of peace were far more important, and were constantly growing with the ordinary development of industry. In the order of importance in 1924, one might rank the industrial uses of lead as pigments, storage batteries, lead sheets, cables and plumbing supplies, though of course other uses, such as printing type, could be readily suggested.

Lead is produced in many countries of the world (see Table), but the principal sources of supply are the United States, Mexico, Australia,

Spain and Germany, and of these the United States easily leads. In the United States, Missouri, Idaho, Oklahoma and Utah were the leading sources of production in 1924. Missouri supplied the soft lead ores which are comparatively free from silver, while the lead-silver-zinc ores come from Idaho. Oklahoma also supplies soft ores.

The production of red lead was a decreased production from the maximum of 1920, when the amount of red lead produced was 34,431 short tons, valued at \$7,523,089. In 1920, however, there were produced 62,329 short tons of litharge, valued at \$12,386,185. This year also witnessed the maximum imports of lead, which totaled 197,029,527 pounds. The maximum for

WORLD'S SMELTER PRODUCTION OF LEAD, 1913 AND 1917-1922 *

[In metric tons, by countries where smelted, but not necessarily refined. Figures in black-faced type are official.]

PRODUCTION OF REFINED PRIMARY LEAD IN THE UNITED STATES

	1918	1919	1920	1921	1922	1923
	(Short tons)	(Short tons)	(Short tons)	(Short tons)	(Short tons)	(Short tons)
Domestic desilverized lead	282,024	208,701	220,827	187,962	185,191	304,595
Domestic soft lead	210,463	147,744	189,854	157,513	209,250	190,749
Domestic desilverized soft lead	47,418	67,938	66,668	52,747	74,305	61,364
Total	539,905	424,433	476,849	398,222	468,746	556,708
Foreign desilverized lead	100,290	57,787	52,808	50,367	63,916	61,300
Total refined primary lead	640,195	482,220	529,657	448,589	532,662	618,008
Antimonial lead	18,579	13,874	12,535	10,064	8,075	14,190

In 1913, the United States produced 462,460 short tons of primary lead from domestic and foreign ores; in 1923, there was refined 629,073 short tons of primary lead, and of this amount Missouri was responsible for 169,350 short tons, or nearly 30 per cent of the total; followed by Idaho with 134,036 short tons, and Utah with 107,949 short tons. In the smelting and refining industry, the summary from the Bureau of the Census indicates the condition of the industry in the years 1914, 1919 and 1921, when the Census of Manufactures was taken.

white lead was 194,991 tons in 1922, valued at \$35,513,395.

The Pittman Act, which put a price on silver produced in the United States, until its expiration in 1923, naturally stimulated the production of lead where this metal was an important by-product.

In 1923, the United States imported a total of lead valued at \$14,613,071, distributed as follows: ore and matte, 66,882,850 pounds, valued at \$3,170,190; bullion or base bullion, 161,496,495 pounds, valued at \$8,532,423; pigs, bars

LEAD SMELTING AND REFINING INDUSTRY (Value in thousands of dollars)

Year	Number of establishments	Persons engaged	Salaries and wages	Cost of materials	Value added by manufacture	Total value of product
1914	22	8,036	\$7,629	\$154,014	\$17,564	\$171,578
1919	25	7,354	11,281	179,373	17,421	196,794
1921	23	5,088	7,264	134,061	16,582	150,593

and other forms, and old lead, 42,198,848 pounds valued at \$2,384,191; manufactures of lead, excepting type metal, 400,418 pounds, valued at \$94,657; type metal, 7,353,463 pounds, valued at \$431,610.

LEAGUE OF NATIONS. The greatest constructive achievement of the Peace Conference at Paris was the organization and establishment of a definite agency of international co-operation designed to further concerted action both in the preservation of the future peace of the world and in the promotion of general human welfare—the League of Nations. For the origins of this significant institution, one is obliged to seek far beyond the council chambers of Paris.

During recent centuries, irresistible material forces greatly intensified by the never-ending Industrial Revolution, had broken down the last barriers of local isolation and self-sufficiency, created a world market for capital, raw materials, finished products and labor, and, by rendering all regions and all nations increasingly interdependent, had laid broad and deep the economic foundations for the possible erection of a political superstructure of internationalism. The cultural interdependence of nations was no less marked. Despite distinctive languages and national folkways, the peoples of the world had gradually developed a genuine community of intellectual and æsthetic interests strikingly revealed in periodical world conventions of distinguished physicists, chemists, biologists, historians and economists. Religious, democratic, trade-union, socialist and feminist movements were international in scope and influence. Everywhere there was a more than perceptible tendency to adopt uniform standards of clothing, food and architecture, as well as of literature, science, and politics. "Thirty nations formed the Universal Telegraph Union (1875); 23 adopted a convention regarding the common use of the metric system of weights and measures (1875); 60 adhered to the Universal Postal Union formed in 1878 with headquarters at Bern, Switzerland; five joined the Latin Monetary Union (1865); 20 ratified the Bern Convention of 1883 for the standardization of patent laws; and 12 signed the Bern Convention of 1887 providing for practically uniform copyright laws." Not unnaturally, under these circumstances, there arose in the various countries a host of pacifists who denounced war as a relic of barbarism, unmoral, un-Christian, and inimical to modern cultural progress, to normal economic intercourse and to sound political development. Peace societies first organized in England (1816), the United States (1828), Italy (1828), and France (1841), multiplied rapidly after 1878, until by 1914 there were about 160 with numerous branches and large membership. "International Peace Congresses, assembling intermittently and spasmodically between 1843 and 1889 became regular annual events after the latter date, and in 1891 permanent headquarters of the international peace movement were established at Bern." To optimistically minded pacifists, the First and Second Hague Peace Conferences (1899, 1907) seemed extremely auspicious—"the real beginning of an organized international state, with its capital in The Hague, with its regular congresses, with its statutes and codes, with its permanent court of arbitration." They failed to perceive the essential anarchy and increasing

tension of international relations, the ominous forces of nationalism, imperialism, militarism, secret diplomacy and systems of alliances potentially operating to disrupt the state-system and to produce the most stupendous catastrophe in all history—the great war of 1914-18. The precipitation of this vast conflict was a shock and a disillusionment, but to hundreds of thousands in the Allied countries, the protracted struggle gradually took on the aspects of a great and disinterested crusade for eternal peace and righteousness. It became "the war to end war."

Statesmen in all Allied countries gave voice to idealistic pronouncements regarding war aims. Premier Asquith spoke of a "real European partnership" and the passing years saw increasing cooperation on the part of the Entente governments. Of particular importance was the series of lofty addresses delivered by President Woodrow Wilson of the United States during the years 1916, 1917, and 1918. On May 27, 1916, speaking before the American League to Enforce Peace, he laid down three general principles which prefigured his international aims during subsequent years: (1) every people has a right to choose the sovereignty under which it shall live; (2) the small states of the world have a right to enjoy the same respect for their sovereignty and for their territorial integrity that great and powerful nations expect and insist upon; and (3) the world has a right to be free from every disturbance of its peace that has its origin in aggression and disregard of the rights of peoples and nations. Here was Wilson's fundamental programme enunciated a year before America entered the War; his subsequent addresses represented merely the elaboration and refinement of details. Speaking before the Senate on Jan. 22, 1917, he demanded the replacement of the old system of alliances by a general concert of powers. His war message of Apr. 2, 1917, emphasized American determination to fight for a "universal dominion of right by such a concert of free peoples" as should bring peace and safety to all nations. Finally, the project for a league was incorporated in his address of Jan. 8, 1918, as the Fourteenth Point, viz., "A general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike." At the time of the Armistice this stipulation, among others, was accepted by Germany and by the Entente Powers as the basis of the future peace settlement. Wilson resolved to attend the Paris Conference in person to make sure that his project would be realized.

Organizations such as the American League to Enforce Peace and the British League of Nations Association had long been engaged in drawing up plans for keeping the peace. Men like ex-President Taft, Elihu Root, Lord Robert Cecil and Lord Bryce had given the matter careful study, examining with a fresh interest the famous schemes propounded in previous centuries by Pierre du Bois, St. Thomas Aquinas, Marsiglio of Padua, King Henri IV, the Quaker William Penn, the Abbé St. Pierre, the philosopher Immanuel Kant, Czar Alexander I, and others. A league was made part of the war-aims of the Inter-Allied Labor and Socialist Conference of February, 1918. In the spring of 1918, a committee of international lawyers

headed by Lord Phillimore, which had been appointed by the British government to study the subject, made a report formulating in legal, diplomatic phraseology what was deemed to be the practical substance of the multifarious suggestions already before the world. The report favored a guarantee of peace through compulsory arbitration or conciliation, as did the American League to Enforce Peace, but its scheme of organization for the proposed league lacked definiteness. Copies of this report being sent to the British War Cabinet, to the Dominion prime ministers, and to the President of the United States, gave rise to numerous revised drafts. During the early summer of 1918, President Wilson's confidential adviser, Col. E. M. House, rather elaborately revamped the British committee's report, providing a permanent secretariat and a court of international justice, but eliminating the sanction of military force. After considering House's plan, Wilson prepared his own first draft, conspicuously omitting the court and restoring the sanction of physical force. This draft he took with him to Paris where in addition to receiving certain suggestions from his Secretary of State, Mr. Lansing, who championed the theoretical equality of all states and favored legalistic methods of settling international disputes, he was confronted with two new projects, both British, both based in large degree upon the Phillimore report, but each with characteristic features of its own—one by General Smuts of South Africa and the other by Lord Robert Cecil. Profoundly impressed by Smuts's plan, Wilson utilized it in revising his own, taking over a whole new scheme of organization establishing a smaller executive council in addition to the general conference and secretariat proposed by previous plans, more definite ideas concerning limitation of armament, arbitration and its guarantees, and also a mandatory system for the supervision and control of conquered territory. The Inter-Allied Labor and Socialist programme of 1918 had looked forward to the international administration of all colonial empires, but Smuts, to whose mind the mandatory concept had thus been suggested, limited its scope to territories dismembered from the Russian, Habsburg, and Ottoman Empires. Wilson, attracted to the central idea which had such deep roots in historic American policy (e.g. Cuba, etc.), advocated its application to the former German colonies. Cecil's plan, which proposed domination of League activities by an executive council composed exclusively of the Great Powers, did not so much influence the President, but powerful currents of world opinion represented by the labor movement and Jewish propaganda caused Wilson to insert in his second draft provisions according more recognition to the interests of labor in the determination of world affairs and requiring all new states to grant equal rights to their "racial or national minorities." In compliance with Wilson's request, this second draft as printed and circulated on Jan. 10, 1919, brought forth a number of comments and criticisms, some of which (e.g. those submitted by General Bliss and David Hunter Miller) impelled him to prepare a new revised draft. Certain vital differences between this third Wilsonian draft and an official plan transmitted to him from the British delegation (January 19) led to the collation of the two into a composite plan by the legal advisers of the two

delegations. This so-called Hurst-Miller draft, though wholly satisfactory to neither side, provided a broad basis of agreement between them.

"Practically nothing—not a single idea in the Covenant of the League was original with the President. His relation to it was mainly that of editor or compiler, selecting or rejecting, recasting or combining the projects that came in to him from other sources. He had two great basic convictions: that a League of Nations was necessary; that it must be brought into immediate existence. . . ." In December, 1918, Premier Clemenceau of France had openly expressed his desire to retain the old system of alliances; at the same time, Winston Churchill, of the British cabinet, mouthpiece of reactionary militarism, had declared that the League was no substitute for British sea power. At Paris, the European Allies and Japan wanted the territorial, military, and economic settlements made first and in accordance with the provisions of the old secret treaties, before any attempt should be made to establish a league. The French, in listing the subjects to be considered by the Conference, placed the League last. Wilson, however, placed it first and insisted with determination that a League of Nations should be made "an integral part of the general treaty of peace." A resolution to that effect, passed by the Council of Ten on January 22, was accepted by the second plenary session three days later and a commission was appointed, composed of two representatives from each of the five great powers (United States, Great Britain, France, Italy, and Japan) and one from each of five, later nine, small powers. President Wilson became chairman of this commission, the membership of which, as ultimately constituted, embraced such leaders as Premier Orlando of Italy, Baron Makino of Japan, Cecil and Smuts of the British Empire, House of the United States, Bourgeois and Larnaude of France, Venizelos of Greece and Wellington Koo of China. Using the Hurst-Miller compromise plan as a basis of discussion, in preference to drafts submitted by the French and Italians respectively, the commission held 10 meetings, February 3-13. The French desperately endeavored to convert the projected league into a buttress of French security by advocating an international army directed by an international general staff which should execute the decisions of the League and supervise all military affairs including reduction of armaments. The Italians vehemently opposed any attempt to incorporate a provision for the abolition of conscription. The Japanese, supported in this sole instance by the Chinese, insisted upon explicit recognition of the principle of racial equality. Both the French and Japanese suggestions were rejected, however, the most important single alteration being the reinsertion of an article calling for the establishment of a Permanent Court of International Justice. A complete tentative draft of the Covenant was submitted to the second plenary session of the Conference February 14, and adopted unanimously. Meanwhile a keen struggle in the Council of Ten (January 23-30) had resulted in the reluctant acceptance of a resolution providing for the application of League mandates to the administration of former German colonies rather than cessions in absolute sovereignty as demanded by the British, the French, the Italians and the Japanese.

The struggle over the League was by no means at an end. Wilson's visit to America in late February and early March acquainted him with Senatorial opposition to the Covenant, and after consulting with his Democratic advisers and certain leading pro-League Republicans including Taft, Root and Lowell, he returned to Paris determined to secure three amendments designed to cover American criticism. They included: (1) specific recognition of the Monroe Doctrine; (2) provision for voluntary withdrawal of any state (e.g. America) from the League upon stipulated notice; and (3) specific exclusion of domestic questions from purview of League activity. Arriving at Paris, March 14, Wilson quickly repudiated the attempt which had been made during his absence to impose preliminary general peace terms upon the enemy without immediately establishing the League. His desire to have the Covenant amended reopened the former struggle with the French and Japanese over their respective plans for an international military organization and recognition of racial equality. Even the British keenly opposed specific recognition of the Monroe Doctrine but they were eventually won over and, through a personal understanding with Clemenceau over the other French claims before the Conference, Wilson secured sufficient backing to have his amendments adopted and French and Japanese proposals rejected. After five night sessions held from March 22 to April 11 during the most critical period of the Conference, revision of the Covenant was finally completed by the Commission, and on April 28 it was accepted by the fourth plenary session for subsequent incorporation as the first section in each of the major treaties of peace.

The Covenant of the League of Nations as thus framed was a comparatively brief document setting forth in 26 articles the rights, obligations, and privileges of the member states. The 32 Allied and Associated Powers convened at Paris (see *PEACE CONFERENCE AND TREATIES*), of whom the United States, Ecuador, and Hedjaz alone subsequently refused to join, were designated as original members, and 13 neutral states, viz. Argentina, Chile, Colombia, Denmark, the Netherlands, Norway, Paraguay, Persia, Salvador, Spain, Sweden, Switzerland, and Venezuela, were invited immediately to accede to the Covenant. The desire of the British and Americans forthwith to admit the enemy powers was frustrated by the opposition of France and Belgium. Certain other states—notably Russia and Mexico—whose governments had not been formally recognized by the Powers generally were also temporarily excluded. Provision was made for the admission of any fully self-governing state, dominion or colony as a new member by a two-thirds vote of the General Assembly of the League, and for the withdrawal from the League of any member on two years' notice, "provided that all its international obligations and all its obligations under this Covenant shall have been fulfilled." In accordance with the former provision, Austria and Bulgaria as well as Finland, Luxemburg, Costa Rica and Albania were admitted to membership in December, 1920; Esthonia, Latvia, and Lithuania in September, 1921; Hungary in September, 1922; and Abyssinia and the Irish Free State in 1923. The nine principal sovereign states still outside the League in June, 1924, were Afghanistan, Ecuador, Egypt, Germany,

Mexico, Russia, Santo Domingo, Turkey and the United States.

Three organs of administration and control and one judicial organ were to be established; namely, an Assembly, a Council, a Permanent Secretariat and a Permanent Court of International Justice. The Assembly was to meet at stated intervals at the seat of the League and was empowered to deal with any matter within the purview of the Covenant, each member state, including the British Dominions, being entitled to only one vote in its meetings though privileged to send at most three representatives. The Council was to consist of representatives of nine states comprising, first, five permanent members—the United States, the British Empire, France, Italy, and Japan—and secondly, four others to be selected or superseded by the Assembly "from time to time at its discretion," the first nonpermanent members being provisionally designated by the Covenant as Belgium, Brazil, Spain, and Greece. Each state represented on the Council was to have only one delegate and only one vote. Additions to either of the two classes of members—permanent and nonpermanent—might be made by the Council if such action secured the approval of the Assembly, and it was also stipulated that any member of the League might be represented at meetings of the Council whenever any matter specifically affecting its interest should come up for consideration. Parties to disputes were to have no vote, however, and decisions by the Council normally had to be unanimous. The Permanent Secretariat, comprising a Secretary General and such secretaries and staff as might be required, was to be established at Geneva, the first seat of the League.

The purposes of the League as set forth in the preamble to the Covenant were "to promote international coöperation, and to achieve international peace and security." The Covenant embodied pointed endeavors to mitigate or eliminate the general forces alluded to above as operating to cause wars in the state system, namely nationalism, militarism, imperialism, secret diplomacy and systems of alliances, and also to provide agencies for the settlement of specific disputes between nations. To this end the signatory powers pledged themselves (Article X) "to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League." The members of the League recognized that the maintenance of peace required the "reduction of national armaments to the lowest point consistent with national safety and the enforcement by common action of international obligations." To the Council was intrusted the important function of formulating decennial plans for the reduction of armaments, which having once been accepted by the particular governments concerned were not to be changed without the consent of the Council. The Council was also empowered to suggest means for preventing the evils attendant upon the manufacture by private enterprise of munitions and implements of war. Members of the League undertook to interchange full and frank information as to the scale of their armaments and their military, naval and aeronautical programmes.

Any war or threat of war, whether directly affecting any member or not, was declared to be a matter of concern to the whole League,

and at the request of any member, a meeting of the Council should be summoned forthwith. Each member possessed the friendly right of calling the attention of the Assembly or of the Council to any circumstance threatening international peace or good understanding. Members of the League were pledged to submit all potentially dangerous disputes, which could not be satisfactorily settled by diplomacy, either to arbitration or to inquiry by the Council and in no case to resort to war until three months after the award of the arbitrator or the report of the Council. The Permanent Court of International Justice, for whose establishment provision was made, was to be endowed with power to determine any international dispute submitted to it by the contestants and also to give an advisory opinion on any matter referred to it by the Council or by the Assembly. Dangerous disputes not settled by diplomacy, or submitted to arbitration, were to be referred to the Council or through it to the Assembly, and if all efforts at conciliation failed, the facts and recommendations were to be published. Members obligated themselves not to go to war with the party to the dispute which accepted the suggestion of the conciliating agency, but any member resorting to war in violation of its covenants was *ipso facto* to be deemed to have committed an act of war against all other members, who bound themselves immediately to sever all commercial, financial and personal relations with the nationals of the covenant-breaking state and to prevent any intercourse between that state and any other state whether a member of the League or not. The Council was invested with the duty of recommending what effective contribution each member of the League should contribute to the armed forces to be used to protect the covenants of the League. In the event of a dispute between a member of the League and an outside state, or between two or more nonmember states, the League was to offer its services; and if the invitation should be rejected and a member of the League attacked, all other members were to come to its aid.

The Covenant expressly affirmed the validity of international engagements, such as treaties of arbitration or regional understandings like the Monroe Doctrine, for securing the maintenance of peace, but all other obligations or understandings inconsistent with the terms of the Covenant were to be abrogated, the Assembly being empowered to advise the reconsideration of treaties which had become inapplicable. A blow was dealt to secret diplomacy by the requirement that henceforth every new treaty or international engagement should be forthwith registered with the Secretariat and published by it; and no such pact was to be considered binding until so registered.

As territorial greed and colonial rivalries had been prolific causes of war in the past, the Covenant provided a new system for controlling the German colonies and dismembered portions of the Turkish Empire which were not to be divided among the victors as spoils but administered as sacred trusts of civilization for the benefit of the peoples concerned. The various areas were to be intrusted to various members of the League under mandates prescribing the degree and kind of authority that they might exercise, guaranteeing certain rights to the natives and requiring annual reports from the

mandatories. In other ways the League was inextricably interwoven with the general peace settlement. To it were intrusted the administration of international areas, such as the Saar Basin (q.v.) and the Free City of Danzig (q.v.) and the conduct of certain plebiscites such as those in North Schleswig, Allenstein and Marienwerder, and Upper Silesia (qq.v.).

Members of the League pledged themselves to coöperate in the reciprocal establishment of freedom of transit and equitable treatment for commerce in the improvement of labor conditions, the international prevention of disease and mitigation of suffering, the suppression of the arms traffic, the traffic in women and children, and in opium and other dangerous drugs. To the League were to be transferred all international bureaus and commissions. Provision was made for the amendment of the Covenant at any time by a unanimous vote of the Council and by a majority of the Assembly, though the somewhat faulty drafting of the Covenant was manifested by omission of any reference to ratifications.

The League of Nations formally came into existence on Jan. 10, 1920, with the exchange of ratifications of the Treaty of Versailles. During the years 1920-24 League activities developed along three main lines: (1) establishment and operation of its organs of administration and control; (2) the promotion of general international welfare; and (3) the partial elimination of general causes of war and the attempted solution of certain specific disputes arising between nations.

First convened on Jan. 16, 1920, the Council, up to June, 1924, held 28 sessions in various places. Official rules of procedure were early adopted and the Council rapidly demonstrated itself to be a flexible organ of action well adapted to the requirements of a constantly changing situation. The passing years witnessed a notable expansion of its agenda from three items at the first session to about 75 in 1924. In 1922, with the subsequent approval of the Assembly, the Council increased its nonpermanent membership from four states to six, the permanent members, due in part to the continued abstention of the United States, being thus outnumbered six to four. It became the practice of the Assembly to elect its representatives to the Council annually, though the same state might be reelected indefinitely. Greece was on while Venizelos was in power; Sweden's election (1922) indicated that Premier Branting represented a widely held point of view; China, designated in 1920, was dropped when Wellington Koo returned to Peking; and Czecho-Slovakia was added (1923) because Eduard Benes exercised influence and commanded confidence outside of his own country. The states elected at the fourth annual meeting of the Assembly (September, 1923) were Belgium, Brazil, Czecho-Slovakia, Spain, Sweden and Uruguay. In September, 1923, the Council decided that henceforth regular sessions would be held quarterly, in March, June, September, and December.

The Assembly first met during November and December, 1920, at which time it was decided that future sessions should be held annually in September. Though not possessing the flexibility and initiative of the Council, the Assembly came to occupy a place of considerable importance in the League. Its membership has

embraced men of experience in public affairs, often endowed with keen powers of criticism and in some cases real constructive ability—premiers, foreign ministers, members of parliaments and diplomatic corps. By prescription in the Covenant and by practice the Assembly came to perform three duties exclusive to it, i.e. passing the annual budget, admitting new members, and electing nonpermanent members of the Council. Annual reports of the work of the Council and Secretariat submitted to the Assembly for review, criticism, and approval, elicited discussions constituting an extremely useful appraisal of international progress and a challenging conspectus of world opinion upon important questions.

By an annex to the Covenant, Sir Eric Drummond, of Great Britain, was named first Secretary General and during the next four years an elaborate but highly efficient and flexible Secretariat was developed under his direction. The Secretariat was charged with the task not only of preparing the work and executing the decisions of the Council and Assembly, but also of placing at their disposal extensive, detailed, specific, and up-to-date information upon the various topics and problems confronting one or the other. An admirable organization was developed to direct the multifarious and intricate activities falling under its supervision, the Secretariat being divided into 10 technical sections and six administrative departments with a technical staff comprising about 300 experts of 30 different nationalities. Nearly 500 public and private international agencies and commissions had also been placed under the ægis of the League.

In February, 1920, an advisory commission of 12 eminent international jurists was appointed by the Council to draft a statute organizing the Permanent Court of International Justice authorized by the Covenant (Article 14). With the exception of the provision for obligatory jurisdiction and certain minor details, their report was approved by the Council during the summer of 1920 and adopted by the Assembly at its first meeting. Thirty-six nations made a futile effort to secure compulsory jurisdiction for the new court, but the Great Powers refused to engage themselves to submit all justiciable disputes thereto, although subsequently numerous smaller states signed an additional optional clause for compulsory jurisdiction, or entered into mutual agreements to that effect. "The jurisdiction of the Court," ran Article 36 of the statute creating it, "comprises all cases which the parties refer to it and all matters specially provided for in the Treaties and Conventions in force." The new court was designed to be an impartial, permanent judicial organ, capable of settling international disputes of a purely legal character without the intrusion of political considerations. It was not intended to duplicate or supersede the Court of Arbitration created by the First Hague Peace Conference (1899). The two courts continued to exist side by side, the old court having the function of "arbitrating" a difficulty, the new one the function of deciding what law applied in any given case. It was not intended, as were the Council and Assembly, to devise arrangements, adjustments, and compromises as a method of harmonizing conflicts between states, but simply to interpret, explain, and apply international laws and conventions. Following a

suggestion made by Mr Root of the United States, the statute provided for the election of judges for a term of nine years by an absolute majority in the Council and Assembly voting separately, thereby appeasing the demands of both large and small states for commensurate powers of choice. In September, 1921, 11 judges including Prof. John Bassett Moore of the United States, and four deputy judges were chosen in this way. The first regular session of the Court was opened at its permanent seat (The Hague) on June 15, 1922. During the first two years of its existence it functioned very satisfactorily, rendering nine opinions on difficult controversies submitted to its jurisdiction. Eight of these decisions were technically "advisory opinions" on contentious questions submitted by the Council of the League of Nations, viz.: (1) Whether Netherlands had complied with article 389 of the Versailles Treaty in nominating a workers' delegate to the International Labor Conference (decision affirmative); (2) Whether the competence of the International Labor Office (q.v.) extends to agricultural labor (decision, affirmative); (3) Whether the competence of the same body extends to methods of agricultural production (decision, negative); (4) Whether the British-French dispute regarding French nationality decrees in Tunis and Morocco was a domestic matter which France under Article 15 of the Covenant could refuse to arbitrate, or an international matter subject to arbitration (decision, in favor of France); (5) Whether articles 10-11 of the Treaty of Dorpat placed Russia under legal obligation to Finland regarding the autonomy of Eastern Karelia (as Russia had not accepted its jurisdiction, the Court refused to give any opinion); (6) Whether Poland had the right to oust certain German colonists (decision against Poland); (7) Whether the Minority Treaty signed by Poland entitled the League to deal with Poland's refusal of Polish nationality to certain German residents (decision, affirmative); (8) Whether the decision of the Conference of Ambassadors, July 28, 1920, settling the boundary between Poland and Czechoslovakia in the Jaworzna (Zips) district was definite and final (decision, affirmative). Of different nature was the suit for 165,749.35 francs damages brought by England, France, Italy, and Japan against Germany for refusing to allow the steamship *Wimbledon* to pass through the Kiel Canal; the decision, unfavorable to Germany, awarded the plaintiffs 25,000 francs less than they had claimed, and was of considerable significance for the future regulation of international canals in time of war.

Up to 1924, perhaps the chief service performed by the League of Nations had been the promotion of international welfare. Its humanitarian work proved varied and efficient, and by extensive technical investigations it threw much light upon unsolved social and economic problems. In restricting the traffic in opium and other dangerous drugs, in convoking an international assembly to deal with the white slave traffic and establishing an advisory committee to supervise the enforcement of the convention adopted, in creating a commission on intellectual coöperation, and perhaps most notably of all in organizing international coöperation to combat epidemics and promote medicine and sanitation, the League so well demonstrated the practicability of humanitarian international-

ism that some nonmembers gave their full cooperation and even the United States, though opposed to the League, accorded quasi-official collaboration. More important, perhaps, in general estimation, was the success of the League in the economic reconstruction of bankrupt Austria, a success followed by plans for League control of Hungarian finance. The function of eliminating the general causes of war and of settling specific disputes between nations had been less successfully fulfilled. In its endeavors to secure a reduction of armaments the League was handicapped by the intransigence of certain Great Powers, though its investigations and recommendations on the subject proved enlightening and helpful (see WASHINGTON CONFERENCE). The supervision of mandated territories (see PEACE CONFERENCE AND TREATIES) proved moderately beneficent and efficient. A controversy between Finland and Sweden over the Åland Islands (q.v.) was successfully adjusted; the intervention of the League in the Albanian question was rewarded by a considerable measure of success (see ALBANIA), as were also its services in partitioning Upper Silesia between Poland and Germany. A dispute between Poland and Lithuania over Vilna (q.v.) was less satisfactorily dealt with, though a dispute between the same two nations over the port of Memel (q.v.) was decided in March, 1924. The League was practically defied by Italy (q.v.) during the Coifu incident (August-September, 1923), and its services were not utilized in connection with the two major armed conflicts which had raged since 1919—the Russo-Polish War and the Græco-Turkish War. The explanation for the undoubted impotence of the League in these and other instances is to be sought in the fact that the Allies strove, rather unsuccessfully, to deal through the Council of Premiers rather than through the League, with questions arising from the peace settlement.

With the advent to power of new governments in Great Britain (q.v.) and France (q.v.) the outlook for the League of Nations perceptibly brightened, for the Socialist premiers, MacDonald and Herriot, announced their intention of making more extensive use of its services. Simultaneously, the widespread accordance of *de jure* recognition to Soviet Russia paving the way for eventual admission to the League, the probability that Germany might shortly be admitted, and the appearance of a strong movement in the United States favoring adhesion to the Permanent Court of International Justice and possible entrance into the League itself; all seemed to prefigure a more auspicious future for the newly devised instrument of international coöperation. See PEACE CONFERENCE AND TREATIES; LABOR ORGANIZATION, INTERNATIONAL; UNITED STATES; GERMANY; GREAT BRITAIN, etc.

LEATHER. The leather industry in the United States in the period from 1914 to 1924 underwent many vicissitudes in which the production of live stock, the demands due to the War and the general change in business and industrial conditions figured. The United States ranked first among the nations of the world in the production of leather, inasmuch as its total production of finished leather was estimated to be equal to that of all the rest of the world combined. However, the production of cattle-hides, calf-skins and sheep-skins did

not increase proportionately with the demand for leather, and American tanneries were forced to import a considerable amount of material. For example, in 1923 while there was a large production of hides, yet almost 45 per cent of the raw material entering into the manufacture of leather was imported, with the exception of goat-skins, of which 98 per cent were imported. Normally, in the United States there is a greater production of leather than the domestic markets can consume and this production must be taken care of by substantial exports, which in 1919 reached a peak value of \$218,783,300. It is apparent, therefore, that the condition of this industry is more or less connected with world conditions, and in few American industries are there such serious fluctuations as in those connected with the production of leather.

In the United States, the finished product of the tanning industry consists of whole hides, sides, backs, bends, butts and offal, or skins, and the four main groups of finished leather products divided into: (1) sole, belting, side, upper, patent, harness, back and upholstery; (2) calf and kip upper leather; (3) goat and kid upper and fancy leather; (4) sheep and lamb upper, lining and fancy leather. The tanning industry, according to the Bureau of the Census, 1921, ranked 10th among the 14 leading industries of the United States when considered from the viewpoint of the total value of the product. As already stated it is necessary for the United States to import approximately 50 per cent of the calf-skins, 30 per cent of the calf-hides, 99 per cent of the goat-skins and 63 per cent of the sheep-skins used in its tanning industry; or, in other words, fully 50 per cent of the hides and skins entering into international trade are taken by the United States, exclusive of those originating in the country.

In 1922, the American tanning industry consumed approximately 132,000 hides and skins, of which 81 per cent was used in the production of shoe leathers, 9.8 per cent in fancy book-binding and kindred leathers, 6 per cent in glove leather and 3.2 per cent in belting, bag, harness and upholstering leather. The consumption of the various hides and skins in 1922 was as follows: cattle hides, 274,000; calf- and kip-skins, 15,835,000; goat- and kid-skins, 48,814,000; sheep, lamb and cabretta, 39,886,000, and other hides and skins, 3,248,000.

The American leather production in the period from 1914 to 1922, as summarized by the Bureau of the Census, is given in the table.

COMPARATIVE TABLE OF AMERICAN
LEATHER PRODUCTION
(Figures represent thousands)

Classes	1914	1920	1921	1922
Sole leather, sides	18,075	18,392	18,062	17,700
Belting leather, butts . . .	647	1,677	1,195	991
Side upper and patent, sides	10,036	16,216	14,872	22,976
Harness leather, sides . . .	2,777	1,153	811	1,380
Bag, case, and strap, sides .	1,094	626	820	1,256
Upholstery, hides	654	327	413	720
Calf and kip, skins	16,067	10,900	14,888	15,634
Goat and kid, sides	37,775	(*)	35,058	48,814
Sheep and lamb, skins . . .	42,038	29,987	29,320	40,951

* Production figures not available for this year.

The only comment necessary in connection with this table is the statement that the production of hemlock sole leather had declined from 10,-

000,000 sides in 1904 to 70,000 sides in 1922, owing largely to the development of the tanning and shoe industries in the British Colonies and Dominions, which rendered unnecessary this leather that was formerly used chiefly in shoes for the British Colonial trade. On the other hand, there had been increased production in oak and union sole leather. From 1904, when nearly 4,400,000 sides were used in harness leather, or 12 per cent of the total sides tanned, there was a decline, so that in 1922 harness leather amounted to but 1,380,000 sides, or 3 per cent of the total sides tanned, owing obviously to the decreasing production of harness leather on account of the use of automobiles and tractors and the liquidation of war stocks. See **BOOTS AND SHOES**.

LEBANON, GREATER. See **SYRIA**.

LE BARON, WILLIAM (1893-). An American editor and playwright, born at Elgin, Ill. He studied at the University of Chicago and at New York University, and served as editor of *Collier's Weekly* and of Cosmopolitan productions. He was the author of several successful plays, including *The Very Idea*; *Her Regiment*; *Back to Earth*; *Apple Blossoms*; *Nobody's Money*; *The Scarlet Man*, and *The Love Letter*.

LE BON, GUSTAVE (1841-). A French anthropologist (see **VOL. XIII**). His most important recent works are: *La Vie des Vénérables* (1914); *Enseignements Psychologiques de la Guerre Européenne* (1915); *Premières Conséquences de la Guerre: Transformation Mentale des Peuples* (1916); *Hier et Demain: Pensées Brèves* (1918); *Psychologie de l'Éducation* (1917); *Psychologie des Temps Nouveaux* (1920).

LE CHATELIER **PRINCIPLE.** See **CHEMISTRY, PHYSICAL**.

LECOINTE, SADI (?-). A French airman who made a new altitude record in 1923 (October 30) at Issu-les-Moulineaux, France. He rose 36,555 feet in a Nieuport Delage plane *Hispano*, breaking the 1921 record made by Lt. J. A. Macready, U. S. A. To the middle of 1924, Lecoing had made 19 world's records. He was an Officer of the Legion of Honor.

LEE, JAMES MELVIN (1878-). An American editor, born at Port Crane, N. Y. He was graduated from Wesleyan University in 1900 and in 1901-02 taught at the Western Reserve Seminary in Ohio. He then entered the newspaper business and was editor of many periodicals, including *Outing*, *Leslie's Weekly*, and *Judge*. He was lecturer on journalism at the New York University in 1910-11, and in the latter year became director of the department of journalism in that university. He wrote *How to Be Self-supporting at College* (1903); *History of American Journalism* (1917); *Opportunities in the Newspaper Business* (1919).

LEEWARD ISLANDS. A group of islands in the British West Indies, constituting a colony. They comprise Antigua, Montserrat, St. Christopher and Nevis (usually called St. Kitts), a part of the Virgin group, Dominica, and their dependencies. Total area, 715 square miles; population, 122,242 in 1921 (127,193 in 1911). The leading products continued to be sugar, molasses, lime-juice, coconuts, and fruits. Imports for 1913-14, 1920 and 1921 were £588,362, £1,527,889, and £1,059,312. Exports for the same years totaled £563,963, £1,781,361, and

£970,694. Revenues and expenditures of government follow for 1921-22 (1913-14 figure in parentheses): revenue, £260,671 (£174,331); expenditure, £303,575 (£171,128); public debt, on Mar. 31, 1922, £250,850 (£244,689).

LE GALLIENNE, EVA (1899-). An actress born in London, England, the daughter of Richard Le Gallienne. She was educated in France at the Collège Sevigné and started her stage career in London at the Prince of Wales Theatre there in 1915 in *The Laughter of Fools*. The next year she went to New York and gave her first American performance in *The Melody of Youth*. Other successes included: *McLazarus* (1916-17); *Off Chance* (with Ethel Barrymore 1917-18); *Not So Long Ago* (1920-21); *Lilom* (1921-22); *The Swan* (1923).

LEGINSKA, ETHEL (real name **LEGGINS**) (1883-). An English pianist, born at Hull. After studying four years at the Hoch Conservatory in Frankfurt, she continued her studies with Leschetizky in Vienna for three years more. Her successful début in London was followed by extended tours of Europe. She made her American début in New York (January, 1913), but did not establish herself as a really great pianist until the next year, when she began to play colossal programmes, well calculated to show her transcendent technic and masculine power. Overwork brought on a nervous breakdown in 1917, obliging her to retire temporarily from the concert stage. During her convalescence she became fired with the ambition to win laurels as a composer, and for this purpose studied composition with Ernest Bloch in New York. She returned to the concert stage in 1921, but her appearances after that time were rather infrequent. Her compositions, which are decidedly futuristic, consist of songs, pieces for piano, *Four Poems* (after Tagore) for string quartet, and a symphonic poem, *Beyond the Fields We Know*.

LEGION, AMERICAN. A society of veterans of the War in Europe, organized Mar. 17, 1919, in Paris, France, by members of the Army and Marine Corps serving with the American Expeditionary Forces. On Sept. 16, 1919, it was incorporated by Act of Congress, declaring itself to be "patriotic, nonpartisan, nonpolitical, non-military, and permitting no distinction due to rank or place of service." Membership was open to any soldier, sailor, or marine who served honorably between Apr. 6, 1917, and Nov. 11, 1918, and women enlisted or commissioned in any branch of service during that period. The Legion held its first national convention at Minneapolis, Minn., Nov. 10-12, 1919. It adopted a constitution, elected Franklin D'Olier, of Philadelphia, national commander, and began its career as an established body.

It immediately entered on an aggressive campaign against political radicalism, draft evaders, slackers, and propagandists of subversive political doctrines. This activity brought it into frequent clashes with the radical element in which several Legionnaires lost their lives. For a time there was an estrangement between the Legion and several branches of organized labor, but this breach was healed. In 1920 Samuel Gompers, president of the American Federation of Labor, endorsed the Legion and urged union members to join it. In 1919 it began a campaign for a military policy based on the selective draft in time of war, with a navy

second to none and a small Regular Army in time of peace, but with an organized and completely officered peace-time reserve capable of expansion to a strength of 4,000,000 in war time. This was the basis of the Defense Act which became a law in 1920. In 1924 the Legion advocated legislation controlling prices in war time and effecting an industrial mobilization calculated to minimize profiteering. In 1922 the Legion conducted an investigation of war-time profiteering which resulted in many prosecutions and the recovery of several millions of dollars from war contractors to the public treasury. It made special efforts for the relief of wounded and disabled veterans and for the dependents of its deceased members. It condemned the government agencies dealing with these problems in 1919 and 1920 as incompetent and neglectful and in some instances built its own hospitals for veterans. It recommended the consolidation of scattered government agencies of relief into one body, which was done in 1921 when the United States Veterans' Bureau was created. It organized and maintained a nationwide organization, with representatives in every State to inspect hospitals, sanitoriums, and training centres in which disabled veterans are recuperating, and to act as counsel for veterans presenting claims before the Veterans' Bureau.

The Legion was instrumental in organizing veterans' associations in other Allied countries. In Great Britain five veterans' societies united to form the British Legion, modeled closely on the American organization. The Legion was instrumental in forming and extensively financed the Fédération Interalliée des Anciens Combattants, a union of veterans' societies of the Allies. The chief aim of the F. I. D. A. C. is to promote international peace by gradual mutual disarmament among nations. The American Legion urged drastic restriction of foreign immigration until such time as America's present foreign population can be taught the English language and brought into conformity with American traditions, ideals, and standards of life. It favored the perpetual total exclusion of Orientals. At its first convention it demanded of the government measures that should relieve service men and women of financial disadvantages incident to their service. This was the inception of the Legion's fight for an adjusted compensation or bonus law, which finally was passed over the veto of President Coolidge in 1924.

The Legion's second national convention was held at Cleveland in 1920. Frederic W. Galbraith, Jr., of Cincinnati was elected national commander. Mr. Galbraith was killed in a motor car accident at Indianapolis in June, 1921, and John G. Emery, of Grand Rapids, Mich., was selected to complete his term, by the National Executive Committee of the Legion, the ruling body of the organization between national conventions. In 1921 the Legion's national convention was held in Kansas City. Hanford MacNider, of Mason City, Iowa, was elected national commander. The American Legion Auxiliary, composed of mothers, wives, sisters, and daughters of Legion members or of deceased veterans, was organized, and Mrs. Lowell F. Hobart was elected president. In 1923 the fourth national convention was held at New Orleans. Alvin M. Owsley, of Denton, Texas, was elected commander and Mrs.

Kate Waller Barrett of Alexandria, Va., president of the Auxiliary. In 1924 the fifth convention was held, at San Francisco. John R. Quinn, of Delano, Cal., was chosen commander, and Mrs. Franklin Lee Bishop of Leicester, Mass., was elected president of the Auxiliary. The national headquarters of the Legion were in Indianapolis, Ind. In 1924 the organization embraced 68 departments located in the 48 States, the District of Columbia, and 19 outlying possessions and foreign countries. In these departments were situated 11,100 posts, the smallest units of the organization. Departments and posts chose their own officers. National membership in the Legion was granted to all paying national dues yearly, as distinguished from post and department dues. National membership in 1919 was 450,000, 1920, 800,000; 1921, 750,000; 1922, 700,000; 1923, 665,000; 1924 (estimated), 725,000. M. James has chronicled the organization in his *History of the American Legion*.

LEGUIA, AUGUSTO B. (1863-). A Peruvian statesman (see Vol. XIII). In 1919, he was chosen President of Peru for the term 1919 to 1924, succeeding Dr. José Pardo who was made prisoner by the Peruvian troops as the result of the disputed election of May 18. Although assuming the position by a *coup d'état* on July 4, 1919, Leguia's election was afterwards confirmed and legalized by the Peruvian Congress. He was accused by some of his countrymen of being a despot.

LEHIGH UNIVERSITY. A nonsectarian institution for the higher education of men at Bethlehem, Pa., founded in 1866. The student enrollment increased from 672 in 1914 to 1056 in 1923-24, the faculty from 75 to 107 members and the library from 133,200 to 155,000 volumes. The productive endowment in 1914 was \$1,314,000, and the income \$240,000, as compared with an endowment of \$3,000,000 and an income of \$551,085 in 1922-23. Taylor Gymnasium, and Coppée Hall, named in memory of the first president of the university, Dr. Henry Coppée, were built in 1914, an extension to the chemistry laboratory was completed in 1920, and the Alumni Memorial Administration Building, a memorial to the men of the university who died in the War, was completed in 1924. Evening schools in business administration and naval architecture were established in 1920, and in 1923 a university health service, providing dispensary service and annual physical examination for all students, was opened. An endowment campaign for \$4,000,000 was started in 1923. Charles Russ Richards, M.M.E., Eng.D., LL.D., succeeded Henry Sturgis Drinker, LL.D., E.M., as president in 1922.

LEITH, CHARLES KENNETH (1875-). An American geologist, born at Trempealeau, Wis. He studied at the University of Wisconsin, and in 1900, became assistant geologist with the United States Geological Survey, which position he held until 1905. Meanwhile he was called to the University of Wisconsin, where in 1903 he became full professor of geology. In 1905, he became lecturer on pre-Cambrian geology at the University of Chicago. Dr. Leith specialized on pre-Cambrian, structural, metamorphic, and economic geology, and is an accepted authority on the iron districts of the United States and on the origin of iron ores. During the War he was an adviser on minerals to the United States Shipping, War Trade, and

War Industries Boards (1918) and later (1919) to the American Commission to Negotiate Peace in Paris.

LELAND STANFORD JUNIOR UNIVERSITY. See STANFORD UNIVERSITY.

LEMBERG. See GALICIA; UKRAINE.

LENGLEN, SUZANNE. (?-). Tennis player, born near Paris, France. She won the women's Olympic singles championship in 1920 and has since been recognized as the greatest woman tennis player the game has ever known. Because of ill health she was unable to defend her laurels in 1924 either at the English championships at Wimbledon or the Olympic Games at Paris.

LENIN, NIKOLAI (VLADIMIR IL'YICH ULYANOV) (1870-1924). A premier of Russia and leader of the Bolsheviks. He was born at Simbirsk on the Volga, the son of a councilor of state of the Government of Simbirsk. He was Greek Orthodox by religion, educated at the Simbirsk Gymnasium and the University of Kazan, and became prominent after 1890 as a leader of the radical Social Democrats. In 1897, he was exiled to Siberia for three years, and in 1900 left Russia, becoming a member of the Central Committee of the Social Democratic party, and a leader of the Russian émigrés. In 1914 he went to Switzerland, and from there advocated sabotage and armed revolt against the War. He returned to Russia, and when the Kerensky régime was overturned in November, 1917, assumed control of the government of the People's Commissars. The Russian people wanted peace, and he promised it to them. They wanted revenge for wrongs suffered by them and were bent on destroying everything. Lenin told them to take the land and the buildings for themselves—that they were the real owners. The people would not destroy their own property, and in this way about 75 per cent of Russia's wealth was saved. Later, because of the ignorance of the peasants, he encouraged individual initiative in agriculture and industry. At the end of 1921, Lenin became very ill, and for two years was unable to take active part in the administration of the government, and others governed in his name. He died early in 1924. Lenin published several books and pamphlets which attracted much attention. Among his earlier publications are *Two Tactics* (1905) and *Materialism and Empiric Criticism* (1909). See RUSSIA.

LENTELLI, LEO (1879-). A painter and sculptor born in Bologna, Italy, who is instructor of drawing at the Art Students' League, New York. He is best known for his figure of the Savior and 16 figures for the reredos of the Cathedral of St. John the Divine, New York. He also designed groups for the Panama-Pacific International Exposition in San Francisco in 1915. Among his awards was the gold medal for sculpture offered by the New York Architectural League in 1922. He became a member of the National Society of Sculptors in 1907.

LEONARD, ADNA WRIGHT (1874-). An American bishop, born at Cincinnati, Ohio. He was graduated from New York University in 1899 and from the Drew Theological Seminary in 1901. In 1889, he was ordained to the Methodist Episcopal ministry and held pastorates at Porto Rico, Rome, and several cities in Ohio. From 1910 to 1916, he was pastor in Seattle, Wash. In the latter year he was elected bishop.

He is the author of *The Shepherd King* and *Evangelism in the Remaking of the World*.

LEONARD, BENNY (1896-). Professional boxer born in New York City. He began his boxing career in 1912 and five years later won the world's lightweight championship through his defeat of Freddy Welsh of England. He has taken part in two hundred bouts and for six years has successfully defended his world's title against all comers.

LEONARD, WILLIAM ELLERY (1876-). An American educator, born at Plainfield, N. J. He was graduated from Boston University in 1898 and took postgraduate courses at Harvard, at Boston University, and in Germany. He served as instructor and principal in several high schools in New York and in Massachusetts, and in 1906 was appointed instructor of English at the University of Wisconsin. He was successively assistant professor and associate professor of English in that university. He was a member of many learned societies and was the author of *Sonnets and Poems* (1906); *The Poet of Galilee* (1909); *The Lynching Bee and Other Poems* (1920). He also translated many important plays and works from foreign languages.

LEONI, FRANCO (1864-). An Italian composer, born at Milan. He studied at the Mi'an Conservatory under Dominetti and Ponchielli. In 1892, he moved to London. He owes his reputation mainly to his very successful opera *L'Oracolo* (London, 1905; New York, 1915). His other operas are *Raggio di Luna* (Milan, 1888), *Rip Van Winkle* (London, 1897) and *Id and Little Christina* (London, 1901). He also wrote the cantatas *Sardanapalus*, *The Gate of Life* and *Golgotha*, and composed many songs.

LEPROSY. Within the decade 1914-24, an attempt was made to place leprosy almost among the curable diseases, although for centuries it has held its position as one of the 100 per cent fatal maladies. This attitude must not be misunderstood, for the numerous leper hospitals and asylums of the world still contained their normal quota of incurable patients, and doubtless this will be the case for a generation or more to come. The comparatively hopeful attitude was based on several truths, the importance of which was realized fully. Mild incipient cases in young subjects show a certain tendency to self-limitation and the application of combined hygienic resources is alone sufficient to produce the arrest and relative cure of certain cases. In the third place, the drug chaulmoogra oil, and more recently its active principles when isolated, seem to possess a specific virtue against the disease. It is therefore possible to isolate a fractional portion of lepers in whom the prognosis is by no means hopeless, and it ought to be possible to get hold of incipient cases in the relatively young and subject them to early treatment. The problem then bears a resemblance to that of tuberculosis, where the same possibility obtains. The other fraction of lepers will continue to inhabit the leproseries and with time this fraction should become progressively less in numbers and possibly finally be wiped out. A system of parole prevails among the cured lepers in some localities, and the number that return for treatment gives an inkling as to the success of the latter; thus, of the paroled lepers in the Hawaiian Islands under charge of the United

States government, only 8 per cent return for further treatment.

LE ROY, EDOUARD (1870-). A French philosopher, born at Paris. His family were devout Catholics, and the future thinker grew up with a strong mystical vein in his intellectual constitution. He was admitted to the Ecole Normale Supérieure in 1892, and devoted himself first to mathematics and then to philosophy. He received his doctorate in the mathematical sciences in 1898. After serving as professor of mathematics in various lycées, he was called to take Bergson's place in the Collège de France in 1914. In 1919, he was elected to the Academy of Moral and Political Sciences, and in 1921 was formally appointed to the chair of philosophy at the Collège de France. In 1923, he was visiting professor at Columbia University, New York. In his general philosophy, Le Roy, like Bergson, opposed the stereotyped formal intellectualism, which was fashionable at the end of the nineteenth century. He held that there was no essential distinction between the mathematical and physical sciences, that both dealt with facts recognized and organized by the spirit. He also held that there was no essential distinction between scientific rationalism and the religious aspiration for salvation and perfection. He was preparing (1923) three works on these lines; the first dealing with the mathematical sciences, the second with the empirical sciences, and the third with the idealistic aspirations of philosophy.

In addition to studies published in the *Revue de Métaphysique* and in the *Annales de Philosophie Chrétienne*, Le Roy published in 1911 an exposition of the Bergsonian method in philosophy, *Une Philosophie Nouvelle: Henri Bergson*.

LEUSCHNER, ARMIN OTTO (1868-). An American astronomer, born at Detroit, Mich. He was graduated at the gymnasium at Cassel, Germany, and in 1888 from Michigan, and received his Ph.D. from the University of Berlin (1907). He was an instructor of mathematics at the University of California, where in 1907 he became professor of astronomy and in 1913 dean of its graduate school. During the War he was connected with the Chemical Warfare Service with the rank of major and was also associated with the division of physical sciences of the National Research Council. Dr. Leuschner gave much attention to the perturbations of the Watson asteroids and for his studies on this subject he received in 1915 the Watson medal of the National Academy of Sciences. He also made valuable improvements in the methods of determining preliminary orbits of comets and planets, and published various papers on theoretical astronomy.

LEVERMORE, CHARLES HERBERT (1856-). An American educator and peace advocate, born at Mansfield, Conn. He was graduated from Yale in 1879, and after serving as teacher in history in several schools, he became professor of history at the Massachusetts Institute of Technology in 1888, serving until 1893. From 1896 to 1912, he was president of Adelphi College, Brooklyn, and from 1913 to 1917, director of the College and University Bureau of the World Peace Foundation. He was a member and official in many other peace organizations and lectured much on subjects relating to peace. In 1924, he was awarded the

Bok Peace Prize of \$100,000 for the best plan for insuring peace among the nations. He is the author of *The Academy Song Book* (1895); *Students' Hymnal* (1911); *American Song Book* (1917).

LÉVI, SYLVAIN (1863-). A French Orientalist (see VOL XIV). He is a highly esteemed contributor to periodicals devoted to Orientalism and the author of a number of books, among them: *Literary History of Buddhism*, with Winternitz and Huber (1920); a translation with introduction of *La Légende de Nal et Damajanti* (1920), *Contes et Légendes du Bouddhisme Chinois* (1921).

LEVINTHAL, BERNARD LOUIS (1866-). An American rabbi, born at Vilna, Russia. He was educated in the schools of Russia and came to the United States in 1891. In the same year, he was minister of the United Orthodox Hebrew Congregations of Philadelphia, and was the founder and president of the Orthodox Rabbinical Association of America. He was a member of the delegation of the American Jewish Congress to the Peace Conference in Paris in 1919.

LEVITZKI, MISCHA (1898-). A Russian pianist, born at Kremenchug. Having begun his musical studies under A. Michailovski in Warsaw, he continued under S. Stojovski at the Institute of Musical Art in New York (1907-11). The next four years he studied, at irregular intervals, with E. Dohnányi at the Königliche Hochschule in Berlin, winning the coveted Mendelssohn prize. Although he had played in public as an infant prodigy, his career as a full-fledged pianist dates from his début at Antwerp (1912). He then made tours of Belgium, Germany, Austria, Hungary, and Scandinavia. His American début took place in New York (Oct. 17, 1916). In 1921, he made a tour of Australia. He is recognized as one of the masters of the keyboard.

LÉVY-BRUHL, LUCIEN (1857-). One of the leading French philosophers of the sociological school. He was born in Paris and was educated at the Ecole Normale Supérieure. In 1899, he was called to the faculty of the Sorbonne, and in 1918 he was elected to the Institute (*Académie des Sciences Morales et Politiques*). Originally attracted in the direction of idealistic metaphysics, Professor Lévy-Bruhl swung over to the sociological and objective study of the moral sciences. The publication of his book *La Morale et la Science des Mœurs* (1903) created a philosophic furor, owing to the boldness with which he attacked all attempts to rest ethics on metaphysics. He pleaded for the recognition of the relativity of moral laws and customs to the structure of societies. In pursuit of the sociological programme, M. Lévy-Bruhl undertook an interpretation of the mental life of primitive peoples, and published two important works on that subject, *Les Fonctions Mentales dans les Sociétés Inférieures* (1910) and *La Mentalité Primitive* (1922. Eng. trans., 1923). His other works are: *L'Idee de Responsabilité* (1883); *L'Allemagne depuis Leibnitz* (1890); *La Philosophie de Jacobi* (1894); *Lettres inédites de John Stuart Mill à Auguste Comte* (1899); *History of Modern Philosophy in France* (1899).

LEWIS, CLARENCE IRVING (1883-). An American logician. He was born in California and was educated at Harvard University. Aft-

er teaching at the University of California. He was called to Harvard in 1920. He is the author of a comprehensive *Survey of Symbolic Logic* (1918).

LEWIS, GILBERT NEWTON (1875-). An American chemist, born at Weymouth, Mass. He was graduated from Harvard University and studied at Leipzig and Göttingen. He taught chemistry at Phillips Academy and was instructor at Harvard during 1899-1900 and 1901-06, being on leave during 1904-05 to take charge of weights and measures at the government laboratories in the Philippines. In 1907, he became connected with the physical chemistry research work of the Massachusetts Institute of Technology, where in 1911 he was made professor. In 1912 he became professor of chemistry and dean of the School of Chemistry at the University of California. During the War Professor Lewis was chief of the defense division of the gas service with the rank of lieutenant-colonel, and chief of the training division of the Chemical Warfare Service. He published papers resulting from his studies on the thermodynamic theory and its application to chemistry, electric potentials of the common elements, specific heat of electrons, the structure of the atom and the molecule and the theory of valence. The French government conferred on him the Legion of Honor.

LEWIS, ISAAC NEWTON (1858-). An American soldier and inventor, born at New Salem, Pa. He was graduated from the United States Military Academy in 1884 and was commissioned second lieutenant in the Second Artillery. By successive promotions he rose to the rank of colonel in 1913, and was retired in that year for disability incurred in line of duty. He early made himself an authority on ordnance and was sent to Europe in 1900 to study that subject, his report resulting in the re-armament of the field artillery. The machine gun bearing his name was invented by him and after its rejection by the United States was accepted by the British government. During the War it was used by the Allied armies, by the United States Navy, and the airplanes of the United States and Allies. The royalties, amounting to at least \$1,000,000 on guns made for the United States after it entered the War, were declined by him. His other inventions have included a time-interval clock and bell system of signals, a replottting and relocating system for coast batteries, an automatic sight, quick-reading mechanical verniers for use in coast defenses, electric car lighting, and windmill electric lighting systems.

LEWIS, JAMES HAMILTON (1866-). An American legislator (see VOL. XIV). He served as United States Senator from Illinois from 1913 to 1919, as Democrat. He was candidate for governor of Illinois in 1920 but was defeated. In 1914, he served as United States Commissioner representing the United States Senate at London to execute treaty laws for safety at sea. He wrote *The Two Great Republics: Rome and the United States* (1913), and *History of International Law*. In 1918, he was engaged in special war work in France.

LEWIS, SINCLAIR (1885-). An American author born at Sauk Center, Minn. He received his bachelor's degree from Yale University in 1907 and worked on newspapers in New Haven, San Francisco and other cities. He was successively assistant editor of the *Trans-*

atlantic Tales, *Volta Review*, *Adventure*. Publishers' Newspaper Syndicate, and editor with the Geo. H. Doran Co. to 1916. He became universally known in 1920 through his novel *Main Street*, which for the first time in the history of the novel in the United States treated with utter seriousness and perspicuity life in a small town in the Middle West. This was the manifesto for a new school of Western writers which had been growing since shortly before the War, and the Middle West assumed a dignified and assured place in the literature of this country. His *Babbitt* (1922) treats of the development of a man's bourgeois soul in the Middle West, his one attempt at revolt, and his subsequent return to the respectable fold. Other novels are: *Our Mr Wren* (1914), *The Trail of the Hawk* (1915); *The Job* (1917); *The Innocents* (1917); *Free Air* (1919); *Dr. Arrow-smith* (1924). He also wrote a play, *Hobohe-mia*, which was produced in New York City in 1919, and has contributed short stories to the *Century*, *Saturday Evening Post*, and other magazines.

LEWIS, SIR THOMAS (?-). A British physician and leading authority on heart disease. Born in Cardiff, Wales, he was educated in the local university, and received the degree of M.B. in 1905 from the University of London. He subsequently lectured on cardiac pathology in his Alma Mater and when the periodical *Heart* was established became its editor. He was knighted in 1921. Lewis has written much on the heart, his major publications comprising *The Mechanism of the Heart Beat* (1911); *Clinical Disorders of the Heart Beat* (1912); *Clinical Electrocardiography* (1913); *Lectures on the Heart* (1915); *The Soldier's Heart and the Effort Syndrome* (1919); *The Mechanism and Graphic Representation of the Heart Beat* (1921).

LEWIS, WARREN KENDALL (1882-). An American chemist, born at Laurel, Del. He was graduated in 1905 from the Massachusetts Institute of Technology, and in 1908 received his Ph.D. at Breslau. In 1908, he became a research associate in the laboratory of applied chemistry at the Massachusetts Institute of Technology, where in 1910 he became professor of chemical engineering. During the War, he was an assistant in charge of defense problems of the research division of the Chemical Warfare Service. Dr. Lewis contributed articles on chemical technology to Thorp's *Outlines of Industrial Chemistry* and also to various scientific journals.

LEWISOHN, LUDWIG (1882-). An American author born in Berlin. He came to the United States with his parents in 1890, and received his education in the public schools and at Columbia University. He taught German in the University of Wisconsin (1910-11) and at Ohio State University (1911-19). During his teaching years he devoted much time to writing and in 1919 was dramatic editor for the *Nation*, in 1920, becoming associate editor of that magazine. He made several translations from the German, chief among which are the dramatic works of Gerhart Hauptmann (1912-17). His best known book is *Upstream* (1922), an autobiography in which is set forth a searching criticism of the intellectual and artistic life of this country. His novel, *Don Juan*, which appeared in 1923, deals with the problem of divorce. Others of his works are: *An Introduc-*

tion to the Study of German (1910); *The Modern Drama* (1915); *The Spirit of Modern German Literature* (1916); *Poets of Modern France* (1918); *The Drama and the Stage* (1922); *The Creative Life* (1924).

LEXER, ERICH (1867-). A German surgeon, known especially for his efforts in transplanting joint surfaces and other plastic work of the same kind. Born in Würzburg, he received his medical degree from the university of that city in 1890 and was made professor of surgery at the University of Jena in 1910. His first work on surgery was his *Lehrbuch der Allgemeinen Chirurgie* (2 vols., 1904-05, republished, 1914). At a later period, with Garré and Küttner, he brought out the *Handbuch der Praktische Chirurgie*, which was reissued in six volumes, 1921-23. He also summed up his war and post-war experiences in his *Wiederherstellungschirurgie* (1920).

LEYEN, FRIEDRICH VON DER (1873-). A German writer and professor of Old German philology at the University of Cologne. He was born at Bremen and studied at Marburg, Leipzig, and Berlin. Included among many works he published are: *Des Armen Hartmann Rede vom Glauben* (1897); *Indische Märchen* (1898); *Das Märchen in der Göttersage der Edda* (1899); *Götter und Göttersagen der Germanen* (1909); *Das Märchen* (1911); *Die Deutschen Heldensagen* (1912); *Das Studium der Deutschen Philologie* (1913); *Deutsche Volkskunde und Deutscher Unterricht* (1915); *Eindrücke aus Amerika* (1915); *Aufgaben der Goethe-Gesellschaft* (1916); *Das Deutsche Märchen* (1917); *Die Deutsche Dichtung* (1918). He also edited works of Herder, Schlegel, Wackendorfer, Hertz and others.

LIBERIA. A Negro republic on the west coast of Africa. Area variously estimated at 40,000 square miles. The population was estimated at 1,500,000, of whom American Liberians numbered 12,000; the capital, Monrovia, had 6000. In 1922, the enrollment in all the Liberian schools was placed at only 9000. Agricultural methods were still primitive and the country's economic resources, e.g. minerals, ivory, hardwoods, had hardly been tapped. Leading products included cocoa, cotton, coffee, piassaba fibre, palm oil, and kernels. Imports were rice, gin, tobacco, cotton piece goods, building materials. Trade was mainly with the United Kingdom, Liberian exports in 1913, 1920, and 1923 being £56,709, £537,362, and £57,311, and imports for the same years, £90,258, £271,992, and £115,581. Trade with the United States in 1913 and 1923 was: imports, \$96,900 and \$175,032; exports, \$2319 and \$17,790. In 1912-13, revenues were \$618,800 and expenditures \$529,548. In 1917-18, these had dropped to \$273,000 and \$255,700. For 1921, revenues totaled £90,395 and expenditures £107,109. In 1918, customs duties brought in £162,120; in 1920, \$314,690; in 1921, \$197,139. In 1918, the total debt was \$2,131,700 made up of: \$1,608,000 refunding loan of 1912; \$423,128 internal floating loan; \$84,603 due the Bank of British West Africa; \$15,969 owed by the post office. The customs office was administered by an official appointed by the United States. The police force, maintained for the security of the revenue, cost \$72,000 in 1918. The only means of inland communication was a motor road 20 miles long. There were no railways or telegraphs. There were two wireless stations at

Monrovia and cable lines from there to Europe and New York.

The entry of the United States into the War paved the way for Liberian participation. In August, 1917, Liberia declared war on Germany and seized the opportunity to eject the Germans, who up to that time had controlled more than 75 per cent of Liberia's trade. In 1918, a German submarine, in retaliation for the seizure of German property, shelled Monrovia and sank the single vessel which constituted the country's navy. Beginning with 1920, the United States began to occupy the leading rôle in Liberia's affairs. The direct occasion for this move was the fact that, in 1918, the United States had placed to the credit of Liberia for war expenditures the sum of \$5,000,000. Only \$26,000 was used before the War terminated with the result that a proposal was made that the whole be carried as a government loan to Liberia. Difficulties in closing the terms brought a Liberian mission to the United States. The United States, in order to advance the economic development of the country and at the same time to secure the proposed loan, sought to gain control over the administration of customs, posts, commerce, road building, etc. In spite of President Harding's approval, the loan failed of passage in the Senate (September, 1922), as a result of the attack made on it by Senator Borah who charged that undue influence was being exerted by American financial interests that held worthless Liberian securities. The rejection of the loan seemed to please many Liberians and the Liberian government declined to accept the same amount from private sources upon the conditions demanded by the American government. However, it was evident that the failure of the loan left Liberian finances in a very precarious position, and endangered the security of the funds advanced in 1912. In 1923, Liberia was on the verge of bankruptcy. Government salaries had not been paid; the administration was borrowing from British banks in hand-to-mouth fashion; English and German interests had gained control of shipping, and France of the cables and wireless. The president for 1916-20 was Daniel E. Howard; for 1920-24, C. D. B. King.

LIBERTY LOANS. See UNITED STATES, *History*.

LIBERTY TUNNEL, PITTSBURGH. See TUNNELS.

LIBRARY ASSOCIATION, AMERICAN. During the War the Association organized and administered library service for the army, navy, and marine corps at the request of the United States government, mobilizing several hundred libraries for the work. Five million dollars and several million books and magazines were collected. Fully equipped libraries were maintained in the principal camps and stations, with small branches in recreation buildings. Collections of books and magazines were sent to small camps and posts, to naval ships and army transports. A reasonably adequate service was rendered to troops overseas, with special emphasis in 1919 on the educational work. Hospital library service became an important feature in 1919-20. At the end of the War, the Army and Navy Departments took over the service, and later, the Veterans' Bureau took over the highly organized library service for men in hospitals.

In 1919-20, the Association prepared a great

extension programme, but the financial campaign was not fully organized and resulted in donations of less than \$100,000 for the new work. Some increase in the Association's extension service was made possible, however, and the publicity for the campaign greatly stimulated general interest in the development of libraries. In 1924, a commission was appointed to investigate the need and the demand for adult education, the work of agencies now offering this, and especially the work of libraries in this field; to formulate recommendations concerning new methods for increasing the library's usefulness, and new schemes to enable libraries and schools to teach the habits of reading and study more successfully.

The council at its meeting on June 30, 1924, created a permanent Board of Education for Librarianship, the first important effort to standardize education for the library profession. The Committee of Five on Library Service had completed the preliminary work of its survey of library practice and methods.

The cost of a union list of the holdings of periodical files in American libraries was covered by advance subscriptions from libraries and by a gift from the Laura Spellman Rockefeller Memorial. A gift of \$50,000 from the American Committee for Devastated France made possible the establishment and operation for two years of a library school in Paris, offering summer and winter courses in American library practice, adapted to French needs. Gifts were received by the Association from the Laura Spellman Rockefeller Memorial in 1923 and 1924 for the purchase of American books for libraries in European countries whose depreciated currency made impossible the purchase by them of American publications, and books and periodicals were being supplied, in response to requests, to Germany, Austria, Hungary, and Poland; while American libraries contributed from their duplicate collections several thousand volumes for the American Library in Paris and other European libraries, and for libraries destroyed by the earthquake in Japan. Beginning in 1922, the Children's Librarians' Section made an award annually for the most distinguished book for children published in America during the year, the award being made possible by a gift from Frederic Melcher of New York. Other important gifts received during the latter years were: from the Carnegie Corporation of New York, \$164,100 for various studies, publications and current activities; and from the Carnegie Endowment for International Peace, \$5000 for American books on public law, including international law, for European libraries.

The Association published many books and pamphlets on library work, not for profit but in the interest of library development. There were also several reading courses, reading lists, publicity leaflets, posters and other minor publications, and a series of textbooks for use in library training agencies and a new series of reading courses for adults was begun. *The Booklist*, the librarian's guide to new books, was issued monthly, except in July and August.

Annual conferences were held in different parts of the country, the largest in 1921 at Swampscott, Mass., with an attendance of about 1900. The membership of the Association increased from 2905 in 1914 to more than 6000 in 1924.

LIBRARY PROGRESS. The decade 1914-24 was noteworthy in American library affairs. The library war service of the American Library Association (q.v.) gave wide publicity and new impetus to the library movement. Few cities and large towns were without libraries in 1924. Many counties had established and were maintaining library service for rural as well as urban populations. Most universities and colleges had organized libraries. Nearly every high school had a library of some sort, and some of them were well organized for effective service. Perhaps the most important features of library progress during the 10 years were (a) the great increase in the number of libraries and of library buildings, and (b) the development of new types of library service.

Grants of nearly \$11,000,000 were made for library buildings from 1914 to 1922 by the Carnegie Corporation of New York, most of it for the erection of comparatively small buildings. Many small buildings were erected from other private donations and from public funds. Several large buildings had been or were being erected from public (or in a few cases private) funds, notably the central public libraries in Philadelphia, Brooklyn, Detroit, Cleveland, Richmond, Savannah, Indianapolis, Providence, Wilmington (Del.), St. Paul, Houston, Sacramento, San Francisco, Los Angeles, and Montreal; and libraries at a good number of colleges and universities. The Henry E. Huntington Library was erected in Pasadena, and the great Morgan Library opened to the public in New York City. The Carnegie Corporation discontinued the giving of money for library buildings during the latter years "in the belief that so many of these have been provided, and so many communities have received the impulse for library facilities, that the purpose which Mr. Carnegie had in view has been in large measure accomplished."

In the latter few years there was growing up a new respect and a greater demand for adult education, and libraries were finding in this new interest an opportunity to increase the service they had always rendered and to develop new types of service. The Chicago Public Library in 1923 created a Reader's Service Bureau whose function was to increase the usefulness of the library to men and women who wish to continue their education out of school. This Bureau aimed to prepare outlines for the study of any nonvocational subject for patrons interested in following a definite course of reading, while the library undertook to supply the books prescribed in sufficient quantity to meet promptly all reasonable demands. Many other libraries had readers' assistants rendering similar service to the serious individual student. The Milwaukee Public Library made a survey of all adult education classes in the city and was attempting to make the library serve these classes. The Cleveland Public Library was attempting to make appropriate connections between the library and the adult student. The Indianapolis Public Library organized a new department to give special attention to the educational needs of young men and women and older boys and girls out of school. Adult education was the main theme of the American Library Association conference in 1924.

During the later years several States passed laws and issued regulations requiring the maintenance of adequate libraries in schools

and the teaching of the use of books and libraries as a part of the curriculum. In a few States accredited high schools were required to employ trained librarians after a fixed date. The county library was coming to be accepted as the best form of library service for reaching rural as well as urban residents, except in those few eastern States where the county is an unimportant unit of government. In 1924, more than half the States had laws permitting counties to establish libraries and to levy taxes or make appropriations for their support. The actual establishment of county libraries, however, was moving slowly. California led in the movement. After the War there was a fairly general recognition of the therapeutic value of books in hospitals. The War and Navy Departments, the Public Health Service, and the Veterans' Bureau had come to recognize the necessity, not only of reading matter, but of skilled library service in hospitals. Many public libraries were organizing library service for the private and public hospitals in their communities. Gradual progress was also being made in the development of library service for men in penal and correctional institutions. Special libraries in business houses, industrial plants, banks, bond houses, insurance offices, etc., were increasing in number from year to year in spite of the set-back during the depression of 1920-21. The library service for the merchant marine, originally a feature of the Library War Service of the American Library Association, was taken over in 1921 by the American Merchant Marine Library Association, 82 Beaver St., New York, N. Y., organized for that purpose.

Other important developments in the latter few years were: Greater emphasis on library publicity; increased attention to education for library work; a growing recognition of the importance of special training for scholarly bibliographical work (as indicated by the establishment of a chair of bibliography at Yale); and more international library interests. It was estimated that there were between 8000 and 10,000 public, college, school and special libraries in the United States, and between 20,000 and 25,000 library workers. An excellent book on the subject is Bostwick, *The American Public Library*, published by Appleton.

LIBYA. An Italian colony on the north coast of Africa, between Tunis and Egypt. It consists of the two provinces of Tripolitania and Cyrenaica. Its area is estimated at 406,000 square miles; its native population (census of Dec. 1, 1921) was 569,093. The total estimated population was put at 1,000,000 divided racially into 30 per cent Arabs, 40 per cent Negroes, 23 per cent Jews, 7 per cent Europeans. The civil European population in 1921 numbered 28,364, made up mostly of Italians and Maltese. Tripoli, the capital of Tripolitania, had 73,000 inhabitants; Benghazi, capital of Cyrenaica, 35,000. The country is largely desert, but in the coastal region and in the highlands, agricultural and pastoral activities are carried on. Barley was chiefly grown, but henna and dates were also cultivated. Other articles of trade consisted of sponges, tunny fish, ostrich feathers, potatoes, matting, fats, honey, and hides of camels, oxen, sheep, and goats. For want of irrigation, agriculture was necessarily restricted. The caravan trade into the Sudan, formerly very important, was being diminished because of the

French occupation of Timbuktu and the presence of the Kano-Lagos railway in British Nigeria. Principal exports into Sudan were cotton and woolen goods, blankets, rugs, tea, coffee, sugar, paper. Imports from the Sudan were ivory, ostrich feathers, hides and skins, leather objects. Imports by sea into the colony included wines and liquors, oils, sweetmeats, chemical products, cotton, woolen, and silk yarn, iron and steel manufactures, tobacco and matches. Total exports in 1912 for both provinces were \$777,597 (a lira converted at \$0.193); for 1921, they were \$1,476,300 (lira converted at \$0.04). Total imports for 1912 were \$5,361,926; for 1921, \$7,192,700. In 1914, the budget balanced at \$13,795,100; for 1922-23, the budget estimate for expenditures was \$12,477,950 (lira converted at \$0.048). In the latter year the state contribution toward revenues was \$9,738,144. The Italian government maintained 13,000 men in Tripolitania and 9600 men in Cyrenaica for defense purposes. There were in all 163 miles of railway in operation to supplement the principal means of communication, i.e. caravan routes. By the Treaty of Lausanne (Oct. 18, 1912) the Turkish evacuation of Libya paved the way for Italian occupation. The pacification of Tripolitania proceeded without difficulty so that by 1915 the coastal region was well under Italian control. In Cyrenaica, however, great difficulties were encountered. The Senussi continued in possession of the interior and stubbornly contested the scheme of Italianization. Fighting went on during 1914 and 1915 and so successful were the insurgents that the inland garrisons had all to be abandoned and Italy was once more reduced to her coastal possessions. In 1916, with Turkish aid, the Senussi brought the fighting into the coastal region, and but for the failure to unite all the insurgent forces, almost succeeded in expelling the Italians entirely. The end of the War found the local chieftains unable to effect a common understanding among themselves. To gain over the local tribes the Italians, after the War, deemed it necessary to grant autonomy. A parliament was set up, and as a result of peace being established with the Senussi in November, 1920, the Italians were able to resume once more their penetration with only occasional molestation. By arrangement with France in 1919, the western frontier of Tripoli was laid out to extend in a curve from west of Ghadames to south of Tumm. Similarly, as a result of an understanding with Great Britain, Jarabab, on the Egyptian frontier, was ceded to Italy.

LICHNOWSKY, KARL MAX, PRINCE (1860-). A German diplomat. He served in important capacities in several embassies, and at the outbreak of the War was German Ambassador in London. He endeavored, by every means in his power, to prevent the outbreak of war, and on its outbreak, left London and went into retirement. Here he wrote an account of his "mission to London," which was privately circulated. Extracts appeared in a Swedish newspaper, in March, 1918, and shortly afterwards were published in book form. In this he brought serious charges against Germany. The book made a great sensation and provoked the consternation of Germany. Although Ludendorff urged that proceedings be taken against Lichnowsky, nothing was done.

LIEBKNECHT, KARL (1871-1919). A

prominent German Socialist (see Vol. XIII). Called to the army in 1915, he served on the western front, which brought upon him violent censure from his party. Attacking the militarism of the government in open session of the Diet in 1916, he was expelled and soon after convicted of high treason for participation in a Socialist May Day celebration. He was sentenced to four years of penal servitude and loss of civil rights, but was released in October, 1918. Engaging at once in revolutionary activities, he was killed by the Nationalists in the Berlin revolt of Jan. 16, 1919. Among his later works are: *Gegen den Bürgerlichen Militarismus* (1920); *Politische Aufsätze aus Seinem Nachlasse* (1921); *Reden und Aufsätze* (1921); *Studien über die Bewegungsgesetze der Gesellschaftlichen Entwicklung* (1922). See *GERMANY, History*.

LIECHTENSTEIN. One of the smallest independent European states lying between the Austrian province of Vorarlberg and the Swiss cantons of St. Gallen and Graubünden. Its area is 61.4 square miles; its population (1912), 10,716. The budget for 1922 balanced at 384,500 francs. In October, 1921, a new constitution providing for a diet of 15 members, elected by direct vote on the basis of universal suffrage and proportional representation, was adopted. In 1921, the principality, heretofore the ward of Austria, joined the Swiss Customs Union and turned the administration of its posts and telegraphs over to Switzerland.

LIENHARD, FRIEDRICH (1865-). A German poet and novelist (see Vol. XIV). He published after 1914: *Der Einsiedler und Sein Volk* (1914), a volume of short stories; *Lebensfrucht*, his collected verse (1915); *Jugendjahre*, recollections of his youth (1918); *Westmark*, a novel (1919); *Der Meister der Menschheit* (1919); *Wer Zuletzt Lacht* (1921); *Aus Taulers Tagen* (1924). He edited *Der Turmer*, a magazine published in Weimar.

LIGGETT, HUNTER (1857-). An American army officer, born at Reading, Pa. He was graduated at the United States Military Academy in 1879 and was made a second lieutenant in the 5th Infantry. By successive promotions he reached the rank of major-general in 1917 and was retired in 1921. He served in campaigns against the Indians and during the war with Spain was in Cuba, with the rank of major of volunteers. Later he was in the Philippines, and subsequent to his return to the United States, after various duties, he was sent to the Army War College, where he was graduated in 1910 and of which he was president in 1913. In 1914, he served on the Mexican border and in 1917 commanded the Department of the Philippines. During the War he was in France as commander of the 41st Division (1917-18) and then with the 1st Army Corps (1918-19) with the rank of lieutenant-general. Later he was on the Rhine in command of the 3d Army (1919). He took part in the second battle of the Marne and participated in the engagement at St. Mihiel and in the Meuse-Argonne campaign. On his return to the United States he was assigned to the command of the Western Department with San Francisco as his headquarters. For his services in the War he received the Distinguished Service Medal of the United States, the decorations of the Legion of Honor from France, the Order of Leopold from Belgium, and the

Order of St. Maurice and St. Lazarus from Italy.

LIGHTHOUSES, AND OTHER AIDS TO NAVIGATION. It was quite natural that but little attention should be paid to lighthouses and other aids to navigation during the War, although in the United States progress in installation and development was fairly steady except during the period of the country's actual engagement in hostilities and its readjustment to peace conditions. With the restoration of normal conditions came important developments in most of the countries of the world, rather in the provision of improved illuminants and signalling devices, in increasing the number of such marks as gas buoys, and particularly in installing radio apparatus for signals and for communications. In the construction of notable light towers or other structures not much of importance was done between 1914 and 1924, but the improvement of equipment in the interest of better navigation as well as general efficiency and economy was significant. Thus the improvement of lights on rivers and bays was marked and the placing of acetylene buoys to mark the Ambrose Channel of the New York harbor in 1920 was a distinct advance. On the Mississippi and Hudson Rivers also there has been a marked improvement in the lights. With the extensive development of aeronautics, lighthouse authorities were giving consideration to the utilization of coast lighthouses in aerial navigation, but little had been done in determining modifications needed for existing equipment. For the American Transcontinental Mail route an elaborate system of illumination and light marks had been devised. See **AERONAUTICS**.

Automatic Lighting. In the period following the War automatic lighting was a leading consideration for the lighthouse services of the various countries of the World. It was extensively introduced, even at the more important stations, although in the latter instances one keeper usually was retained, and the installation was quite costly. Such lights for the most part employed dissolved acetylene, and for the higher illuminating power there was a lens revolved by the gas pressure, while the flame was produced by the combustion of a mixture of acetylene and air under an incandescent mantle, with automatic mantle exchanger. European automatic lights and light sectors were in many cases more complicated than those employed in the United States. Automatic lighting by incandescent electric lamps had been extensively developed in some countries for unwatched or semiwatched stations, even those of primary importance. Here were often employed large light bulbs approximating 1 foot in diameter, with spirally wound filaments in gas-filled bulbs. The large current required was supplied from commercial sources or by automatic power units at the station. In some of the apparatus, particularly that for the coast of Holland, where this system was extensively introduced, the electric light had a reserve gas light which was automatically swung into focus or set in operation in another lens on the failure of the electric light.

The United States Lighthouse Service in 1923 had in commission more automatic apparatus than similar services in any other country in the world. Of 4047 coast and lake

lights, 1665, or 41 per cent, were automatic, doing the work of 765 lighthouse keepers and assistants. In addition, 608 lighted buoys, which could not be maintained by human attendance and which were invaluable aids to mariners, were automatically operated and aided night navigation on many important rivers and channels. This tendency to provide automatic installations is indicated by the fact that during the fiscal year 1923, 30 stations were put on an automatic basis, with an annual saving of 76 per cent of the cost of the changes. Thus, in addition to many automatic gas buoys, new automatic lighthouses were installed at important points, as at Molasses Reef and Pacific Reef, two important unlighted stretches of the Florida Reefs.

Fog Signals. A most important development in the way of improving coastwise navigation was fog signals which by the use of radio were to send out from transmitting stations signals appropriate to the locality. These could be detected on vessels equipped with ordinary receiving apparatus. The first radio fog signals in the United States were placed May 1, 1921, on the Ambrose Channel Light vessels at the entrance to the New York harbor, on the Fire Island light vessel, and on the Sea Girt (N. J.) lighthouse, all in the vicinity of New York harbor. Eight radio fog signals were in operation in 1923, one at Cape Henry, Va., one on the Diamond Shoals lightship in North Carolina, and one on the Blunts Reef lightship off Cape Mendocino, Cal. Five additional radio fog signals were later installed in lightships at Boston, Mass.; Five Fathom Bank, Del.; Swiftsue Bank, Wash.; in the Columbia River; and off the Straits of Fuca. These instruments furnished, with proper precautions, bearings approaching the accuracy of visual bearings, and were available at greater distances. See RADIO TELEGRAPH.

In 1924 a power tube radio fog signal transmitter was placed in commission on Ambrose Channel lightship. This was the first tube transmitter used in the United States for fog signal purposes. This transmitter was installed by the United States Lighthouse Service after extensive tests indicating freedom from directional distortion, lessened interference, and increased efficiency. While the radio fog signal stations in the United States had used spark transmitters, it was found that tube transmitters would provide a signal which could be tuned more sharply to the wave length prescribed for radio fog signals. Comparative tests of the tube and spark transmitter indicated that the former would give signals equally effective with at least one-third less power than the spark transmitter. Installations of radio fog signals had been provided in France, Spain, Norway, Scotland, England, and Holland, though less extensively than in the United States. It was universally recognized that instruments for determining the radio bearing should be located on shipboard, and some 100 European craft were equipped in 1923 with radio direction finders. Aside from the use of radio, the principal advance noted in fog signals was the further introduction of automatic apparatus for minor signals, such as bells, along the lines described or of similar nature. Explosive signals were used to some extent, but the advantage of small installation cost was offset by the continuous manual attention required.

United States Lighthouse Service. On June 30, 1923, there were maintained by the United States Lighthouse Service, which is by far the largest lighthouse organization in the world, 16,888 aids to navigation, including 5942 lights of all classes and 596 fog signals (not including 153 buoys with whistles and 397 buoys with bells), of which 7 were radio signals, 6 were bells operated automatically by gas, and 46 were submarine signals. The accompanying table gives a summary of the aids to navigation under each class in commission at the end of the fiscal years 1914 and 1923.

Class	June 30, 1914	Total, June 30, 1923
Lighted aids:		
Lights (other than minor)	1,588	1,915
Light vessel stations	52	47
Gas buoys	453	430
Gas buoys, with whistles and bells ^a		233
Minor lights	2,793	3,147
Float lights	118	170
Total lighted aids.	5,004	5,942
Fog signals:		
Radio		7
Sound fog signals (air)	519	543
Submarine fog signals	48	46
Gas buoys, with whistles and bells ^a		233
Whistling buoys, unlighted		86
Bell buoys, unlighted	233	241
Total fog signals	886	1,146
Unlighted aids		
Buoys	6,330	7,276
Day beacons	1,978	2,757
Total	8,308	10,033
Grand total	14,198	16,888

^a Gas buoys with whistles and bells are counted only once in the grand total.

In the period between 1910 and 1920 there was a net increase of 4611 in the total number of aids to navigation in the United States. The number of gas buoys increased two and one-half times and the number of lighthouses, equipped with brilliant oil vapor lights, increased four times. The number of automatic gas lights ashore increased nearly seven times, effecting an important economy in the cost of attendance. In 1924 radio equipment had been placed on more than half of the tenders and telephone communications between shore stations. Acetylene buoys were in standard use and were placed at important channels.

In Alaska during the period from 1914 to 1924, many new aids to navigation were established, so that on June 30, 1923, there had been provided a total of 650 aids to navigation in this Territory. This was a steady growth from 1910, when there were but 160 such aids. In 1923 there were 227 lights, 14 gas buoys, 11 fog signals, 271 buoys and 127 day marks. The United States Lighthouse Service had been active in the other Territories and outlying districts, where increased commerce rendered additional aids to navigation essential. Thus in 1921 there was built a new light station and buildings at Point Borinquen, at the northwestern extremity of Porto Rico, at a location where the necessity of a landfall light was emphasized by the opening of the Panama Canal and its increasing use. This new light was placed on a reinforced concrete structure of cylindrical form located 233 feet above sea level. It was simple in design and heavy and strong enough to resist earthquake shocks. It was built on a concrete foundation 25 feet square by six feet deep, and the main tower was 15 feet in diameter with walls 15 inches thick.

and rising to a height of 46 feet; above it was a service room and a standard helical bar lantern. The illuminating apparatus consisted of a third-order 12-panel flashing lens on a mercury float with a 55 mm. type A incandescent oil vapor lamp. This light shows a group of four white flashes of 32,000 candle power every 30 seconds and is visible 24 miles. At Guam a valuable new light was installed at Hole-in-the-Wall in 1923 by the United States Lighthouse Service. Lights were also maintained at Guantánamo and Samoa. At these last three points the aids to navigation are maintained under the direction of the Naval Commandant by means of allotments from the appropriations for the Lighthouse Service.

LIGNIN. See **CHEMISTRY, ORGANIC.**

LILLENFEIN, HEINRICH (1879-). A German dramatist and novelist. He was born at Stuttgart and studied history and philosophy at the universities of Tübingen and Heidelberg. He became general secretary of the *Deutsche Schillerstiftung* at Weimar. Among his later works are: *Der Herrgottswarter* (1906); *Der grosse Tag* (1907); *Der Schwarze Kavalier Olympias* (1908); *Der Stier von Oliveira* (1910); *Die Herzogin von Palliano* (1914); *Hildebrand* (1917); *Die Ueberlebenden* (1920). His principal works of fiction are: *Die Grosse Stille* (1912); *Der Versunkene Stern* (1914); *Im Stillen Garten* (1915); *Ein Spiel im Wind* (1916); *Die Feurige Wolke* (1919). He also wrote *Heinrich Vierodt, das Profil eines Deutschen Dichters* (1915).

LILLIE, RALPH STAYNER (1875-). An American physiologist, born at Toronto, Ont., Canada. He was educated at Toronto University, at the University of Michigan and at the University of Chicago (Ph.D., 1901). He was instructor in physiology and histology (1902-03) and adjunct professor (1903-05) at the University of Nebraska; instructor in physiology at Harvard (1905-06); instructor in physiology and zoölogy (1907-11), and assistant professor (1911-13) at the University of Pennsylvania; professor of biology at Clark University (1913-20); biologist at the Nela Research Laboratory, Cleveland, Ohio (1920-24); and instructor in physiology at Woods Hole, Mass. (1901). He published extensively in scientific journals on osmotic pressure of colloids, physiology of growth processes, and articles on protoplasmic transmission.

LIMBURG. Upon the region of South Limburg, in southeastern Holland, centred the chief Belgian demand for territorial compensations. This Dutch province, with an area of 847 square miles and a population (1922) of 459,620, had been given to Holland by the Treaty of 1839, against the protests of the Belgians. At the Versailles Conference, Belgium once more pressed her claims, not on grounds of ethnography, for the people are plainly Dutch, but for historical, strategic, and economic reasons. Limburg had taken part in the Belgian revolution of 1830. It was vitally necessary for the protection of the Belgian frontiers, for it dipped south to touch Belgium on the east and thus controlled the defense of the Meuse. The position of the Meuse in the disputed district was perhaps the most serious of the Belgian grievances, for the Dutch possession of this

waterway, with its important bridgehead at Maestricht, imposed an effective check on the progress of Belgian commerce. Similarly, Limburg seemed vitally necessary to Belgium if the Rhine-Scheldt Canal, which was guaranteed by the Peace of Versailles, was ever to become a reality. Limburg, formerly neglected by the Dutch, became a source of real interest during the War; the lignite mines opened up there were producing 1,425,617 tons in 1918 and some 400,000 tons more in 1919. The Peace Conference, however, refused to countenance the transfer of the territory; the only step it would take was the establishment of an international commission to investigate the matter of the Treaty of 1839. Territorial compensation was thus out of the question. Only after lengthy negotiations was it possible for the two disputants to come to terms on the matter of waterways. In 1920 an agreement was reached on the administration of the Scheldt, the Antwerp-Meuse-Rhine Canal, and two other water-systems; with this, Belgium had to remain content.

LIME. In 1922, there were 530 plants in the United States engaged in the production of lime, and these were scattered widely, being distributed throughout nearly every State in the union. The more important districts were in Southern Pennsylvania, the Toledo district of Ohio, and the Shenandoah Valley district of Virginia and West Virginia. The production in 1922 was 3,639,617 short tons, valued at \$33,255,039. About one-half of the lime produced is used in the building trades. In 1922, agriculture used 7.5 per cent of the output, this being a decrease from previous years' consumption in this field, while the remainder was employed in various chemical industries, such as paper mills, glass works, tanneries, metallurgical plants, sugar factories and the manufacture of chemicals and for other purposes, with about 140 different industries in which lime is regarded as essential. Lime is sold either in lump or in ground form and by means of the air separation process a very pure product is obtained and the ease of shipping and handling has been increased so that it is more widely used than ever.

LIMING. See **FERTILIZERS.**

LIND, SAMUEL COLVILLE (1879-). An American physicist, born at McMinnville, Tenn. He was graduated at Washington and Lee University in 1899 and at the Massachusetts Institute of Technology and received his Ph.D. at Leipzig, Germany. He was assistant in chemistry at the Massachusetts Institute of Technology and assistant professor of general and physical chemistry at Michigan (1905-15). Meanwhile he became interested in radioactivity and studied in Paris (1910) and at the Radium Institute in Vienna (1911). In 1913, he was appointed chemist for the United States Bureau of Mines in charge of radioactivity and in 1918, he became director of its rare and precious metals station in Reno, Nev. Dr. Lind published papers on radium extraction and measurement, on the influence of radiation on chemical action, and relation of gaseous ionization to chemical action; he is also the inventor of the Lind interchangeable electroscope for radium measurements.

LINDSAY, (NICHOLAS) VACHEL (1879-). An American poet and artist (see Vol. XIV). In 1910, when he published the *Village Magazine*, he was almost unknown but since then he has been recognized as one of the main hopes

of American poetry. Technically and æsthetically he is full of inaccuracies, but his poetry is strong and vital and many of his poems have the true ballad ring. He is one of the strongest forces in the development of the epic of the West in the United States. He has recited before many school audiences in this country and in England. His chief works are: *Handy Guide for Beggars* (1916); *The Art of the Moving Picture* (1915); and the volumes of poems entitled *General Booth Enters Heaven* (1913); *Congo and Other Poems* (1914); *The Chinese Nightingale and Other Poems* (1917); *The Golden Whales of California and Other Poems* (1920).

LINDSEY, BEN (JAMIN) B (ARR) (1869-). An American jurist and reformer (see Vol. XIV). He was active in the organization of the Progressive party and was a member of its National Committee in 1912. He lectured much throughout the country on children's problems. He was the author of *The Rule of Plutocracy in Colorado*; *The Doughboys' Religion* (1919), and *Pan-Germanism in America* (1919).

LIPPMANN, WALTER (1889-). An American writer (see Vol. XIV). He resigned as a member of the staff of the *New Republic*, in 1915, to become assistant to the Secretary of War. He served also as secretary for the organization directed by E. M. House to prepare data for the Peace Conference. During the War he served as captain of the Department of Military Intelligence. He was attached to the 2d Section of the General Staff at General Headquarters in France. He served also in Paris during the Peace Conference. His later books include *The Political Scene* (1919); *Liberty and the News* (1920); *Public Opinion* (1922). Later he joined the editorial staff of the *New York World* and in 1924 became its chief editorial writer.

LIQUIDS. See PHYSICAL CHEMISTRY.

LISSAUER, ERNST (1882-). A German poet. He was born in Berlin and studied at Leipzig and Munich. He first attracted attention by his lyric volume *Der Acker* (1907), which was followed by *Der Strom* (1912), a tribute to the centenary of the Wars of Liberation, entitled *1813*, and *Zyklus* (1913). At the outbreak of the War he published a series of pamphlets, *Worte an die Zeit* (1914), and attained notoriety by his *Hymn of Hate*. He later wrote: *Der Brennende Tag* (1916); *Idyllen und Mythen* (1916); *Das Ewige Pfingsten* (1919); *Der Inuendige Weg* (1920); two dramas, *Eckermann and Yorck* (1921); a series of one-act plays, *Gesichte* (1922); and an appreciation of the genius of Anton Bruckner, *Gloria Anton Bruckners* (1921).

LITCHFIELD, ELECTUS DARWIN (1872-). An American architect, born in New York City. He was graduated from the Brooklyn Polytechnic Institute in 1889 and from the Stevens Institute of Technology in 1892. He began his professional work with Carrère and Hastings in New York and was afterwards associated with several other architectural firms in that city. In 1919, he was a member of the firm of Electus D. Litchfield and Rogers. He designed the United States Post Office and Court House in Denver; the St. Paul Public Library; the James J. Hill Reference Library in St. Paul; and many important buildings in Washington, Brooklyn and other cities. He was architect and town planner for Yorkship

Village, a permanent industrial town of 1700 houses built during the War for the Emergency Fleet Corporation and the New York Shipbuilding Company. He was a member of several architectural and other societies.

LITERATURE. See FRENCH LITERATURE; ITALIAN LITERATURE; GERMAN LITERATURE; HUNGARIAN LITERATURE; RUSSIAN LITERATURE; ROMANIAN LITERATURE; SPANISH LITERATURE; SCANDINAVIAN LITERATURE; SLAVONIC LITERATURE; and LITERATURE, ENGLISH AND AMERICAN.

LITERATURE, ENGLISH AND AMERICAN. Any survey of the literature of the last decade must necessarily largely be made in terms of the War. For so profoundly has the fact of conflict conditioned the course of events that even in those fields where its influence has been least direct it has radically altered the background of thought as well as of life. A part of the literature of both England and America deliberately eschewed the War; yet it was inevitably of it. Nevertheless the striking thing that becomes apparent in looking back over the years 1914-24 is that the stream of letters, stirred to the depths as it has been by the period of strife, has followed since the inception and the conclusion of the struggle the direction in which it was setting when it broke. The contest stimulated the revolt which was under way against established conventions of thought and action; it crystallized discontent, fructified emotion, and unfettered expression; but it marks no watershed in literary annals. Its immediate effect, indeed, was rather repressive than submersive, and its results to the present have been rather to nurture seriousness than to transform letters.

The first result of the War, both in England and America, was enormously to increase the output of books which constitute what may be termed the fringes of literature. An amazing avidity of interest in the background of the conflict, and in the psychology of the belligerents, made itself manifest almost as soon as the German hosts began to roll into Belgium, and coincidentally with the issuance of the official explanations of the fighting nations began to appear the vanguard of that army of publications which as the contest developed ranged from inquiry into its causes to description of the manner and incidents of its waging. Speculation as to the means of preventing a similar calamity in the future kept pace with the chronicles of battle and drew into the ranks of the exponents and propagandists many of the leading writers of England and America. Among others Kipling, H. G. Wells, Arnold Bennett, Mrs. Humphry Ward, May Sinclair, Gilbert Murray, Viscount Bryce in England; Edith Wharton, Dorothy Canfield, Richard Harding Davis, Winston Churchill, Owen Wister, Gilbert Parker in America turned their pens to the services of the Allies. Valuable as may have been their work in the developing and sustaining of morale and in familiarizing the public with current international doctrine, from the standpoint of literature it was negligible. Indeed, accurate and animated as was much of the writing of the various phases of the War it was in great part of ephemeral importance. Such books as G. Lowes Dickinson's *The European Anarchy*, Arthur Bullard's *The Diplomacy of the Great War*, Max Eastman's *Understanding Germany*, Bertrand Russell's *Justice in War Time*, Josiah

Royce's *The Hope of the Great Community*, Roland G. Usher's *Pan-Germanism*, and William Stearns Davis's *The Roots of the War*, had wide attention upon publication but they have already passed into the oblivion of topical literature. So too have the multiplicity of volumes recording the impressions of travelers in war-beleaguered Europe, works such as Carl Schreiner's *The Iron Ration*, Madeleine Z. Doty's *Short Rations*, Winston Churchill's *A Traveler in War Time*, Ernesta D. Bullitt's *An Uncensored Diary*, Daniel T. Curtin's *The Land of Deepening Shadow*, Frances W. Huard's *My Home in the Field of Honor*, and Stephen Graham's *Russia in 1916*.

Simultaneously with these more detached discussions came a flood of personal narratives, correspondence from the trenches, chronicles of battle on land, on sea and in the air. Notable in this grist was that mass of soldiers' letters that derived so moving a quality from the idealism that tempered their grim chronicle. At their best, as in the letters of Victor Chapman, Alan Seeger, Rupert Brooke, or Donald Hankey, these volumes that embodied the reactions of youth at grips with the realities of war had an impressive eloquence. Face to face with death, Anglo-Saxon manhood apparently sloughed off the inhibitions and reticences of normal life, and discovered an unsuspected ability to express emotion and experience with clarity and force. Short-lived as was their appeal, any survey of the literature of the war period must take account of these epistles from the trenches.

From the battlefields, too, came the practiced narratives of the war correspondents and official observers, vivid chronicles, which, whatever their limitations of scope, had the virtue of first-hand testimony. In one case at least, that of Masafeld's *Gallipoli*, an imagination capable of conveying the epic nature of the drama unfolding before it transmuted a recital of events into stirring literature. And in H. W. Nevins's *The Dardanelles Campaign*, Philip Gibbs's *The Battles of the Somme*, and the reports of Richard Harding Davis and Frederic Palmer, there was sufficient of literary effectiveness to attach to them a degree of permanence.

It is, however, to other sources to which we must look for the war literature that will be history. So long as the conflict was in progress the necessities of the situation imposed an obligation to silence. But the conclusion of peace released the pens of the diplomats, and lifted the embargo on the utterances of military leaders. From the United States in 1918 came Brand Whitlock's *Belgium*, one of the notable books produced by the conflict, a work of importance historically and possessing no little literary quality. Vivid and revealing as it was, the outstanding diplomatic memoir of the war period was not, however, the Belgian ambassador's but *The Life and Letters of Walter Hines Page*, by Burton Hendrick, a collection of letters impressive for their recital of Anglo-American relations during the war epoch and for the mellow personality and grace of style that invested their record with abiding interest. Together with these reminiscences may be placed as of lesser but nevertheless high interest Ambassador Gerard's *My Four Years in Germany* and *Face to Face with Kaiserism*, Ambassador Morgenthau's *Story*, Lewis D. Einstein's *Inside Constantinople*, and Hugh Gibson's *A Journal from Our Legation in Belgium*.

Close upon the end of the conflict the military leaders entered the literary lists, some of them to combat criticism, others merely to tell the story of their experiences. Viscount French, Sir Frederick Maurice, Julian Corbett, Admiral Jellicoe, Field-Marshal Haig, Commander Belaire, Admiral Fisher, Admiral Sims, Sir Ian Hamilton and others of their associates on land and sea published narratives that must hold permanent place as history. Supplementing these more personal chronicles, and of hardly less value as source books of the future, appeared a stream of books of which some of the most notable were Winston Churchill's *The World Crisis*; *The Economic and Social History of the War*, edited by James T. Shotwell; Charles Seymour's *A Diplomatic Background of the War*, and Woodrow Wilson and the World War; Charles G. Dawes's *A Journal of the Great War*; H. W. V. Temperley's *A History of the Peace Conference at Paris*, Ray Stannard Baker's *Woodrow Wilson and the World Settlement*; and Robert Lansing's *The Peace Negotiations, a Personal Narrative*. Definitive histories of the War it is too soon to expect, but several preliminary treatises presenting panoramic surveys of the contest have made their appearance. Such are Nelson's *History of the War*, by John Buchan; Buchan's *History of the Great War*; Conan Doyle's *History of the Great War*, and Frank Simonds's *The Great War*.

The War while giving rise to a vivid curiosity as to the period immediately antecedent to its outbreak at the same time directed attention to the more distant past. Specialized fields of interest came suddenly to the fore as when the doctrine of self-determination brought the smaller nationalities into prominence, or discussion of a League of Nations threw emphasis on earlier experiments in restraint of war. On the other hand, the entire pageant of history assumed a new significance, and subjected to painstaking research, was made to yield fresh import as its data were interpreted not as by the older historians, through the medium of personal or national prejudice, but with the detachment of scientific investigation. Ancient times as well as modern were tapped at their sources, with the result that the last 10 years have seen a steadily growing body of authoritative history. The important series of Cambridge histories—the *Cambridge Medieval History*, the *Cambridge History of Modern Times*, the *Cambridge History of India*, the series entitled *The Legacy of Greece and Rome and Our Debt to Greece and Rome*, the *Chronicles of America*, edited by Allan Johnson; *The Second Empire*, by Philip Guedalla; *The Evolution of Parliament*, by A. F. Pollard; *The Age of the Reformation*, by Preserved Smith; *Modern Democracies*, by Viscount Bryce; *The History of the United States since the Civil War*, by Ellis Paxson Oberholtzer; *The McKinley and Roosevelt Administrations*, by James Ford Rhodes; *The Declaration of Independence*, by Carl Becker; *The History of Modern Europe*, by G. P. Gooch; *The Beginnings of New England and Revolutionary New England*, by James Truslow Adams; *The Supreme Court in United States History*, by Charles Warren; *The Conquest of New Granada*, by R. B. Cunningham Graham—these are a few works representative of the range and character of historical research during the decade.

That in an age of specialization, and at a

period when history more uniformly than ever before had become categorical and documentary, the "outline" should spring to such wide popularity as it attained in the past decade in H. G. Wells's *The Outline of History*, Hendrik Van Loon's *The History of Mankind*, and the books in related fields that followed their fashion, may at first glance seem an anomaly. Yet it is in truth but the logical result of the scientific development of historical study. For history has grown too complex in the light of contemporary research, and in its conjunction with economic, social and environmental factors to be followed by any but the scholar in detail. The outline, with its swift portrayal of the march of mankind from primitive beginnings to the highly organized society of to-day, provides the means to that bird's-eye view of human history which is a minimum essential to the understanding of the present; and when invested with the dramatic quality which the daring of a Wells bestowed upon it, the success of the epitome of history is easily comprehensible.

If history has flourished during the past decade biography has had a no less robust development. More than any field of literature except fiction it has responded to the interest in the new psychology which has been the dominant preoccupation of the last few years. Biographical writing has advanced far indeed from its old conception of a life as a mere succession of incidents to the analysis of such a book as Van Wyck Brooks's *The Ordeal of Mark Twain*. Under the handling of writers who like Mr. Brooks, Lytton Strachey, and Gamaliel Bradford apply though in differing fashion and degree the psychological method to career and personality it has become rather than chronicle an essay in interpretation. As a result it has gained in brilliance and suggestiveness and grown in favor but it has laid itself open to the charge of eccentricity when written by the less scientific and to the danger of being considered an argument to a thesis even when practiced by the ablest of its exponents. Mr. Strachey, whose *Eminent Victorians* and *Queen Victoria* have not only brought biography but almost the Victorian age into favor, applies impressionism to an epoch as well as to personalities, while Mr. Bradford in *American Portraits* and *Damaged Souls* uses a psychological as Mr. Brooks does a psychoanalytical method in his characterization. As a result, biography as it is being written to-day by its most brilliant popular exponents represents not detached description and appraisal but an evaluation in which the personality of the author inevitably fastens its stamp upon that of the hero.

Curiously enough in a period which began in violent reaction against its philosophy and practice, much of the biographical writing of the past 10 years has dealt with the Victorian era. Victorian gods might be dethroned but their shadow was still mighty in the land. From the painstaking research of Monypenny and Buckle's monumental *Life of Disraeli* and the informed chronicle of Lady Gwendolen Cecil's *Life of Robert Marquis of Salisbury* to the audacious egotistries of Margot Asquith: *An Autobiography*, Victorian reminiscence has run the gamut of politics and the arts. Government and diplomacy have found spirited reflection in such works as *The Private Diaries of the Rt. Hon. Sir Algernon West*, edited by Horace G. Hutchinson; the *Diaries of Wilfrid Scaven*

Blunt; The Letters of Lord and Lady Wolseley, edited by Sir George Arthur; Lady Paget's *Embassies of Other Days*; A. G. Gardiner's *The Life of Sir William Haecourt*; Lord Frederic Hamilton's *The Day before Yesterday*; Sir Harry Johnston's *The Story of My Life*; and Kathleen Fitzpatrick's *Lady Henry Somerset*. Literature and art were represented in biographical or autobiographical form in *Unpublished Letters of Matthew Arnold*, by Arnold Whtridge (a book written and originally published in America); *Carlyle till Marriage*, by David Alec Wilson; *Letters of Thomas Carlyle to John Stuart Mill, John Sterling and Robert Browning*, edited by Alec Carlyle; *Thackeray and His Daughter*, edited by Hester Thackeray Ritchie; *The Life of Mrs. Humphry Ward*, by Janet Penrose Trevelyan; W. S. Gilbert's *His Life and Letters*, by Sidney Dark and Rowland Grey; *Changes and Chances*, by H. W. Nevins; *The Adventure of Living*, by J. St. Loe Strachey; *My Life and Some Letters*, by Mrs. Patrick Campbell; *Letters and Papers of John Addington Symonds*, edited by Horatio F. Brown; *John Ruskin's Letters to William Ward*; and W. H. Mallock's *Reminiscences*. Mr. Mallock's volume, a disappointing revelation of stagnation in mental outlook, presents an interest out of all proportion to its actual merits through its reflection of the persistence into the very maelstrom of the war years of a philosophy of politics and society untempered by the progress of events. By contrast the *Recollections* of Viscount Morley, one of the outstanding biographies of the past 10 years both from the standpoint of literature and that of contemporary history, is all the more notable for ripeness of spirit and spacious mental outlook.

American personal history during the past decade has in some of its most important expression been autobiographical. Close to the opening of the period, Thayer's *Life and Letters of John Hay* wove into a rich pattern public achievement and literary accomplishment, furnishing interesting commentary on contemporary political annals. Few biographies of recent years have equaled in interest from the point of view of psychology *The Education of Henry Adams*, a remarkable human document, in which the author depicts the play of quintessentially New England influences upon a sensitive nature. Like the life of Hay and *The Education of Henry Adams*, the volumes of letters by William and Henry James constitute permanent contributions to literature, the one portraying a mind of widest philosophic scope, sturdy in its Americanism, and the other a personality finding fulfillment possible only outside of its native land, but for all its overlay of cosmopolitanism essentially of it. Racy of the American background, though in widely variant fashion, are Hamlin Garland's *A Son of the Middle Border*, and *A Daughter of the Middle Border*, with their vivid depiction of pioneer life; Theodore Dreiser's *A Book about Myself*; Theodore Roosevelt's *Letters to His Children*; Robert Underwood Johnson's *Remembered Yesterdays*; M. T. Werner's *Barnum*, the record of a career unthinkable outside of America; Royal Cortissoz's *Life of Whitelaw Reid*; Henry Watterson's recollections; Kate Douglas Wiggin's *My Garden of Memories*; the life of E. H. Harriman; *The Americanization of Edward Bok* and Michael I. Pupin's *From Immigrant to Inventor*. Political biography added

to its credit during the past decade Joseph Bucklin Bishop's *Life of Roosevelt*; the authorized biography of Grover Cleveland, by Robert McElroy; *Samuel Adams, Promoter of the American Revolution*, by Ralph Volney Harlow; *The Life of Roger Brooke Taney, Chief Justice of the United States Supreme Court*, by Bernard C. Steiner, and Beveridge's exhaustive life of Chief Justice Marshall, indispensable to the student of his period.

Perhaps of all forms of literature the essay most demands for its fertilization the quiet and contemplative mind. War, and the aftermath of war in radical thought and propaganda, were little conducive to armchair philosophy, and the dearth of outstanding work in the field of the essay during the greater part of the decade is easily explicable in view of the prevailing turmoil. Both in England and America, however, the essay and the essay in criticism have increasingly been coming into their own in the past few years. In the United States, indeed, criticism has had a development which is one of the most striking features of contemporary American literature. Never before in this country has there been so widespread a public for critical writing, or so many organs devoted partially or predominantly to its uses. Stuart P. Sherman, Paul Elmer More, H. L. Mencken, Henry S. Canby, Carl Van Doren, Van Wyck Brooks, and a goodly fellowship of able if less noted critics have produced works of genuine distinction. If a greater urbanity still marks the work of the English critics a compensatory eagerness may be placed to the credit of the American.

The decade of 1914-24 was, except for the development of its fiction, most striking for its renaissance of interest in poetry, and in poetry, as in fiction, it has been the American contribution which has been of peculiar interest. When the War broke out in 1914, it found America riding on the crest of a wave of poetical experimentation, which derived primarily from France, but which struck its roots deep into American soil, and drew from it sinews and strength. Free verse, as the new poetry was termed, and as it was expounded by Amy Lowell, and practiced by Edgar Lee Masters, Carl Sandburg, Vachel Lindsay and other of its serious exponents, is "a verse form based on cadence." It eliminates the recurrent rhythm of the line, and regards the group of lines as the unit of verse. It claims thereby to attain a flexibility and compass impossible to poetry in traditional meters; "free verse," says Miss Lowell, "within its own law of cadence has no absolute rules: it would not be 'free' if it had." Nor has it regard for the restrictions imposed in the past on the content of poetry. It holds to a belief in "exteriority" or "objectivity," rejecting the traditional abstractions of poetry for the concrete and the scientifically accurate. And it strives to convey its meaning through a clear-cut imagery which in the hands of an essential classicist like H. D. or an artist with the craftsmanship of Miss Lowell produces poetry of genuine beauty and in those of a Carl Sandburg or an Edgar Lee Masters verse of rugged power. But free verse has not been consistently at ease in the house of its friends; it has been torn and tortured by the wilder experimenters like Kreymer and Pound, and it has been the excuse for the entrance into the lists of poetry of numbers of persons whose only qualification

for its writing is the ability to shuffle off conventional forms. Nevertheless it has been a vigorously fruitifying force in American literature, and though it is safe to say that a reaction has set in at present against it, there is no doubt that it has to its credit not only new and valuable metrical achievements but the sudden outcropping of magazines of verse and poetical criticism that have both reflected and stimulated the growth of interest in poetry.

That the Imagist precision of diction and sharpness of impression are capable of attainment without sacrifice of traditional metrical forms, the work of Edwin Arlington Robinson, by many critics adjudged the greatest contemporary American poet, and of Robert Frost abundantly prove Robinson's ironical and analytical intelligence, playing upon rustic characters and scenes has produced poetry of highly realistic power in his portrayal of New England life. His method, however, which is indirect, and the frequently difficult texture of his thought, have prevented his works from capturing the popular fancy as did the grim realism of Edgar Lee Masters's epitaphs in the *Spoon River Anthology*. Robert Frost, on the other hand, who wraps the commonplaces of New England life in a kindly irony, has won popular favor as well as critical approval with *North of Boston* and *Mountain Interval*. And Miss Lowell herself, *vers librist*, imagist, and originator of what she has termed polyphonic prose, has shown herself competent to produce as admirable effects in conventional meters as in the new. Most of the American poets of standing, Conrad Aiken, Witter Bynner, William Rose Penet, Stephen Benet, Louis Untermeyer, to mention but a few, have written at times in free verse, though perhaps their best expression is found in the old forms. An interesting experimenter of different sort has been Vachel Lindsay, who first in the *Congo and Other Poems* and later in other interesting narrative poems, attempted to approximate his lyrics to a chant, employing various typographical devices to develop his effects.

In 1924 some of the most, if not the most distinguished poetical work was being done by two women who only within the past few years had come to the fore, Elinor Wylie, whose *Nets to Catch the Wind* and *Black Armor* have been followed by a novel, *Jennifer Lorn*, as striking in execution as her verse, and Edna St. Vincent Millay whose *Second April*, *Renascence*, *Harpy Weaver* and *Figs from Thistles* all have no less fine an art than her Elizabethan play. Miss Millay's strength lies in the abundant lyric beauty of her lines, in a sort of naïveté combined with passion, and in a technical proficiency that cloaks the cleverness of its performance in the ease of its accomplishment. Mrs. Wylie's work has remarkable precision and chastity of outline, perfection of form and brilliance of execution, an emotion that, as one of her critics has said, "burns with cold fire," and more depth of thought than Miss Millay displays. Theirs is on the whole the most promising talent of the day.

The English poets have in the main been less influenced by the new verse forms than their American fellows, and have correspondingly less sought their subjects in the commonplaces of life. Imagism under the influence of the transplanted Americans, H. D., Ezra Pound, and

T S Eliot, has been productive of interesting results, and in the case of H. D. of its most perfect expression. But in England as in America a reaction against it is under way.

English poetry has more than American sought its interest in narrative themes, having achieved in the work of John Masefield probably the most significant poetic output of the Anglo-Saxon world during the decade. The sea and the English countryside have engaged Masefield's efforts, and an intense concern for man at his coarsest and most humble has lent an imaginative and moving quality to verse of often noble diction. Had he survived, Rupert Brooke, whose war sonnets gave evidence of growing beauty and power, might have written his name large in the annals of English poetry. The War, indeed, developed a notable output of verse, the most able of its exponents being James Elroy Flecker, "the last of the Parnassians," Robert Graves, Robert Nichols, Wilfrid Owen, Siegfried Sassoon, Edmund Blunden, Isaac Rosenberg, and Richard Aldington. In striking contrast to the bitter mood of the war period is the pastoral character of the work that men like Graves and Blunden are doing to-day. The lyric tradition of British poetry has further been carried on by Wilfrid Wilson Gibson, John Drinkwater, Ralph Hodgson, and Walter de la Mare. Hardy, Bridges and Kipling have continued to write and A. E. Housman in *Last Poems*, published 28 years after his previous volume of verse, *A Shropshire Lad*, has added a permanent contribution to the poetical literature of England. At the other extreme from these poets stand the Sitwells, the representatives of the most revolutionary poetical doctrine.

Interesting as has been the course of poetry during the past decade the developments in fiction have held the centre of the stage. And in fiction as in poetry it is in America that the most striking evolution has taken place. The War found the English realists in command of the field and the post-war period has seen the continuance of their sway. Sex, and more latterly psychology, have supplanted the interest in social problems and injustices which were so dominantly the preoccupation of the closing period of the Victorian era and the opening years of the twentieth century; yet such writers as H. G. Wells and John Galsworthy still continue the sociological tradition. Wells, with his exuberant fancy, his perennial zeal for reform, his distinguished didacticism, and his daring in applying scientific doctrine to romance, has produced a series of novels which like the plays of the no less ardent moralist, Bernard Shaw, are the vehicle for the promulgation of the author's social and spiritual gospel. *Mr. Britling Sees It Through*, the most successful war novel of the Anglo-Saxon world, no less than *Joan and Peter* or *The Secret Places of the Heart* revealed Mr. Wells himself. Mr. Galsworthy's preoccupation has remained predominantly social, even where as in his war novel, *Saint's Progress*, he has become immersed in an emotional situation. In his *Forsyte Saga*, an analysis of the possessive instinct as exemplified in an English family, both his art and his social outlook have found expression in a series of novels that take rank with Arnold Bennett's studies of the English countryside as among the most notable contributions to Anglo-Saxon fiction of the century. From *Old Wives' Tales* to

Riceyman's Steps, despite several insignificant novels, Bennett's realism has translated the commonplace from dullness to dignity by lifting it to the plane of the universal and thereby investing it with poignance lacking to such work, for instance, as the quiet annals of Archibald Marshall.

If social relationships have continued primarily to interest certain of the English novelists it is the pastures of the soul that have captured the interest of more of them. J. D. Beresford, May Sinclair, Compton Mackenzie, Rebecca West, Frank Swinnerton, Dorothy Richardson, Sheila Kaye-Smith, H. G. Wells, Aldous Huxley have all set themselves to its exploration with the result that the psychological novel, now frequently the psychoanalytical novel, has become the most conspicuous type in English fiction to-day. In such novels as May Sinclair's *Mr Waddington of Wyck*, Rebecca West's *The Return of the Soldier*, Sheila Kaye-Smith's *Joanna Godden*, or H. G. Wells's *Secret Places of the Heart* it differentiates itself sharply from the specifically sex novel as written by George Moore and in its extremest form exemplified by D. H. Lawrence, while in the work of an author like Aldous Huxley it becomes naturalism. A remarkable example of the psychological novel is to be found in James Joyce's *Ulysses*, the hundreds of pages of which chronicle the stream of consciousness as it passes through one man's mind over a period of 24 hours. Various considered a work of genius and a dull abnormality it is at least important in its influence on the development of expressionism.

The largest figure of contemporary English fiction was undoubtedly Joseph Conrad whose novels of the sea and adventure draw their deepest interest not from their incident but from their splendid projection of the conflict of human emotions under the play of forces extraneous to themselves as well as inherent. It is a noble psychology which Conrad has outlined, moving, pregnant and touched by a profound compassion, presented in rich and virile manner, and transfused by a high imagination. Work of the last few years that stands out by reason of its singular subtlety is that of *The Garden Party* and *The Dove's Nest*, by Katherine Mansfield, whose delicate art was ripening into fuller achievement at the moment of her untimely death. In their ability to suggest the shifting play of mood and feeling, and their clear-sighted understanding of human reactions, her short stories gave promise of a genuinely high talent.

Despite the predominance of the interest in psychology, the purely romantic and the fantastic still hold their own in English fiction. In the case of Walter de la Mare, a gifted and richly endowed poetic fancy in combination with broad human sympathy have produced in *The Memoirs of a Midget* a work which, easily capable of grotesquerie, is in actuality a tender and convincing characterization. So too in David Garnett's *Lady into Fox* and *A Man in the Zoo*, the improbable and the fantastic are welded into harmony with a conceivable reality through a singularly unified conception and execution. Like the fantastic tale the novel of manners has continued to hold place in England, having found particular popularity in the work of Rose Macaulay whose *Potterisms* and *Dangerous Ages* have skillfully held up to view a type of contemporary Briton whose muddled

thought and sentimentality the War brought into prominence.

Noteworthy as a large part of British fiction during the past decade has been, and distinguished as its craftsmanship, on the whole the English novel has been flat in comparison with the American. For in America, forces that were stirring before the War, and that were brought to full growth in the heat of battle, have resulted in a literature of revolt remarkable alike for its vigor and its vehemence. Within the last decade American fiction has left off its swaddling clothes and arrived at maturity. A generation after the influence of Zolaism has passed in France and England it has arrived at naturalism. It no longer acquiescently accepts the world, and especially its particular corner of it, at its own valuation, but it has taken to investigating it for itself scientifically; and great has been its disillusionment. What formerly it deemed fair it now has discovered to be at bottom ugly and binding. The ease of American life it reads as stultification, its uniformity as desperate monotony, and its complaisance as promise of disaster. It has set itself to the high task of saving America from itself by joining battle with the dullness, the restrictions, the narrowness of its life. Especially against the village has it turned the power of its attack. And in its efforts to come to grips with realities it has introduced into American literature an acerbity completely foreign to its past. Sinclair Lewis's *Main Street* and *Babbitt*; Sherwood Anderson's *Winesburg, Ohio*, and *Poor White*; Zona Gale's *Miss Lulu Bett*; Floyd Dell's *Moon-Calf* burn with a passion of indignation. They are tracts as much as novels—tracts against monotony, against convention, against rigid social codes. Their propagandism is their limitation as well as their strength. Embittered by the same sudden awareness of the uglinesses of life are the works of the writers of the more extreme expressionist school, Evelyn Brown, Carl Van Vechten, Waldo Frank, Ben Hecht and a group of lesser novelists whose concentration on the abnormalities of life converts their fiction into pathology. No less a challenge to existing conditions is the attitude of the "younger generation" to whom Scott Fitzgerald's *This Side of Paradise* set a model for depicting the breakdown of decorum and convention, and Dos Passos's *Three Soldiers* established a norm for frank speaking.

Side by side with the naturalistic movement has continued a milder realistic stream. Booth Tarkington; Edith Wharton, whose *Age of Innocence* with its acid delineation of a New York that had not yet acquired self-consciousness confirmed her position in the forefront of American novelists, Joseph Hergesheimer, Willa Cather, whose delineation of American life displayed its nature without the social criticism implicit in the work of Sinclair Lewis; Dorothy Canfield; Fannie Hurst; Robert Herrick, Charles G. Norris have proved virility and closeness to life of fiction in America. Playing on another plane is the unique talent of James Branch Cabell, whose theory that art should be based on a dream of life as it should be and not as it is, and that it must therefore tend "to become more or less of an allegory," has resulted in a richly tapestried series of romances of the Middle Ages and of present-day Virginia. A very genuine gift for fiction showed itself in Elinor Wylie's *Jennifer Lorn*, a "sedate ex-

travaganza" that sustains the manner and style of the eighteenth century with amazing success throughout its fantastic course.

Despite the seriousness which has become the most marked characteristic of American fiction, and despite its absorption in the commonplace, the story of mystery, of adventure, the society novel, and the love story pure and simple continue to flourish. Both in England and America there has been an amazing output of mystery and detective tales, and in both countries trash of the first order attains to best-sellerdom.

Briefly to summarize, Anglo-Saxon fiction while it has produced no masterpiece has shown a sturdy development and a constantly closer approximation to the problems and interests of everyday life. In America the trend to naturalism and on both sides of the ocean the application of the findings of science and especially of the new psychology to the interpretation of life have been the outstanding developments of the period. While the British novelists have displayed a surer and more accomplished craftsmanship the Americans have shown more ruggedness and intensity and a more bitter attack upon the strongholds of custom.

In drama the notable fact has been the passing of the closet play, and the concern with the interests and problems of the day. Bernard Shaw has remained the outstanding satirist and moralist of his time, while Galsworthy has continued to use the stage as a means for protest against social abuses and injustices. Barrie, Lord Dunsany and Lady Gregory have produced work of delightful whimsy and fancy, while Drinkwater with his *Abraham Lincoln*, Clemence Dane with her *Will Shakespeare*, and Bernard Shaw with *Saint Joan* have brought the historical play into favor. Shaw's amazing *tour de force*, *Back to Methuselah*, should have special mention. In the opinion of many critics the most considerable dramatic work of the decade in America has been that of Eugene O'Neill. For discussion of the drama in detail see the article THEATRE.

It is interesting to note that economic and social science has much advanced in public interest under the handling of such writers as Graham Wallas, R. H. Tawney, John Maynard Keynes and other writers whose scientific accuracy is in no way impaired by their ability to write for the lay intelligence. Their work, however, falls without the scope of an article on literature.

In concluding a survey of the decade begun by the War, attention must be drawn to the increase of interest in foreign literature which followed in the wake of the conflict. International-mindedness indeed is one of the most strongly marked trends of the period. The fiction of Spain, Scandinavia, Holland, and Russia as well as that of France and lately of Germany has been translated and widely read. The criticism and art discussion of foreign lands has had broad currency, and the war memoirs and older biographies of the European nations have taken place beside similar chronicles in the English tongue. America, at least, has broadened its horizons in a decade as never before in a century and in that fact, as well as in its sudden waking to self-realization, lies rich augury of future achievement.

LITHOPONE. See CHEMISTRY; ZINC.

LITHUANIA. One of the new Succession States, created out of the former Russian Em-

pire after the War. The claims of the Lithuanian government included: the whole of the former Russian province of Kovno; the province of Vilna, minus the districts of Disna and Vileika; a part of the province of Grodno north of the Niemen River; the province of Suvalki; part of the province of Courland; the Memel District. According to 1914 figures, this territory had an area of 151,491 square kilometres (59,633 square miles) and 4,800,000 inhabitants. The eastern frontier was defined in the Russo-Lithuanian Treaty of July 12, 1920; the fixing of the northern frontier was provided for in a convention with Latvia on Sept. 28, 1920, by which the line was to be laid down by an English arbiter. To the south, however, no agreement was reached by 1924 (see below). Both Poland and Lithuania laid claim to part of the province of Suvalki, the province of Vilna, and Grodno province. The actual area under the control of the Lithuanian government was only 33,000 square miles, and the population (1923 estimate) 2,011,200 of which 86.7 per cent was rural. Ethnographical Lithuania, i.e. the territory included in the claims of the government, was comprised of 73.5 per cent Lithuanians, 12 per cent Jews, 4.3 per cent Poles, 2.5 per cent White Russians, 1.5 per cent each Germans and Russians. Vilna, the capital, claimed by Lithuania, had in 1914, a population of 214,600; other large towns were: Kovno, the seat of government (92,000), Grodno (61,600), Memel (32,000), Suvalki (21,240), Shavli (21,240). These towns were in both political and ethnographical Lithuania.

Religion and Education. In the most important provinces, Vilna, Kovno, and Suvalki, Roman Catholics formed 75 per cent of the population, Jews 12 per cent, Greek Orthodox 9 per cent, Protestants 4 per cent. In 1922, there were 1708 primary schools with 160,230 pupils and 93 secondary schools with 17,149 pupils. In 1922, the University of Kovno was opened with 25 professors and 800 students.

Industry and Trade. The population was preponderantly rural in character. Of the total area it was computed that 45.8 per cent was arable land, 24.3 per cent meadow land, 20.3 per cent forest, and the rest unproductive and waste. In 1923, 540,800 hectares were under winter rye and 76,000 hectares under winter wheat. Principal crops in 1922 yielded, in metric tons: rye, 535,000; oats, 264,000; barley, 146,000; wheat, 78,000; potatoes, 1,386,000; flax, etc., 42,000. In 1923 there were 505,500 horses, 1,285,000 cattle, 1,413,000 sheep, and 1,897,000 pigs. Poultry farming and bee keeping were also important. Forests cover 2,065,000 acres of which 889,600 were owned by the state. By the treaty with Russia, Lithuania received 247,000 hectares of forests as compensation for damages. The leading internal question was the distribution of the large landed estates and by 1922 it was evident that expropriation was to be the plan adopted, without compensation. The agrarian law of February, 1922, provided for the expropriation of all holdings in excess of 80 hectares. The want of capital and the unsettled condition of Central Europe made the reversion to an exclusive agricultural economy the only means for the maintenance of an ordered national life. The government applied itself to this purpose, adopting the following measures: the teaching of the principles of scientific agriculture, the replenish-

ment of the herds, the increasing of the arable area, in order to make possible greater export of agricultural products. These plans were meeting with success, for by 1920-21, 10 per cent of the barley, rye, and wheat, half of the flax, and a good deal of the poultry, were exported.

Immediately after the War there was no revival of industry, the destruction caused by belligerent armies and the lack of raw materials together with the dismantling of the larger plants being insuperable obstacles in the way of a resumption of activities. What commercial intercourse there was partook of the nature of an exchange of agricultural products for finished manufactured articles. The trade for 1922 and 1923 was:

	1922	1923
Exports	\$7,690,000	\$14,680,000
Imports	7,490,000	15,660,000

Chief exports were: corn, cattle, hams, dairy products, flax, linseed, timber, hides, and wool. Chief imports were: manufactured articles, agricultural machinery, fertilizers. In 1923, almost all the imports (82 per cent) came from Germany; England supplied 5 per cent; United States 2 per cent. Principal countries of destination of exports were Germany, 43 per cent; England, 27 per cent; Latvia, 16 per cent.

Communications. There were only about 930 miles of road in the whole country. There were 1995 miles of railway, including Memel, in 1923. The most important lines were: The Wirballen-Kovno-Koszedari line; the Janov-Shavli; the Koszedari-Jewie. Also 117 miles of waterway were navigable for steamboats, and 433 miles for smaller craft. The most important, the Niemen River, was internationalized by the Treaty of Versailles. See MEMEL.

Finance. In 1921 the revenues were 672,582,658 Lithuanian marks and the expenditures 885,725,375 marks. For 1922, the budget estimates balanced at 4,312,280,089 marks (roughly, \$7,000,000). For 1923 revenues exceeded expenditures, which totaled \$19,860,000. Up to 1923, the depressions of the German mark seriously affected the Lithuanian currency because much of the discounting business was done in Germany. On Oct. 1, 1922, a new currency law provided for the creation of a national currency based on the gold standard, with the *lit* (equal to one-tenth of the American gold dollar) as unit. Paper currency in circulation on Dec. 31, 1923, totaled 60,074,300 lits (\$6,007,430); backed by gold reserve of 16,446,200 lits; silver in circulation was 254,800 lits, and foreign currencies 46,521,800 lits. The Lithuanian foreign debt, in 1923, was put at \$7,000,000.

Government. After working for two years, a constituent assembly finally promulgated a constitution on Aug. 1, 1922. This provided for a nationally elected diet (*Seim*), chosen every three years on the basis of universal suffrage and the proportional system, to make the laws, ratify treaties, approve the budget, and choose the state president. The ministry was to be selected by the president but was to be held responsible to the diet. Cultural autonomy was provided for national minorities, viz., Jews, White Russians, and Poles, and religion and education were to be unhampered. The economic clauses provided for state regulation of lands and estates; state insurance for

the aged, infirm, and unemployed; freedom of organization, and the right to strike. Up to the first national election (Oct. 10, 1922), the government was in the hands of a Christian Democrat-National Socialist bloc, representing the peasants, and the opposition was made up of the Social Democrat and Polish parties. The first election returned 78 members grouped as follows: 38 Christian Democrats, 19 National Socialists, 11 Social Democrats, 3 Jews, 2 Poles, 5 Communists. The first president was A. Stulginskis, president of the constituent assembly, who was appointed Dec. 21, 1922. The government was formed by a clerical-agrarian combination, which continued in power after the May election of 1923.

History. The policy of Russianization that characterized imperial rule in Lithuania during the nineteenth century was maintained in the twentieth century, even though in 1905, a Lithuanian National Assembly was called in session during the Revolution. It was not until 1915 that the Russian grip was broken, to be replaced (unfortunately) by the German. From 1915 to 1919 a German army held the land and the exploitation of its resources and scrapping of its factories did much to impoverish the country for years to come. The policy of the Germans aimed at eventual annexation, the erection of a Lithuanian State Council in 1917 was tolerated and Lithuanian independence was nominally recognized by Germany in March, 1918, but a German monarch, Prince von Urach of Württemberg, was nominated as the future king, the German administration was maintained, and the German army stayed on in the country until late in 1919, living off the land and pillaging at will, having the weak provisional government at its mercy. The outcome of the War, however, put an end to these intrigues. Bolshevik forces now succeeded the German and fighting was sporadic throughout the whole of 1919. In January, 1919, a conference of Lithuanian patriots reestablished the *Tariba*, or National Council, which had been formed in 1917, organized a cabinet, and proclaimed a provisional government. This government, however, was driven from Vilna, its capital, to Kovno, which in turn was soon threatened by Bolshevik invaders. At the same time the Bermondts branch of Von der Goltz's mercenaries had to be beaten off, while Polish troops were continually being engaged in 1919-20. By the spring of 1920 the situation had improved to such an extent that a constituent assembly could be convened, to reiterate the declaration of independence, begin work on a constitution, and open negotiations with Russia. The first ray of hope for the young nation appeared in July, 1920, when Russia came to terms with its succession state on a remarkably liberal basis. Lithuania was freed of its share of the Russian state debt; was compensated with 3,000,000 gold rubles; received 100,000 hectares of forest land; and had its ethnographic frontiers recognized, including the right to Vilna and Grodno.

The Polish difficulty could not be terminated so easily. Vilna was occupied by a free-lance Polish army in October, 1920, with the result that recourse had to be taken to the League of Nations (q.v.). Though the Polish government disavowed the raid, the insurgent army could not be dislodged and it was necessary late in 1920 to dispatch an international force into

Lithuania to end the conflict. Nothing was accomplished and it was not until November, 1921, that the rebel leader, Zeligowski, voluntarily withdrew. Throughout 1921, 1922, 1923, all attempts to adjudicate the Vilna controversy were fruitless. The plebiscite plan first broached by the League of Nations had to be abandoned in 1921 in favor of direct negotiations between Lithuania and Poland, and these proving unsuccessful, was adopted again. Finally on Jan. 8, 1922, an election was held in the Vilna district and the diet thus chosen decided on February 20, by a vote of 96 to 6, for union with Poland. Lithuania refused to accept the result on the ground of irregularities and in this was upheld by the League of Nations Council. But on July 18, Vilna was incorporated into the Polish nation, and the League of Nations, accepting the *fait accompli*, appointed a commission to fix the boundary line. On Mar. 16, 1923, the Council of Ambassadors, in laying out the eastern and northern Polish boundaries, included the Vilna district, despite the still strenuous objections of the Lithuanian government. In 1924, hostile forces still confronted each other on the disputed frontier. In its attempt to acquire the Memel district (910 square miles), formerly belonging to Germany, as its only outlet to the Baltic Sea, Lithuania was likewise thwarted for a time. By the Treaty of Versailles, the district north of the Memel River, including the port of Memel, was turned over to an Allied commission presumably in trust for Lithuania. In 1922, a movement for a free state, encouraged by Poland, was under way with the result that the French in charge refused to cede the district to Lithuania. It was not until Feb. 16, 1923, after a show of arms, that Lithuania received Memel on condition that Poland be permitted to use the port (see MEMEL).

On Sept. 21, 1921, Lithuania was admitted to the League of Nations. On Mar. 23, 1918, it had received *de jure* recognition by Germany; on July 12, 1920 by Russia; and on Dec. 20, 1922, by the Great Powers. A commercial treaty was signed with Great Britain in May, 1922, and with Germany in June, 1923. The latter also contained political provisions which pointed toward a closer understanding.

LITTLE, ARTHUR W. (1873-). An American printer and publisher, born in New York City. He was educated in private schools and in 1891 joined the company of his father, J. J. Little & Company, printers. He served in the State Guard in New York from 1891 to 1912. In the War he served in France with the 369th United States Infantry, colored, as regimental adjutant and major, and took part in all actions with Gouraud's 4th Army. He was wounded in action Sept. 12, 1918. He was made a Chevalier of the Legion of Honor and received four Croix de Guerre.

LITTLE ENTENTE. The series of agreements and treaties entered into by Czechoslovakia, Jugo-Slavia, Rumania, and on occasions Poland, for the protection of their mutual interests, was commonly called the Little Entente. It was ostensibly an alliance for defensive purposes in case of an unprovoked attack from Hungary, but in reality it embodied an all-embracing policy aiming at the maintenance of the status quo on the European continent resulting from the Peace Treaties of Versailles, St. Germain, and the Trianon. Since

the precarious national existence of the Central European Succession States was part of the settlement attempted in these treaties and was an outgrowth of the French desire for security, the Little Entente may with justice be regarded as having begun with the Peace Conference and as being part and parcel of the French continental policy. In her desire for security, France became at the Peace Conference the sponsor of the most extreme claims of the Czechs, the Poles, the Serbs, and the Rumanians, in order to make the new states formed by these peoples as strong as possible and to create out of them a bloc as France's ally against Germany. Hence the new states were given contiguous frontiers and direct railroad communications and practically no regard was shown for the wishes and the economic necessities of the inhabitants of the border districts. The Succession States, on the other hand, when they found themselves so generously endowed, were quite ready to fall in line. The more territory they acquired, the greater became their desire for more, and they treated their alien minorities as harshly, if not more harshly, than they themselves had been treated before by their German, Magyar, or Russian masters. More flagrant even than the violation of ethnical principles was the disregard shown for economic considerations. The economic unity which was the most plausible justification for Austria-Hungary's existence was destroyed by the treaties primarily because the Allies wished to block Germany's penetration into the East. The disruption of economic intercourse with the German network of ports, rivers, canals, railroads, etc., of which they were the natural hinterland, left the Succession States economically hanging in the air. The result of the settlement was thus a patchwork of new states saddled with alien minorities counting many millions and faced with political unrest and economic chaos. This being the situation, security for France and the Succession States lay only in the closest cooperation toward a continuation and consolidation of the existing status by military effort. The only means of accomplishing this was the formation of a "cordon sanitaire" of the new states around Germany, to prevent the rise of the Germans and the Magyars and their union with Russia. In pursuit of this aim France set out to strengthen these states as far as possible by granting them generous loans toward the building up of powerful armies, disproportionate to their size and true interests, and by missing no opportunity of supporting their excessive territorial demands at the expense of Germany and her potential friends. Most important to France in this respect was Poland, because its interposition between Germany and Russia destined it to be the bulwark in the "cordon sanitaire."

The most essential prerequisite for the success of this policy was the conclusion of a definite alliance between the Succession States based on community of interests and the cooperation of this compact group with the French policy. On Aug. 13, 1920, a convention was signed between Czecho-Slovakia and Jugo-Slavia which provided for mutual help in case of unprovoked attack. When the efficacy of this alliance for the maintenance of the status quo had been sufficiently demonstrated on the occasion of the prevention of the restoration of Emperor Charles to the throne of Hungary, Rumania joined on Apr. 23,

1921. The immediate concern of this tripartite defensive alliance or Little Entente was the consolidation of its position, which was successfully carried out during the following years. Its intervention frustrated, in September, 1921, a second Habsburg Putsch in Hungary, and it coöperated with France in blocking the union of Austria with Germany. By means of a coercive policy, Austria and Hungary were subsequently compelled to submit in every respect to the wishes of the Little Entente and to seek a closer accord with it. Thus a frontier incident between Hungary and Rumania in January, 1923, brought about a partial mobilization of the Little Entente, in the face of which Hungary was powerless. Similarly, in seeking a loan abroad Hungary had to comply with the conditions laid down by the Little Entente at the Sinaia Conference in July, 1923. While Austria was also coerced into dependence on the Little Entente, open union with the latter as a way out of the difficulties besetting the little republic was vetoed by Italy, which objected to a strengthening of the influence of France and the Little Entente on her northern frontier. The Italians were not without justification in sensing in the formation of the Little Entente a veiled threat against their interests in Central Europe and the Adriatic. Although some of the difficulties between the Little Entente and Italy were subsequently ironed out by the Treaty of Rapallo between Italy and Jugo-Slavia and by the Fiume settlement of Jan. 27, 1924, it remained an open question, in 1924, how far these and other pacts had actually removed the deep-rooted friction between the Little Entente and Italy. Absolute accord seemed impossible as long as the Little Entente remained the guardian of French interests. Poland never joined the Little Entente officially. She did, however, on all important matters cooperate with the latter to an extent which made her an unofficial fourth member of the alliance. In accordance with an agreement reached at the Belgrade Conference in March, 1922, Poland, Czecho-Slovakia, Jugo-Slavia, and Rumania operated as a quadruple alliance at the Genoa Conference. This bond was further cemented at the Prague Conference on Aug. 27-28, 1922, by a further agreement as to community of action. Within the years 1922-24 this union of interest and action between Poland and the other three Succession States grew, if anything, more firm. The position of the Little Entente became more consolidated with each successive year through conferences and treaties between the individual members and an ever-progressing understanding with France. France's system of binding these states to her policy by rendering them military, financial, and diplomatic assistance reaped its greatest success in the conclusion of the Franco-Czech Alliance on Dec. 27, 1923 (signed Jan. 25, 1924). By this treaty the two countries pledged themselves to render each other military assistance in case of an unprovoked attack by a third party and to guarantee the full execution of the Peace Treaties. In substance this amounted to a military alliance in favor of the maintenance of the territorial status quo and of the domination of Central Europe by France and the Little Entente, and as such it aroused grave apprehension and adverse criticism in Italy and Germany. At the Belgrade Conference of the Little Entente the extension of this treaty to include the other

members of the Little Entente was under discussion, and while no definite action was taken then, such a step, in the summer of 1924, appeared to be more than a possibility. See CZECHO-SLOVAKIA; FRANCE; ITALY; JUGOSLAVIA; POLAND; RUMANIA.

LITTLETON, MARTIN WILIE (1872-). An American lawyer, born in Tennessee. He was self educated and after studying law was admitted to the bar in 1891. For several years he practiced in Dallas, Texas, and then removed to New York, where he at once took a prominent place in legal circles. Becoming active in politics, he was assistant district attorney of Kings County from 1900 to 1904, and president of Brooklyn Borough in 1904-05. He served as delegate from New York to the Democratic National Convention in 1904 and presented the name of Alton B. Parker for President. From 1911 to 1913, he was a member of Congress for New York.

LIVE STOCK. The live stock situation during the decade following 1914 was somewhat unstable. Prior to the War there was an increasing tendency toward a reduction in the per capita consumption and production of meat in the United States and in the world in general. The War, however, acted as a great stimulus to meat production in the United States. At first the effects of rising feed prices tended to start a temporary liquidation of animals in 1915 and 1916, but as the world's shortage of meat became evident, prices of meat animals increased. As early as 1913 the dwindling per capita production of meat also stimulated production in the more remote and thinly populated areas of the world where previous evidence had indicated that beef production might thrive. Consequently the United States packers began to establish plants in South America. The calculated per capita consumption in the United States of meats including lard was 154 pounds in 1914, dropping as low as 143 pounds in 1917 and rising in 1922 to 164 and in 1923 to 183 pounds. The greatest portion of this increase was due to an increase of 33 pounds in the per capita consumption of pork. The increased demands for meats and the high prices offered caused many light cattle to be slaughtered during 1917 and 1918, thus tending to reduce the total amounts of meat produced. In order to assure a good price for meat animals during the encouragement of meat production in the United States during the War, several conferences were held under the direction of the United States Food Administrator and the Secretary of Agriculture relating to the profits to be expected by packers and to the relative prices of corn and pork. Although no prices were guaranteed as the result of these conferences, plans were adopted for licensing the packers and seeing that their profits should not exceed 25 per cent of the sales. It was also suggested that beginning in 1917 an effort would be made to maintain the price of hogs per 100 pounds at 13 times the price of corn per bushel. Under these plans, the United States Department of Agriculture in cooperation with the State agricultural colleges endeavored to increase pig production about 15 per cent during 1918. These efforts met with much success.

The peak of meat prices was reached in 1919 with practically all classes of animals, and live stock producers were enjoying a more prosperous position probably than ever before, although

a severe drought in the Southwest ending in 1918 and followed by one in the Northwest tended to handicap feeders and breeders alike in those sections. Following the prosperous conditions of 1919 there was an irregular decline in both pork and beef prices during 1920, choice and prime beef dropping from \$19.25 per 100 pounds at the first part of the year to \$13 at the end of the year. Hogs advanced to \$18.25 on September 25, followed by a sharp decline to an average of \$8.97 on Dec. 15, 1919. The situation was, therefore, very critical for beef and hog producers, but the outlook for the sheep breeder was even more demoralizing. Wool dropped from \$0.72 on the range to a condition where no market at all existed. The prices of live stock continued to fall through 1921, reaching low levels at the end of the year. Although the European countries were still suffering from the loss of many of their animals during the War, they were unable, due to poor exchange rates and a lack of credit facilities, to purchase any great amounts of meat. At the end of 1921, however, conditions began to show more promise, and some meat products, especially pork, were exported to western Europe. Conditions in 1922 were somewhat better, especially for the sheep raiser, and the passage of the McCumber-Fordney Tariff bill placed a heavy duty on all mutton, lamb, and wool imported. During 1923 a peculiar situation existed which apparently was unexpected, resulting in an unprecedented slaughtering of hogs and a reduction of hog prices to low levels of less than \$7 per 100 pounds in December. The following table indicates the annual fluctuations in the numbers of animals slaughtered under Federal inspection in the United States, and the estimated total slaughtering based on the 1909 and 1919 Census reports.

The supervision of the packers and stockyards agencies during the War finally resulted in the passage of the Packers and Stockyards Act by Congress, which became a law in August, 1921. This act provided for the supervision of public stockyards, live stock market agencies, and dealers in live stock and live stock products, to prevent misleading or illegitimate practices and to encourage fair competition. Some of the operations of the packers and stockyards administration under the direction of the Secretary of Agriculture were severely criticized by several of the large packers from the commencement of the operation of the law, making it necessary to establish legally the constitutionality of the act, and next to secure the right to inspect the books of certain of the packers who refused permission for it.

International Conditions. Many changes occurred in the live stock situation in the different countries of the world between 1914 and 1924. The beef industry had developed rapidly in Argentina, New Zealand, Australia, and South Africa. New Zealand and Australia also became the world's largest exporters of lamb and mutton. The development in these countries was rendered possible by the rapid improvements in methods of refrigeration and cold storage of meat products and by the opening of large slaughtering plants. Much of the Australian and New Zealand products was shipped to England and Europe, though considerable New Zealand lamb coming to the United States prior to and after the War met with much favor. The extreme depression in the beef cattle mar-

LIVE STOCK

ket which began in 1921 and continued through 1923 was keenly felt in several of the beef exporting countries. In Argentina where cattle raising for export is the main industry, the situation became so acute in 1923 that the cattlemen organized and were instrumental in having a law passed on October 15 to set a minimum price for beef in the export trade. The fallacy of such a procedure was evident when the law began to operate and the British and American packing companies in Argentina refused to buy cattle. This resulted in a situation more serious than before the law was passed, and in a little more than three weeks the government suspended the operation of the law for six months, and the purchase of meat for export was resumed but at a lower price than one month before. For the relief of similar situations in Australia and South Africa, the respective governments offered bounties on export beef of $\frac{1}{4}$ d. (\$.005) and $\frac{1}{2}$ d. (\$.01) per pound. Bounties were also offered for live cattle exported.

Canadian stock raisers were somewhat affected by the United States tariff bills and by the raising of the embargo on Canadian cattle by Great Britain in 1923. Most significant in the meat export trade of the United States was the reaction to the European demand for meat during the War. In 1916 and 1919 the exports of both beef and pork reached the largest amounts in history, although the United States has long been the leading exporter of pork. In 1914 less than 400,000,000 pounds of pork products, exclusive of lard, were exported, but this amount was more than doubled in 1915, with gradual increases in 1916 and 1917, and a large increase in 1918 to nearly 1,750,000,000 pounds. The exports in 1919 were over that figure, but in 1920 they were only about one-half of this amount and gradually declined to a little over 700,000,000 in 1922, with an increase to 900,000,000 in 1923.

The major part of the pork exported consisted of bacon, which was over 1,000,000,000 pounds in both 1918 and 1919. Over 50 per cent of the bacon and about 75 per cent of the ham and shoulder exports were to the United Kingdom. The lard exports were close to 500,000,000 pounds up to 1919, when they reached 750,000,000. This amount was maintained through 1922, but 1923 saw a further increase to over 1,000,000,000 pounds. The exportation of lard to Germany, which was entirely stopped from 1915 to 1918, was resumed in 1919, with gradual increases in the amount exported each year to nearly 377,000,000 pounds in 1923. In 1913 the amounts of lard exported to the United Kingdom and Germany were nearly equal, but this condition did not again exist until 1920, though in the years following, large amounts were shipped to each country. The amount sent to Germany was very heavy, showing an increase about 50 per cent, in 1923.

There was also a remarkable increase in the fresh beef exports of the United States during the decade, from less than 7,000,000 pounds in 1913 to 514,000,000 in 1918, with a gradual decline to 3,000,000 pounds in both 1922 and 1923. Canned beef exports were similarly increased. A major part of the exports of fresh beef and about one-third of the canned beef were to the United Kingdom.

Research. Experimental inquiry indicated a more complete realization of the importance

of fundamental research. Notable advances were made in the physiology of nutrition and knowledge of qualities which influence the value of feeding stuffs. A better understanding of the importance of vitamins, minerals, and the different kinds of proteins in the rations of live stock tended to explain why certain feeds and feed combinations produced unsatisfactory growth or gains. During and succeeding the War the high prices of feeding stuffs made the utilization of fibrous and other low grade feeds desirable, and much work was done, especially in Germany, toward increasing the digestibility of such feeds by hydrolysis. The attainment of results in breeding experiments with the live stock of more economic importance is necessarily a slow process, and the expense of such investigations is often prohibitive. Much progress in breeding has been made through the use of the smaller experimental animals such as the rat and the guinea pig, with sufficient comparisons with larger animals to make it evident that the same fundamental principles of inheritance are operative.

Fundamental investigations of much practical value on the effect of inbreeding in rats and inbreeding and crossbreeding in guinea pigs were carried on at the Wistar Institute and the United States Department of Agriculture, respectively. Both studies indicated that inbreeding tends to increase the percentage of homozygosity of the stock. The latter study dealing with the effect on fertility and vigor showed that such conditions seem to depend mainly on dominant factors and that crossbreeding brings together a greater variety of dominant factors and thus results in increased vigor. The fundamental work in animal breeding has been closely correlated with the results of breeding investigations with the fruit fly, *Drosophila melanogaster*, which species has been better analyzed genetically than any other organism.

Interesting studies of sex determination in animals have indicated that sex is not only due to differences in the sex determining power of chromosomes, but that the sex may also be modified by other factors which tend toward the production of intersexuality in certain cases. R. Goldschmidt in Germany, working with gipsy moths, has carried this analogy further than other investigators, although recent results with goats, chickens, and pigs in Scotland and the United States have partially, at least, corroborated his results. Theoretical studies of growth, senescence, and production in dairy cattle and hens have indicated that the curves of milk production, egg production, and growth and senescence in dairy cattle and senescence in fowls tend to follow the course of a monomolecular chemical reaction. It is thus concluded that these physiological operations are limited by chemical reactions. See VETERINARY MEDICINES.

LIVONIA. See BALTIC PROVINCES.

LLOYD GEORGE, DAVID. A British statesman and reformer (see VOL. XIV). At the outbreak of the War, as Chancellor of the Exchequer, he took measures which enabled British credit to withstand, with success, the immediate needs brought about by the beginning of the struggle. Early in 1914, he was appointed Minister of Munitions, in which office he displayed remarkable ability for organization and ceaseless energy. Following the death of Earl Kitchener, in 1916, he was appointed

Secretary of State for War. He proposed the limiting of the cabinet to a smaller membership, from which the prime minister was to be excluded. After failure of his attempts to bring this about, he resigned, and as he was supported by the Unionist leaders, Mr Asquith, Prime Minister, retired, and Lloyd George became Minister and First Lord of the Admiralty. From 1917, to the conclusion of peace, he was practical dictator of government policies. Following the Armistice, he called for a general election, and was returned to power by an immense majority. He was one of the leading figures at the Peace Conference and showed remarkable diplomatic skill. In 1920, he introduced the Home Rule Bill, and largely through his efforts the Irish Free State was established. In 1921, he took an active part in many conferences on the political and social conditions in Europe. His aggressive support of Greece in 1922, and the success of the Turkish armies in that year, brought about his defeat, together with that of the Coalition Cabinet. He was, however, returned to Parliament and remained leader of the Liberal policy in the House of Commons. He visited the United States in 1923. See GREAT BRITAIN, *History*.

LOANS, INTERNAL AND EXTERNAL. See FINANCE AND BANKING.

LOCKWOOD, CHARLES CLAPP (1877-). An American lawyer, born in Brooklyn, N. Y. He was graduated from the New York Law School in 1900, and in 1903 was admitted to the bar. He served in the New York Assembly in 1914 and in the State Senate from 1915 to 1922. He was prominent in reform movements in the city and State and was chairman of the Senate Committee to investigate rents, housing and combination in restraint of trade. He was also chairman of the commission to investigate the finances of the City of New York.

LODGE, HENRY CABOT (1850-1924). An American legislator and historical writer (see VOL. XIV). He was reelected to the Senate in 1916. In the same year he served as chairman of the Committee on Resolutions at the Republican National Convention in Chicago. He was the leader in the Senate in opposition to the Versailles Treaty and the covenant of the League of Nations in the form in which they were presented for ratification. He proposed reservations and amendments which President Wilson refused to accept (see UNITED STATES). He served as temporary and permanent chairman of the Republican National Convention of 1920, and in the same year was chairman of the United States Pilgrim Tercentenary Commission. In the 67th and 68th Congresses, he was chairman of the Committee on Foreign Relations and was the Republican leader of the Senate. He was appointed, by President Harding, delegate and special ambassador to the Conference on the Limitation of Armaments, 1921-22. In 1922, he was again reelected to the Senate, though by a greatly reduced majority. His opposition to several of the important policies advocated by President Coolidge in 1924 caused him to be severely criticized. His later books include *Democracy of the Constitution and Other Essays* (1915); *War Addresses* (1917).

LODGE, SIR OLIVER JOSEPH (1851-). A British philosopher and man of science (see VOL. XIV). In 1919, he was made Albert Medallist of the Royal Society of Arts as a

pioneer in wireless telegraphy. His publications after the War were devoted exclusively to psychical research, a cause which found greater favor in the eyes of the British public than ever before. *Raymond*, published in 1916, purports to reveal communications between Sir Oliver and his son who was killed in the War. *Christopher* (1919) is a study in human personality on the spiritistic hypothesis. In addition to these publications, Sir Oliver was active as an experimenter in psychical phenomena and contributed a number of articles to journals devoted to that cause.

LOEB, JACQUES (1859-1924). An American physiologist and experimental biologist (see Vol. XIV). Dr. Loeb's death occurred unexpectedly at Bermuda, where, as was his custom, he had gone to conduct experiments with marine life. During the past decade he had published the following major works: *The Organism as a Whole, from the Physicochemical Viewpoint* (1916); *Forced Movements, Tropisms and Animal Conduct* (1918), and *Proteins and the Theory of Colloidal Behavior* (1922).

LOEB CLASSICAL LIBRARY. See PHILOLOGY, CLASSICAL.

LOENING, GROVER C. (1874-). An American aeronautical engineer born in Bremen, Germany. He was educated in New York. He is best known for his many inventions, the first flying boat; monoplane flying boat, and first American short hull flying boat. At San Diego (1914) he invented the first monoplane rigid bracing pursuit machine. In 1915, he built the Signal Corps tractor used by Lt. B. Q. Jones in establishing the world's three passenger endurance records and by Lt. T. Dodd in the cross country record. He introduced steel construction in the Sturtevant biplane (1916) and the next year began the designing and development of the Loening monoplane and seaplane. In 1922, the Collier Trophy was awarded him for the Loening Air-Yacht. Among his books are: *Monoplanes and Biplanes* (1917); *Military Aeroplanes* (9th ed., 1916-18); *Revival of the Monoplane* and many papers and articles.

LOGUE, MICHAEL (1840-1924). A Roman Catholic cardinal, born in Donegal, Ireland. He was consecrated Bishop of Rapoe in 1879 and coadjutor, and in 1887 was made Roman Catholic Primate of all Ireland. He was created Archbishop of Armagh in 1888 and Cardinal in 1893. He took an active part in bringing about settlement between the opposing parties in Ireland prior to the formation of the Irish Free State, and his influence was constantly exerted against violence and bloodshed.

LONDON CONFERENCES. See REPARATIONS.

LONDON, TREATY OF (1915-). See FIUME-ADRIATIC CONTROVERSY; ITALY; REPARATIONS; TIROL, GERMAN SOUTH; WORLD WAR, DIPLOMACY OF.

LONE SCOUTS OF AMERICA. An organization for boys, incorporated in Washington in 1915. It offers boys the advantages of the Boy Scout Movement without the necessity of joining a group of boys in the same neighborhood. Up to Aug. 1, 1924, 527,353 boys were enrolled. The Lone Scouts, with no adult leadership except that of two officials at the Long House, or national headquarters, who edited and published the official organ, developed complete national organization. Sixteen districts were created, each with a Council Chief and a Council of Ten.

The Council Chiefs constituted a national executive committee. Forty authorized Lone Scout amateur publications were edited and published by Lone Scouts who, in most cases, did the printing themselves. Local, State and National rallies were conducted. On Mar. 1, 1924, the Lone Scouts of America merged with the Boy Scouts of America (q.v.) without losing its separate identity, the national officials of the Boy Scouts of America becoming the national officials of the Lone Scout organization. The *Lone Scout*, the official magazine, was discontinued at the same time, and *Boy's Life*, the Boy Scout magazine, became the official magazine for the Lone Scouts. The Long House is at 500 North Dearborn Street, Chicago.

LONGFELLOW, ALEXANDER WADSWORTH (1854-). An American architect, born at Portland, Me. He was graduated from Harvard in 1886 and studied architecture at the Massachusetts Institute of Technology and at the Ecole des Beaux Arts. He began the practice of his profession in Pittsburgh and Boston in 1887, forming the firm of Longfellow, Alden and Harlow. This firm designed the Carnegie Library at Pittsburgh and the City Hall at Cambridge. In 1895, he formed a partnership with his brother, R. K. Longfellow. He designed Phillips Brooks House and other buildings for Harvard University and several buildings for Radcliffe College. He was the designer of the original Boston elevated railway stations. His memberships included that in the Art Commission of Boston and the Boston Marine Museum. He was a trustee of the Boston Museum of Fine Arts, a Fellow of the American Institute of Architects, and a member of other architectural and patriotic societies.

LONGLEY, HARRY SHERMAN (1868-). An American Protestant Episcopal bishop, born at Cohoes, N. Y. He was graduated from St. Stephen's College in 1891 and from the General Theological Seminary in 1894. He was ordained priest in 1895 and served as rector in churches in Massachusetts, New York and Illinois. In 1912, he was consecrated suffragan Bishop of Iowa. He was elected coadjutor bishop in 1917, and in 1920, became presiding bishop of the Province of the Northwest.

LONGMAN, (MARY) EVELYN BEATRICE (1874-). An American sculptor (see Vol. XIV). Among her awards during the period were the French gold medal from the Art Institute of Chicago, 1920; the Widener gold medal from the Pennsylvania Academy of Fine Arts, 1921; and the Watrous gold medal from the National Academy of Design, 1923. She became a member of the National Academy in 1919.

LONG RANGE GUNS. See ARTILLERY.

LONGWORTH, NICHOLAS (1869-). An American public official, born at Cincinnati, Ohio, and educated at Harvard. He was admitted to the bar in 1894, and served in the State Legislature of Ohio from 1899 to 1903. In 1903, he was elected to the United States Congress and was reelected for 10 consecutive terms. He was floor leader of the House of Representatives. In 1906, he married Alice, daughter of Theodore Roosevelt.

LORD, ROBERT HOWARD (1885-). An American educator, born at Plano, Ill. He was graduated from Harvard University in 1906 and took postgraduate courses in Austria, Germany and Russia. He was successively instructor in

history and assistant professor of history at Harvard, occupying the last post from 1916. In 1918-19, he was Harvard Technical Expert on Polish affairs with the American Commission to Negotiate Peace in Paris, and a member of the American Inter-Allied Commission to Poland (1919). He wrote *The Second Partition of Poland* (1915), and, with Professor C. H. Haskins, *Some Problems of the Peace Conference* (1920).

LORENZ, ADOLF (1854-). An Austrian orthopedic surgeon (see VOL XIV) who has received unusual publicity in the United States and elsewhere, because identified with a successful method of bloodless treatment for a special deformity—congenital dislocation of the hip. At the close of the War, Lorenz removed to the United States, although dividing his practice between the latter and his home city of Vienna. His free orthopedic clinics held in some of the large cities of the United States caused a difference of opinion among the profession of the latter, but the claim of his partisans has been that the public needs education as to what may be accomplished among cripples by orthopedists.

LORENZEN, ERNEST GUSTAV (1876-). An American lawyer and educator, born at Russee-Kiel, Germany. He came to the United States in 1892 and studied law at Cornell University, taking postgraduate studies in France and Germany. After practicing law in New York City from 1901 to 1903, he was appointed professor of law at the University of Maine. In 1904, he became professor of law and in 1910, dean of the Law School at George Washington University. From 1911 to 1914 he was professor of law at the University of Wisconsin, and from 1914 to 1917 at the University of Minnesota. In the latter year, he was appointed to the same chair at Yale. He was the author of several books on legal subjects, and contributed articles to American and European reviews.

LOBING, WILLIAM JOSEPH (1869-). An American mining engineer, born in San Mateo County, Cal. He began his career as a boy in a mine in California in 1881 and after successively passing through the stages of milling practice, he became (1894) mill superintendent of the Utica Milling Company. In 1906, he was made general manager of Benick, Moreing and Company's Australasian interests, consisting of 41 mining companies with headquarters in London. Eight years later he returned to California and became president and general manager of six or more gold-mining corporations. He presided over the American Mining Congress in 1921-22.

LOS ANGELES. The largest city of California. The population rose from 319,198 in 1910 to 576,673 in 1920, an increase of more than 80 per cent in 10 years, and to 666,853 by estimate of the Bureau of the Census for 1923. During 1922 and 1923, \$6,900,000 was spent by the city on harbor improvement, and Los Angeles became a regular port of call for 61 different freight and passenger liners and five tank liners. Imports increased from \$1,942,647 in 1910 to \$9,897,336 in 1920 and to \$33,555,593 in 1923, while exports climbed even more remarkably from \$135,911 in 1910 to \$18,606,121 in 1920 and to \$29,495,005 in 1923. In 1924, bonds were voted by the city for the following purposes: \$34,600,000 for school sites, buildings and equipment, \$8,000,000 for water

works, \$1,600,000 for police stations and signal system, \$1,000,000 for bridges, \$600,000 for incinerators, and \$400,000 for fire boats; \$35,000,000 additional for flood control was voted by the county. Municipal power houses were built in 1916 and 1919, and an extension in 1923, which all together produced 107,000 horse power of electrical energy. The value of oil refineries rose from \$1,145,812 in 1914 to \$5,613,897 in 1919; the value of petroleum products in 1923 was \$135,271,425. Bank clearings increased from \$1,145,167,110 in 1914 to \$7,024,888,783 in 1923 and to \$3,713,429,255 the first six months of 1924; and building permits from \$21,684,100 in 1910 to \$200,133,181 in 1923, and to \$78,828,738 the first six months of 1924.

A new city charter was adopted in May, 1924. The outstanding characteristics were the enlisting of citizen service on a great number of administrative boards, with boards of expert administrators attached; and the large administrative powers given to responsible executives subject to these citizen boards. The mayor, the city attorney, controller, members of the council and of the board of education were elected by popular vote. Sixteen departments each administered by five paid commissioners were created. Provision was also made for the creation of boroughs within the city, whereby any annexed section not a part of the original central city of 4000 acres, or of 40,000 population, might become a borough by action of the city council and a vote of the residents of the proposed borough territory.

LOTI, PIERRE (JULIEN VIAUD) (1850-1923). A French novelist (see VOL XIV). In 1914, he reentered the service of his country, being appointed to the General Staff of the Armies of the East as inspector of the defense against airplanes. Resulting from his war experiences were numerous articles, published in the following collections: *La Hyène Enragée* (1916); *Quelques Aspects du Vertige Mondial* (1917); *L'Horreur Allemande* (1918); *La Mort de Notre Chère France en Orient* (1920). The last-named book pleads the cause of Turkey. During these latter years he also published several autobiographical works, continuations of his earlier ones: *Prime jeunesse* (1919), *Un Jeune officier pauvre* (1923), and *Suprêmes visions d'Orient* (1922). The two last works were revised and published by his son Samuel. He died at Hendaye and was buried at Saint-Pierre-d'Oléron, the "cradle of his family."

LOUCHEUR, LOUIS (1872-). A French industrialist and politician, born at Roubaix, and educated at the lycée of Lille and at the Ecole Polytechnique in Paris. Graduating as engineer, he was interested in industrial enterprises, but did not come to the fore until the War when he became Minister of Munitions. After the Armistice, he was made minister for the devastated regions. He tried to bring French and German industrialists together on programme of mutual interest, but the plan was for the time being unsuccessful. See REPARATIONS.

LOUDERBACK, GEORGE DAVIS (1874-). An American geologist, born at San Francisco, Cal. He studied at the university of California and received his Ph.D. there in 1900. He became professor of geology at the University of Nevada in 1903. In 1906, he returned to California, where during 1917-1920 he was professor of geology and in 1920, dean of the college of

letters and science. During 1914-15 he was consulting engineer of the Standard Oil Geological Expedition to China and in 1918-19 he held consulting relations with the United States Bureau of Mines and the United States Geological Survey. During the War he was a member of the Pacific Coast committee on geology of the National Research Council. Dr. Louderback made a specialty of the basin range structure and West Coast stratigraphy and was the discoverer of several new minerals, including benitoite. He was president of the Seismological Society of America in 1914.

LOUIS III, LEOPOLD JOSEF MARIA ALOYS ALFRED, last KING OF BAVARIA (1845-) (See Vol. XIV.) He was forced to abdicate in November, 1918, when the people of Bavaria inaugurated the Bavarian Free State.

LOUISIANA. Louisiana is the thirtieth State in size (48,506 square miles), and the 22d in population; capital, Baton Rouge. The population increased from 1,656,388 in 1910 to 1,798,509 in 1920, a gain of 8.6 per cent. The white population increased from 941,086 to 1,096,611, the native white increasing from 889,304 to 1,051,740, while the foreign-born white decreased from 51,782 to 44,871. The number of negroes fell from 713,874 in 1910 to 700,257 in 1920. Both urban and rural populations increased: the former from 496,516 to 628,163; the latter from 1,159,872 to 1,170,346. The growth of the principal cities was as follows: New Orleans (q.v.), 339,075 (1910), 387,219 (1920); Shreveport, 28,015 to 43,874; Baton Rouge, 14,897 to 21,782.

Agriculture. Agricultural conditions in Louisiana in the decade 1910-20 were affected, as in the case of the other southern States, by the ravages of the boll weevil, which became serious about 1905. The effect is apparent in the following comparison of the acreage and production of cotton for various years during the period. In 1904, the acreage was 1,745,865 and the production 1,089,526 bales; in 1908, 1,550,000 and 470,136 bales; in 1913, 1,244,000 and 440,000 bales; in 1917, 1,454,000 and 639,000 bales; in 1919, 1,527,000 and 298,000 bales; in 1921, 1,168,000 and 279,000 bales; and in 1922, 1,185,000, and 357,000 bales. The estimated production in 1923 was 340,000 bales. In addition to the devastations of the boll weevil, army worms in many sections of the State stripped the leaves of the cotton plant. Damage in 1923 from the boll weevil and leafworm was heavier than in 1922. See **BOLL WEEVIL** and **COTTON**.

While the population of the State increased 8.6 per cent in the decade 1910-20, the number of farms increased 12.4 per cent (from 120,546 to 135,463). In 1910, the acreage of land in farms was 10,439,481; in 1920, it had decreased to 10,019,822, or 4 per cent. The improved land in farms, however, increased from 5,276,016 to 5,626,226 acres, or 6.6 per cent. The total value of farm property showed an apparent increase, from \$305,220,988 in 1910 to \$589,826,679 in 1920; the average value per farm, from \$2499 to \$4354. In interpreting these values, however, and, indeed, all comparative values in the decade 1914-24, the inflation of currency in the latter part of that period is to be taken into consideration: the index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of

land used for agricultural purposes decreased from 35.9 in 1910 to 34.5 in 1920; the percentage of improved land rose from 50.5 to 56.2. In 1920, of the total of 135,463 farms, 57,254 were operated by owners, 828 by managers, 77,381 by tenants. The comparative figures for 1910 were 52,989, 950, and 66,607. White farmers in 1920 numbered 73,404, compared with 65,667 in 1910; the native white farmers, 71,081, compared with 63,236; Negro farmers, 62,036 compared with 54,819. The 1.9 per cent decrease in Negro population, 1910-20, in contrast with the increase of 9.7 per cent in the preceding decade, quite seriously affected the farm labor situation. The farms free from mortgage in 1920 numbered 36,010, compared with 42,011 in 1910. Those mortgaged numbered 11,783 compared with 9834. The number of dairy cows in 1920 was 217,690, compared with 279,097 in 1910, a decrease of 22 per cent; "beef cows," 316,518, compared with 183,550. The number of swine declined from 1,368,000 in 1910 to 911,600 in 1920. Mules, in 1920, numbered 180,115, compared with 130,928 in 1910; sheep, 129,816 compared with 139,308. The estimated production of the chief farm crops in 1923 was as follows: corn, 26,545,000 bushels; oats, 1,194,000 bushels; potatoes, 1,638,000 bushels, sweet potatoes, 6,802,000 bushels; tobacco, 459,000 pounds; rice, 15,896,000 bushels; peanuts, 9,132,000 bushels. Comparative figures for 1913 are: corn, 41,800,000 bushels, oats, 990,000; rice, 11,760,000, potatoes, 1,750,000; hay, 240,000 tons; tobacco, 270,000 pounds; and cotton, 444,000 bales. Louisiana is the most important cane-sugar producing State. The area planted to sugar cane in 1922 was 217,000 acres, and the crop of cane was 3,342,000 short tons, producing 241,376 short tons of sugar and 20,420,000 gallons of molasses. While the area and production show some fluctuation during the decade, they were practically the same in 1922 as in 1914.

Mining. Louisiana is an important producer of minerals, especially of petroleum, sulphur and natural gas. There is no metal mining in the State. The petroleum industry is most important. Its progress during the decade 1914-24 is indicated by the following comparative figures: in 1914, there were produced 14,309,435 barrels, valued at \$12,886,897; 1915, 18,191,539, \$10,804,653; 1916, 15,248,138, \$14,669,774; 1917, 11,392,201, \$17,224,602; 1918, 16,042,600, \$27,535,060; 1920, 35,714,000, \$112,606,000; 1921, 27,103,000, \$42,469,000; and 1922, 35,376,000. The increased production in the last three years indicates the discovery and development of new oil fields. In production of sulphur, Louisiana heads the list of States. Production figures for the period under review are as follows: 1914, 374,470 tons; 1917, 595,130; 1918, 918,700; 1919, 526,250; 1920, 37,635; 1921, 795,980; and 1922, 1,146,860. The production of natural gas is also of great importance, as indicated by the following figures: 1915, 25,540,392 M. cubic feet; 1918, 36,094,132; 1920, 58,274,000; 1921, 58,004,000. The output of natural gas gasoline has increased steadily, rising from 2,113,159 gallons in 1916, to 7,020,538 gallons in 1918; 10,609,629 gallons in 1920; and 15,340,374 gallons in 1921. In addition to the minerals mentioned above, the State produces clay products, salt, and sand and gravel. The total value of the mineral products in 1921 was \$61,061,974, compared with \$138,745,725 in

1920: \$38,851,509 in 1919, \$54,769,225 in 1918, and \$21,890,025 in 1914.

Manufactures. While Louisiana is not one of the chief manufacturing States, its industrial progress, since 1909, has been great. The six cities in the State with a population of more than 10,000, in 1919 contained 27.6 per cent of the total population and produced 32 per cent of the total value of the manufactured products. In 1909, there were in the State 2516 manufacturing establishments: 2211 in 1914, and 2617 in 1919. Persons engaged in manufacture numbered 86,563, 88,014, and 112,523; and capital invested amounted to \$221,516,398, \$261,635,022, and \$462,209,056 in these years. The value of the products in 1909 amounted to \$233,948,638; in 1914, \$255,312,648; and in 1919, \$676,189,770. The increase in value of the products was due largely to changes in industrial conditions brought about by the War, and therefore cannot be properly used to measure the growth of manufactures during the census period of 1914-19; but the increase shown in number of establishments and number of wage earners clearly indicates a growth in the State's manufacturing activities. The first industry in importance in point of value of products is the refining of sugar. This, in 1909, amounted to \$63,775,000; in 1914, to \$57,948,000, and in 1919, to \$141,843,000. The manufacture of lumber and timber products ranks second; in 1909, such products were valued at \$62,838,000; in 1914, at \$66,656,000, and in 1919, at \$130,521,000. Since 1914, when there were 21 refineries, the refining of petroleum has become one of the great industries of the State. The value of the product in 1919 was \$75,023,726. The manufacture of cotton-seed oil and cake takes fourth place in point of value: in 1909, \$13,085,000; in 1914, \$18,016,000, and in 1919, \$57,162,000. The chief manufacturing cities are New Orleans (q.v.), Shreveport, and Lake Charles. In 1909, there were in New Orleans 848 manufacturing establishments, with a product valued at \$78,794,000; 733 in 1914, with a product of \$69,814,000, and 873 in 1919, with a product of \$182,799,000.

Education. Educational progress in the decade 1914-24 was steady in Louisiana. The Legislature of 1914 passed, among other important measures, a compulsory education law affecting all cities of over 25,000 inhabitants. In 1916, measures were passed authorizing the acceptance of the terms and provisions of the Smith-Hughes bill providing for vocational education. The State colony and training school for feeble-minded was created in 1918. In 1920, parish school boards were authorized to create school districts at any time. The Legislature of 1922 passed an act providing for a State Board of Education and parish school boards, defining their powers and providing for the administration and supervision of the public schools of the State: the board to include 11 members, three appointed by the governor, and eight elected for terms of eight years. In the same year an inclusive compulsory attendance measure was passed, providing for the attendance in school of every child in the State between the ages of 7 and 14; and the Legislature also provided for the promotion of vocational rehabilitation. In 1914 the total enrollment in the schools was 288,972, including both white and colored pupils; in 1921-22, the number enrolled had increased to 390,324; of whom 257,-

727 were white and 132,597 were colored the total enrollment in the elementary white schools was 225,167; and in the secondary white, 32,560. The attendance in the State-approved high schools for white children was 23,433. The total expenditure for current expenses in 1921-22 was \$12,586,110, and the total outlay for all educational purposes was \$25,204,675. The percentage of illiteracy in the State decreased from 31.1 in 1910 to 24.9 in 1920: among the native white, from 16.8 per cent to 13.5; among the foreign-born white, from 23.2 to 22.6; among the colored, from 52.2 to 43.8 per cent.

Finance. See STATE FINANCES.

Political and Other Events. There was much friction in the political history of the State in the decade 1914-24, especially in the latter part, due to the activities of the Ku Klux Klan and attempts to control and regulate members of this body by the Governor and other State authorities. In 1914 elections were held for representatives in Congress only. The Democrats were successful in all districts, except one, where a Progressive candidate was elected. In 1915 over \$4,500,000 was expended in New Orleans in an effort to rid the city of rats in order to prevent the reappearance of the bubonic plague. Elections were held in 1916 for governor and other State officers. R. G. Pleasant, Democratic candidate, was elected. In the presidential voting in this year, President Wilson received 79,875 votes; Charles E. Hughes, 6466. In 1920 elections were held for United States senator, and E. S. Broussard, Democratic candidate, was elected. In the presidential voting of this year, J. M. Cox received 87,354 votes; W. G. Harding, 38,538. On Dec. 21, 1922, the bodies of two men were found in a lake in Morehouse parish. It was alleged that these men had been flogged by members of the Ku Klux Klan and their bodies thrown into the lake. Many persons were arrested, but on March 15, owing to lack of evidence, the grand jury failed to bring indictments against them. On Apr. 13, 1923, the district attorney of Morehouse parish lodged 30 informations against prominent citizens for the alleged participation in the murder of the two men, and on November 5, four members of the Ku Klux Klan were found guilty of "carrying firearms on the premises of another," in connection with the activities of the Klan in Morehouse parish. Elections for representative in Congress were held in April, 1924. Genevieve Clark Thompson, daughter of the late Champ Clark, was a candidate for nomination, but was defeated by J. Zach Spearing, of New Orleans, who was elected. In May, 1924, J. M. Fuqua was inaugurated governor of the State.

Legislation. Among the important acts of the Legislature in the decade 1914-24 are those noted below. In 1916 a State Board of Education was created. In 1918 the Legislature ratified a prohibition amendment and the Federal woman suffrage amendment. Cities were authorized to adopt the commission form of government when their population exceeded 5000. Laws were passed regulating the sale of narcotics, and the child labor laws were also amended. A law requiring instruction in the common schools to be conducted only in the English language was enacted. The Legislature of 1924 enacted a measure prohibiting the wearing of masks by members of secret societies.

LOUISVILLE. The largest city of Kentucky

and the second most populous south of the Ohio and the Potomac Rivers. The population rose from 223,928 in 1910 to 258,500 in 1924, by estimate of the Bureau of the Census. The incorporated area of the city was increased to 25,101 acres by the annexation of Highland Park and Oakdale in 1922. The cities of New Albany, Ind., and Jeffersonville, Ind., with an additional population of 42,000, are immediately across the Ohio River. The assessed valuation of the city increased from \$207,000,000 in 1914 to \$500,000,000 in 1924. In point of value of manufactured products, the city is shown by the Census Bureau to be the most important industrial centre in the South. The value of its manufactured products increased from \$105,223,000 in 1914 to \$204,566,000 in 1919, according to the Census Bureau, and the Louisville Industrial Foundation estimated the value of the city's industrial output at \$311,427,908 in 1923. Bank clearings increased from \$715,731,000 in 1913 to \$1,551,638,237 in 1923. The city is supplied with transportation service by nine trunk-line steam railways, eight inter-urban electric railways, and the Ohio River.

LOUVAIN LIBRARY. A famous institution connected with the University of Louvain in Belgium. In the German invasion of 1914, the university together with its library, which contained 120,000 volumes and 250 incunabula, was ruthlessly destroyed. When Cardinal Mercier, its head, visited the United States in 1919, he was asked of what particular aid Americans could be in the work of Belgian reconstruction; he suggested that the schools, colleges, and universities of the younger and larger country should join in the restoration or rather rebuilding of this monument of the smaller and older land. Under the terms of the Versailles Treaty, a large number of volumes were sent into Belgium from Germany to replace those destroyed. Whitney Warren was the architect of the new building, planned for completion in August, 1925, at a cost of \$1,000,000. For its opening and for the celebration of the five hundredth year since the founding of the university and the eleventh from its destruction, ceremonies were projected which were to be attended by representatives of important institutions of learning of the world. Each of these was to leave its shield or other insignia in the library as a permanent memorial. The war records of the donors of funds were also to be engraved on the columns, keystones, and other parts of the structure.

LOVEJOY, ARTHUR ONCKEN (1873-). An American philosopher (see Vol. XIV). In 1920, he collaborated with a group of other American philosophers in the publication of *Essays on Critical Realism*. The common ground of the authors is the distinction between essence and existence, which is not usually stressed by the so-called naïve realists. During the War, Professor Lovejoy was an active propagandist for liberal ideals. He collaborated with Prof. Albert Bushnell Hart in the publication of a *Handbook for the War for Public Speakers* (1917).

LOVETT, ROBERT MORSE (1870-). An American editor and educator, born in Boston, Mass. He was graduated from Harvard in 1892 and in the same year was assistant in English at that university. He served as assistant professor of English from 1894 to 1904; associate professor from 1904 to 1909,

and from 1909 as full professor at the University of Chicago. From 1903 to 1920, he was dean in the junior college. He was a member of the National Institute of Arts and Letters and was the author of *The History of English Literature*, with W. V. Moody (1902); *Richard Gresham*, a novel (1904); *The First View of English Literature*, with W. V. Moody (1905); *A Winged Victory*, a novel, (1907); *Overdars*, a play (1914). He served as editor of the *Dial* in 1917 and joined the editorial board of the *New Republic* in 1921.

LOVETT, ROBERT SCOTT (1860-). An American railway president (see Vol. XIV). During the War he filled important positions in the management of railroads, and was chosen president (1919) and chairman of the Board of Directors (1920) of the Union Pacific System.

LOWDEN, FRANK ORREN (1861-). An American public official, born in Sunrise City, Minn. He was graduated from the Iowa State University in 1885 and studied law at the Union College of Law in Chicago. He began practice in that city in 1887, continuing until 1906. He took an active part in politics and was a member of the Republican National Committee, from 1904 to 1912. In 1906, he was elected member of Congress and was twice re-elected. In 1917, he was elected Governor of Illinois, serving until 1924. He was one of the prominent candidates of the Republican National Convention in 1920, and in 1924 refused the nomination for Vice President.

LOWELL. A manufacturing city of Massachusetts. The population rose from 106,294 in 1910 to 112,759 in 1920 and to 115,089 by estimate of the Bureau of the Census for 1923. A memorial auditorium costing \$1,000,000 was erected in 1921 in memory of the Lowell men and women who took part in the wars in which the United States has been engaged. In the same year, after 10 years of the commission form of government, the city changed back to the mayor and council form. A \$2,000,000 high school was completed in 1922. The assessed valuation of the city increased from \$87,277,643 in 1913 to \$136,492,851 in 1923. In 1924, there were over 300 manufacturing establishments in the city employing 35,000 persons and paying \$35,000,000 annually in wages.

LOWELL, AMY (1874-1925). An American poet and critic, born at Brookline, Mass., and educated in private schools. In 1917-18 she gave lecture courses at the Brooklyn Institute of Arts and Sciences; in 1921 she was the Francis Bergen Foundation Lecturer at Yale and Marshall Woods lecturer at Brown University. As a champion of free verse as well as one of its foremost writers, her influence in this movement in the United States was of great importance (See LITERATURE, ENGLISH AND AMERICAN). She published works during the decade 1914-24 were *Sword Blades and Poppy Seed* (1914); *Six French Poets* (1915); *Men, Women, and Ghosts* (1916); *Tendencies in Modern American Poetry* (1917); *Can Grande's Castle* (1918); *Pictures of the Floating World* (1919); *Legends* (1921). *Fir-flower Tablets—Poems Translated from the Chinese*, with Florence Ayscough (1921); and *A Critical Fable* (1922).

LOWELL, GUY (1870-1927). An American architect (see Vol. XIV). His design for a new municipal court house in New York was accepted in 1919. From 1917 to 1919, he was

director of the Department of Military Affairs for the American Red Cross in Italy and received several decorations for efficiency and valor from the Italian government. He was the author of various books on architecture.

LOWES, JOHN LIVINGSTON (1867-). An American educator, born at Decatur, Ind. He was graduated from Washington and Jefferson College in 1888 and took postgraduate courses in Germany and at Harvard University. After serving on the faculties of several colleges, he was appointed, in 1909, professor of English at Washington University, St. Louis, serving until 1918. In 1913-14, he was dean of the college, and in 1918 became professor of English at Harvard University. He was Lowell Institute lecturer in 1910 and was the author of *Convention and Revolt in Poetry* (1919). He edited, both alone and with others, several texts on Shakespeare and others.

LOWIE, ROBERT HENRY (1883-). An American anthropologist (see VOL. XIV). His principal works include: *Societies of the Arikara Indians* (1914); *Dances and Societies of the Plains Shoshones* (1915); *Notes on the Social Organization and Customs of the Mandan, Hidatsa and Crow Indians* (1917); *Culture and Ethnology* (1917); *Plains Indian Age Societies* (1917); *Myths and Traditions of the Crow Indians* (1918); *The Matrilineal Complex* (1919); *Primitive Society* (1919); *The Religion of the Crow Indian* (1922); *The Material Culture of the Crow Indians* (1922); *Crow Indian Art* (1922); *Psychology and Anthropology of Races* (1923).

LUBIN, DAVID (1840-1919). American agricultural specialist and merchant. He was for many years in business at Sacramento, Cal., but interested himself in improving the system of marketing agricultural products, promotion of complete and systematic statistical information, and development of rural credits, national marketing, etc. He succeeded in bringing before Congress a proposal for an international convention for the establishment of an International Commerce Commission on merchant marine (the measure passed Sept. 1, 1914); and he also secured the introduction of a measure for improving the Parcel Post service, facilitating direct dealing between producers and consumers (1916). His proposals for the International Institute of Agriculture were embodied in that institution, which has since supplied world crop, import and export reports, etc., and to which he was the American delegate. Mr. Lubin died at Rome, Italy, Jan. 1, 1919. See AGRICULTURE, INTERNATIONAL INSTITUTE OF.

LUCIFERINE, LUCIFEROSE. See PHYSICS.

LUDENDORFF, ERICH (1865-) A Prussian general, born at Kruszevnia, near Posen. He worked out the last great German Army Bill passed by the Reichstag in 1913. All his proposals were adopted with the exception of that concerning three new army corps. On the outbreak of the War he was first sent to the western front, where he took the citadel at Liège. On Aug. 22, 1914, he was sent to the eastern front as chief of the General Staff and shared with Hindenburg the credit of the great victories at Tannenburg and the Masurian Lakes. During the progress of the War his advance was rapid and constant. He organized

the great German offensive of the spring and summer of 1918 whose final collapse led to the German defeat.

LUDWIG, EMIL (1881-). A German writer. He was born at Breslau and studied at the university of that city. He wrote verse and prose, fiction, drama, essays and biography. His plays include: *Napoleon* (1906); *Der Spiegel von Shalott* (1907); *Trilogie der Renaissance* (1904-20); *Atalante, Ariadne* (1914); *Friedrich von Preussen* (1914). His novels are: *Manfred und Helene* (1911); *Diana* (1918), *Meeresstille und Gluckliche Fahrt* (1920). He is also the author of the essays, *Der Kunstler*; of the lyric volume, *Romische Sonette* (1921), of a life of Wagner (1913), and is most highly esteemed for his *Goethe, Geschichte eines Menschen* (1920).

LUTHERANS. The third largest Protestant church in the United States, established officially in America in 1648, historic records showing Lutherans in America as early as 1562. The congregations, the central units and seat of final authority, were organized in synods or general bodies. The Lutherans of the United States and Canada accept the Canonical Scriptures of the Old and New Testaments as the inspired Word of God and as the only infallible rule and standard of faith and practice. They accept and confess the three ecumenical creeds, namely, the Apostles, the Nicene, and the Athanasian. They accept and hold the Unaltered Augsburg Confession as the correct exhibition of the faith and doctrine of the Evangelical Lutheran Church, founded upon the Word of God. All accept and use Luther's Small Catechism. None reject any of the other Symbolical Books of the Evangelical Lutheran Church, namely, the Apology of the Augsburg Confession, the Smalcald Articles, the Large and Small Catechisms of Luther, and the Formula of Concord. Many accept all of these.

The following statistical table shows the totals of the parochial reports made in the years 1914 and 1924:

	1914	1924
Congregations	14,871	15,426
Ministers	9,407	10,865
Baptized Members	3,684,315	3,801,235
Confirmed Members	2,370,656	2,539,939
Congregational Expenses .	\$10,275,269	\$30,258,002
Benevolent Contributions .	3,214,644	9,402,105
Total Expenditures	13,489,913	39,660,107
Total Valuation of Property	99,019,621	203,234,636
Sunday Schools—Number . .	5,923	10,581
Officers and Teachers . . .	76,113	101,110
Scholars	927,737	1,058,075

During the period, 12 foreign mission societies carried on work in more than 15 countries. After the War, many mission fields formerly supported by the Lutherans of Germany were aided through the National Lutheran Council.

The outstanding events of the decade among the Lutherans of the United States and Canada were: the celebration in 1917 of the 400th anniversary of Luther's posting of the Ninety-Five Theses; the formation of the Norwegian Lutheran Church of America by the merging of

three Lutheran organizations in 1917; the formation by the merging of several other bodies in 1918 of the United Lutheran Church in America, which included in its membership more than one-third of all the Lutherans in the United States and Canada; and the formation of the Evangelical Lutheran Joint Synod of Wisconsin and Other States; the appearance in 1917 of the Lutheran *Common Service Book*; the organization in the same year of the National Lutheran Commission for Soldiers' and Sailors' Welfare, which was supported by the various general bodies and churches; and the organization in 1918 of the National Lutheran Council, an agency for two-thirds of the Lutherans of the United States and Canada for carrying on the regular work of representation, statistics, reference, and publicity, and also emergency relief work. This latter agency gave at least \$6,500,000, including more than \$2,800,000 in the form of clothing, and over \$3,700,000 in the form of cash, for the relief of Lutherans in Europe.

Among the celebrations of the 10 years were: the 400th anniversaries of Luther's appearance before the Diet of Worms, of the appearance of Luther's translation of the New Testament, and of the introduction of congregational singing and the development of hymnology under the influence of the Reformation; and the anniversaries, 175th, 100th, 75th, and 50th respectively, of the Pennsylvania Ministerium, the Maryland Synod, the Missouri Synod, and the Synodical Conference. The Muhlenberg Building was dedicated in 1924 by the United Lutheran Publication House. Led by the veteran Dr. George U. Wenner, the Lutherans reemphasized religious education, especially promoting the idea of week-day religious instruction after school hours. Tens of millions of dollars were subscribed for endowments of Lutheran educational institutions, and millions of dollars to the Ministerial Relief and Pension Funds.

The Lutherans of America took part in the first Lutheran World Convention held at Eisenach, Germany, Aug. 19 to 26, 1923. There were 160 delegates and representatives from 22 or more nations of Europe, Asia, North America, and Australia. With the exception of the Synodical Conference of North America, with about 1,000,000 members, they represented the Lutherans of the world, or about 80,000,000 members. Carefully prepared papers including doctrinal and practical themes of fundamental importance were presented, followed by free discussions. The Rt. Rev. Ludwig Ihmels, D.D., Bishop of Saxony, was made chairman of the Convention. The following doctrinal statement was unanimously adopted: "The Lutheran World Convention acknowledges the Holy Scriptures of the Old and New Testaments as the only source and the infallible norm of all Church teaching and practice; and sees in the Lutheran Confessions, especially the Unaltered Augsburg Confession and Luther's Small Catechism, a pure exposition of the Word of God."

LUXEMBURG. This Grand Duchy, bounded by Germany, Belgium and France, has an area of 999 square miles and population of 263,824 (1916). The population in 1910 was 259,899. The capital, Luxembourg, had 45,986 inhabitants in 1921, as compared with 20,848 in 1910. The activities of the population were equally divided between agriculture and industry. The principal crops were oats and potatoes,

while the vine was cultivated in the Moselle Valley region. The economic wealth of the country was, however, centred in its iron fields which continued to average an annual yield of 7,000,000 tons. The iron ore was employed in the manufacture of pig iron and steel by local works. In 1912, the production of pig iron was 2,252,229 tons; in 1918 it was only 1,226,671 tons; but after the War it recovered, reaching 3,704,300 tons in 1920. The production of steel continued steadily to lose ground; 1,296,407 tons were produced in 1916; by 1920, only 692,935 tons.

Although in accordance with the Treaty of London (1867) Luxembourg, like Belgium, was permanently neutralized, and its integrity and independence guaranteed, nevertheless, like Belgium again, the grand duchy was invaded by German troops, Aug. 2, 1914, and occupied throughout the War. No attempt was made to interfere with civil affairs after 1915, but the German hand was felt in the check on the dissemination of opinion through a censorship on posts, wires, etc. A cabinet crisis was precipitated in 1915 and affairs were at a deadlock until the formation of a Catholic-Socialist-Liberal coalition government in February, 1916. The conclusion of the War saw the appearance of a new independent spirit in the population. Agitation in particular was aimed at the severance of the economic union with Germany, in existence since 1842, as well as for the erection of a more liberal frame of government. The result was the abdication of the Grand Duchess Marie Adelaide on Jan. 12, 1919, the ascension to the throne of the Princess Charlotte, and the holding of a plebiscite in September for the determination of the political and economic status of the country. The vote on the former indicated that the Luxemburgers preferred the continuance of the ruling dynasty to a republic; on the question of a new economic union, 60,133 votes were cast in favor of alliance with France against 22,242 in favor of a Belgian alliance. In 1921, however, France yielded up her rights to Belgium with the result that a treaty, completed on July 25, 1921, effected an agreement between Belgium and Luxembourg by which the two agreed to level their customs barriers for 50 years. Belgian currency was introduced into Luxembourg and the Belgians consented to float a loan of 175,000,000 francs for the retirement of German marks then in circulation. The agreement went into effect May 1, 1922.

LUXEMBURG, Rosa (1870-1919). A German-Jewish Socialist and revolutionary agitator, born in Poland. She became a socialist in her student days. She entered Germany in 1895. In order to obtain German nationality she went through a form of marriage with a German workman named Luxemburg. After employment on various socialist newspapers, she went to Poland to aid the Russian revolutionary movement there in 1905 but soon returned to Germany and engaged in extreme communistic propaganda. With Karl Liebknecht she founded the Spartacus League. In 1914 at outbreak of the War she was sentenced to a year's imprisonment for inciting insubordination. Throughout the War she remained in preventive custody. When set at liberty again she instigated street fighting in Berlin. Liebknecht was shot while being conveyed to prison. Rosa Luxemburg was brutally beaten by a mob and shot to death.

LUXURY TAXES. See **TAXATION IN THE UNITED STATES.**

LVOV, GEORGE EUGENIEVITCH, PRINCE (1861-1925). A Russian statesman. He studied law and took his degree in 1885. He was the owner of great estates and devoted much of his time to the organization and development of the Zemstvos, or agricultural coöperative societies. In 1905, he was elected a member of the first Duma. He joined the right wing of the Constitutional Democratic party. During the Russo-Japanese War, he was active in organizing relief among the Zemstvos, and also carried on this work with great efficiency during the great War. In 1917, at the outbreak of the Russian Revolution, he was chosen premier and minister of the interior in the provisional government. Later he became leader of the cabinet in the coalition government, but he showed a lack of administrative ability and retired. Following the accession to power of the Bolsheviks, he was arrested but escaped and finally settled in Paris, where he was one of the leaders of the anti-Bolshevist movement.

LYAUTEY, LOUIS HUBERT GONZAGE (1854-). A French soldier, administrator and writer (see **VOL. XIV**). In 1912, he was appointed resident minister in Morocco, holding also the office of minister of foreign affairs. He administered this office with great efficiency and was successful in promoting the agriculture and trade of the colony. In 1916-17, he served for a short time as war minister in the cabinet of Briand, but in 1917 was reappointed to Morocco. He was made a marshal of France in 1920. He was a well-known writer and a member of the French Academy.

LYDSTON, GEORGE FRANK (1858-1923). An American surgeon and publicist born at Tuolumne, Cal., and educated in medicine in the New York University (M.D. 1879). After several years in New York, he settled in Chicago and was appointed professor of genito-urinary surgery and venereal diseases under the medical department of Illinois University. He was the first to write at length on the subject of sex gland-grafting in the male, an operation which is said to have been tested on his own person. His major writings comprise *Lectures on Syphilis* (1885); *Addresses and Essays* (1892). *Stricture of the Urethra* (1893); *Gonorrhea and Urethritis* (1892); *Surgical Diseases of the Genito-urinary Tract* (1899-1904); *The Diseases of Society* (1904); *Sex Hygiene for the Male* (1912); *Implantation of the Sex Glands* (1914); *Impotence and Sterility* (1917). Lydston engaged in a long controversy with the American Medical Association in respect to some of its policies.

LYMAN, EUGENE WILLIAM (1872-). An American theologian, born at Cummington, Mass. He was graduated from Amherst College in 1894 and took postgraduate courses at Yale and in Germany. After teaching in several schools, he was appointed professor of philosophy at Carleton College, Minn., in 1901, and was professor of theology at the Congregational College of Canada, Montreal, in 1904-05. From 1904 to 1913, he was a member of the faculty of Bangor Theological Seminary, and from 1913 to 1918, professor of the philosophy of religion and Christian ethics at Oberlin College. In 1918, he became professor of the philosophy of religion at the Union Theological Seminary in New York. He wrote *Theology and Human Problems* (1910); *God of the New Age* (1918); *Experience of God in Modern Life* (1918).

LYMAN, THEODORE (1874-). An American physicist, born at Boston, Mass. He was graduated from Harvard in 1897, where he also received his Ph.D in 1900. He became an assistant in physics at Harvard, where he remained, becoming full professor in 1917, and where he was also director of the Jefferson Physical Laboratory (1908-17). Dr. Lyman made important studies on phenomena connected with diffraction gratings, on the wave lengths of extreme ultraviolet light discovered by Schumann and also on the properties of light of extremely short wave length, on all of which he contributed valuable papers to the literature of physics in the proceedings of scientific societies. During the War he served in France with the American Expeditionary Forces, holding the rank of major of engineers.

LYNCHINGS. According to the Department of Records and Research of the Tuskegee Institute, there was a total of 573 lynchings in the United States in the decade 1914-24. Of the victims, 56 were whites and 517 were Negroes. The number of lynchings by years and the alleged causes for which the 573 persons were summarily put to death are shown in the accompanying tables.

NUMBER OF LYNCHINGS

Year	Whites	Negroes	Total
1914	3	49	52
1915	13	54	67
1916	4	50	54
1917	2	36	38
1918	4	60	64
1919	7	76	83
1920	8	53	61
1921	5	59	64
1922	6	51	57
1923	4	29	33
Total	56	517	573

ALLEGED CAUSES FOR LYNCHING

Year	Homicide	Felonious Assault	Rape	Attempted Rape	Robbery and Theft	Insults to Women	All Other Causes
1914	30	8	6	1	1	—	6
1915	26	10	11	—	9	3	8
1916	20	7	3	9	8	2	5
1917	6	2	7	5	2	2	14
1918	28	2	10	6	2	—	16
1919	28	3	9	10	1	6	26
1920	22	9	15	3	—	3	9
1921	19	7	16	3	—	3	16
1922	15	5	14	5	4	1	13
1923	5	4	6	1	1	1	15
Total	199	57	97	43	28	21	128

The decade 1914-24 was notable for (1) a growing sentiment against lynchings and (2) a large decrease in the number of lynchings. The growing sentiment against lynchings manifested itself in (a) the attitude of the press of the country, particularly the editorial policy of the leading newspapers, in speaking strongly against it; (b) expressions of religious denominations, particularly through the Federal Council of Churches, (c) expressions of organizations of white women of the South; (d) agitation for the enactment of laws against lynchings; and (e) the passing of laws by a number of States for the suppression of lynching. The agitation for suppressive legislation had its strongest expression in the effort to have a Federal anti-lynching law enacted. This effort extended over the entire decade. In 1920, an anti-lynching measure, later known as the Dyer Anti-lynching Bill, was jointly introduced in the House and Senate of the United States Congress. The press of the South strongly opposed the bill on the ground that it was an invasion of States' rights, and a Democratic filibuster in the House of Representatives in 1921 prevented its coming to a vote. On Jan. 26, 1922, however, the House passed the bill by a vote of 230 to 119. When the measure reached the Senate the question of its constitutionality was brought forward. On July 28, 1922, the Senate Judiciary Committee ruled that it was constitutional. A well-organized filibuster by the Democratic members of the Senate prevented it, however, from coming to a vote and on Dec. 2, 1922, the Republican caucus agreed to drop the measure and not to call it up again during that session of Congress. With the defeat of the Dyer Anti-lynching bill, newspapers and women's organizations of the South urged that it was now up to the States to take preventive measures. Such action was taken, during the decade, by nine States, either by the enactment of new laws or the strengthening of existing legislation against lynching. These States were Alabama, Kansas, Kentucky, Minnesota, New Jersey, North Carolina, Pennsylvania, Tennessee, and West Virginia.

The decrease in lynching during the decade is

shown by the following table, which compares the number of lynchings, 1914-24, with the number in each of the three previous decades.

COMPARISON OF LYNCHINGS BY DECADES
1884-1923

Decade	Number of Lynchings		
	White	Negroes	Total
1884-1893	751	990	1,741
1894-1903	322	1,020	1,342
1904-1913	63	673	736
1914-1923	56	517	573

LYNN. A manufacturing city of Massachusetts. The population increased from 89,336 in 1910 to 99,148 in 1920 and to 102,683 by estimate of the Bureau of the Census for 1923. The form of government was changed from the commission to the mayor and council type. In 1924, the city was spending \$1,500,000 for sewer development, and about \$3,000,000 on new schools. The value of the shoes produced in Lynn increased from \$46,660,000 in 1909 to nearly \$100,000,000 in 1924, and the total value of all manufactures rose from \$71,503,000 to more than \$160,000,000 during the same period.

LYON, BETHUEL B. VINCENT (1880-). An American physician, gastro-enterologist, who has introduced into clinical medicine a new method of diagnosis and treatment of gall bladder disease, termed by him "nonsurgical drainage of the gall bladder"; which is secured through the introduction of the duodenal sound through the stomach. Dr. Lyon received the degree of M.D. from Johns Hopkins in 1907 and was appointed professor of clinical medicine in Jefferson Medical College, in the department of gastro-intestinal diseases. He had done much original work in connection with the diagnostic and therapeutic use of the duodenal sound, collaborating for a time with the late Dr. Meltzer, and in 1923 first appeared his pioneer work *Nonsurgical Drainage of the Gall Ducts*, which has given rise to much controversy.

LYS RIVER, BATTLES OF. See **WAR IN EUROPE, Western Front.**

M

McADOO, WILLIAM GIBBS (1863-). An American cabinet officer (see VOL. XV). In 1913 he was appointed Secretary of the Treasury by President Wilson. His tenure of this office marked by the enormous complications and transactions of the entrance of the United States into the War, and in this work he showed great versatility and efficiency. In addition to his duties as Secretary of the Treasury, he was also Director General of Railways in 1917-19 and ex-officio chairman of the Federal Reserve Board. He resigned as Secretary of the Treasury on Dec. 10, 1918, and as Director General of Railways on Jan. 10, 1919. On May 7, 1914, he married Eleanor Wilson, daughter of Woodrow Wilson. He was the most prominent candidate for the Democratic nomination for the presidency until, in the early part of 1924, it was disclosed before the oil investigating committee of the Senate that he had been employed at a large annual salary by Edward F. Doheny, the oil magnate, some of whose leases in California were alleged to be fraudulent. Although Mr. McAdoo's employment had no connection with these leases and was considered, from a legal standpoint, quite legitimate, it materially affected his chances for the nomination. He was engaged in the practice of law in New York City. In the Democratic national convention held in New York City in 1924, McAdoo and Governor Smith of New York controlled enough votes to checkmate each other. The result was that neither was nominated, and John W. Davis was selected as a compromise candidate after more than 100 ballots had been cast. See RAILWAYS.

MACALESTER COLLEGE. A coeducational college under Presbyterian control, founded in 1884, at St. Paul, Minn. The number of students increased from 399 in 1913 to 634 in 1924, the faculty from 21 to 37 members, and the library from 13,600 to 16,500 volumes. In an endowment campaign in 1920 \$915,220 was raised. The gymnasium was under construction in 1924. Elmer Allen Bess, D.D., succeeded Thomas Morey Hodgman, LL.D., as president in 1918 and was succeeded in turn by John C. Acheson, Ph.D., in 1924.

McALEXANDER, CLYSSES GRANT (1864-). An American army officer, born in Dundas, Mich. He graduated from the United States Military Academy in 1887 and was commissioned 2d lieutenant in the same year. During the Spanish-American War he served in the field and was recommended for promotion for gallantry under fire. He saw service also in the Philippines and in 1906 was a member of the General Staff Corps. After serving as instructor of troops in 1916-17, he was given command of the 18th Infantry in France. As commander of the 38th Infantry, he took part in the second battle of the Marne and in other campaigns, including the last great German of-

fensive. He broke the great German offensive on the Marne on July 15, 1918, and won the sobriquet of "The Rock of the Marne." He received decorations from the American, French, and Italian government. He wrote *History of the Thirteenth Regiment* (1905).

McALLISTER, ADDAMS STRATTON (1875-). An American electrical engineer (see VOL. XIV). During 1918 he became connected with the Ordnance Department, Washington, D. C., and in 1921 with the Bureau of Standards. He contributed many articles on engineering subjects to technical publications during the period 1914-24 and published *The Descendants of John Thomson* (1917).

McARTHUR, DOUGLAS (1880-). An American soldier, born in Arkansas. He graduated from the United States Military Academy in 1903 and was commissioned 2d lieutenant of engineers in the same year. In 1917 he was appointed colonel of infantry in the National Army and in the same year became Chief of Staff of the 42d Division. He commanded the 84th Infantry Brigade in 1918 and the 42d Division later in the same year. He took part in all the great operations in France and served with the Army of Occupation in Germany. In 1919 he was appointed superintendent of the United States Military Academy and in 1923 became commander of the department of the Philippines. He received several divisional citations and decorations from the French, Italian, and Belgian governments.

McBAIN, HOWARD LEE (1880-). An American lawyer and educator, born in Canada. He graduated from Richmond (Va.) College in 1900 and afterward studied at Columbia and the University of Chicago. After teaching in schools in Richmond he lectured on constitutional history at the University of Virginia. He was appointed instructor of political science at Columbia in 1907, and in 1909 he became dean of the College of Political Science at George Washington University. From 1910 to 1913 he was associate professor of political science at the University of Wisconsin and in 1917 became associate professor of municipal science and administration and Eaton professor at Columbia University. He was a member of many legal and learned societies and was the author of *How We Are Governed in Virginia and the Nation* (1908); *The Law and Practice of Municipal Home Rule* (1916); and *American City Progress and the Law* (1917).

McCARRISON, ROBERT (1878-). A distinguished Irish physician. His professional activities have been largely associated with Hindustan and with the disease of goitre. Born in Lisburn, County Antrim, he was educated at Queen's College, Belfast, and entered the Indian Medical Service in 1901. He developed a special interest in goitre and cretinism and during 1913-14 investigated these affections for the government. Later he visited many medical centres in English-speaking countries to lecture

on goitre and made a tour of the United States for this purpose in 1921. His major writings are *Collected Papers on Goitre and Cretinism* (1916); *The Thyroid Gland in Health and Disease* (1917), and *Studies in Deficiency Disease* (1921). He was placed in charge of the Pasteur Institute at Coonoor on its establishment.

McCHORD, CHARLES CALDWELL (1859-). An American lawyer and public official (see VOL. XIV). From 1910 he served as a member of the Inter-State Commerce Commission and from 1915 as chairman and was reappointed a member of the Commission in the same year. In 1918-19 he was a member of the Railway Wage Commission and arbitrator of the War Labor Board.

McCOLLUM, ELMER VERNER (1879-). An American biochemist, born near Ft. Scott, Kan., and educated at Kansas and Yale Universities. From 1907 to 1917 he held the chair of agricultural chemistry in the University of Wisconsin, resigning to accept the professorship of biochemistry in the Johns Hopkins University School of Hygiene and Public Health. He has published many papers on nutrition, diet, vitamins, etc., and several textbooks, which include *Textbook of Organic Chemistry* (1916); *The Newer Knowledge of Nutrition* (1918), and *The American House Diet* (1920). Professor McCollum has published an account of the fourth vitamine, known as Vitamine D, lack of which from the nutriment is believed to play an important rôle in the genesis of rickets.

McCOMBS, WILLIAM FRANK (1875-1921). An American lawyer (see VOL. XIV). From 1912 until 1916 he was chairman of the Democratic National Committee. He was offered but declined the ambassadorship to France. Both before and after his death there was much discussion in respect to the controversy between him and the supporters of the Wilson administration as to whether he had been fairly treated by Mr. Wilson in view of the great services which he had rendered in bringing about the latter's nomination and election. A volume giving Mr. McCombs' side of the controversy was published in 1921.

McCOOK, PHILIP JAMES (1873-). An American jurist, born at Niantic, Conn., and educated at Trinity College and the Harvard Law School. In 1899 he began practice of law in New York. He was special master in the United States District Court in 1919 and in the same year became Justice of the Supreme Court of New York State. He served in the Spanish-American War in Cuba and the Philippines and in the War in Europe as major in the Adjutant-General's department. He was a trustee of Hunter College and the Law Committee of the Charity Organizations Society and Legal Aid Society.

McCORMICK, CYRUS HALL (1859-). An American manufacturer, born at Washington, D. C., and educated in the public schools. He went into his father's business. He was the inventor of the reaping machine. From 1894 to 1902 he was president of the McCormick Harvesting Machine Company and of the International Harvester Company from 1902 to 1919. In 1917 he was a member of the special diplomatic mission of the United States to Russia. He was a trustee of Princeton University and a director of the McCormick Theological Seminary.

McCORMICK, VANCE CRISWELL (1872-).

An American newspaper publisher and public official, born in Harrisburg, Pa., and educated at Yale University. For several years he was engaged in the newspaper business in Harrisburg. He served as mayor of that city from 1902 to 1905. In 1914 he was Democratic candidate for governor and in 1916 served as chairman of the Democratic national campaign committee. He was chairman of the War Trade Board from 1917 to 1919 and in the former year was also a member of the War Commission of Great Britain and France. At the peace conference in Paris, he acted as adviser to the American commission. He was a director of many important financial institutions and a member of the Yale Corporation.

McCOY, FRANK ROSS (1874-). An American soldier, born in Lewistown, Pa. He graduated from the United States Military Academy in 1897 and was appointed 2d lieutenant of the 8th Cavalry in the same year. He served on the western frontier in Cuba, in the Philippines, and in the Santiago campaign. In Cuba and the Philippines he acted as aide to General Wood and was for several years aide to President Roosevelt. He was appointed a member of the General Staff in 1911 and after service as military attaché in Mexico became a member of the General Staff of the American Expeditionary Forces in 1917. He commanded the 63d Infantry Brigade in 1918 and was director of the army transport service and deputy director general and later director general of transportation for the A. E. F. in 1918-19. In the latter year he also served as chief of staff to the American military mission to Armenia and as special commissioner to the Philippines. He wrote *Principles of Military Training* (1918).

McCOY, HERBERT NEWBY (1870-). An American chemist, born at Richmond, Ind., and educated at Purdue and Chicago Universities. He entered professional practice in Chicago and held the chair of chemistry and physics at Fargo University, after which he returned to the University of Chicago as assistant in chemistry. In 1899 he became assistant professor at the University of Utah. In 1901 he returned again to Chicago and was professor there from 1911 to 1917, when he resigned to accept the vice presidency of the Lindsay Light Company. From 1919 he was president of the Carnotite Reduction Company. His researches covered quinazolin derivatives in organic chemistry; equilibrium in carbonate solutions and secondary ionization constants in physical chemistry; rare earths in mineral chemistry, and radioactivity. He has published papers in these subjects. He wrote, with Ethel M. Terry, an *Introduction to General Chemistry* (1919) and *A Laboratory Outline of General Chemistry* (1919).

McCULLOUGH, ERNEST (1867-). An American civil engineer, born on Staten Island, N. Y., and educated at the Van der Naillen School of Engineering in San Francisco. He at once entered on the practice of his profession as a civil engineer, at first in San Francisco, and later in Chicago. During 1893-96 he was editor of *Engineer and Contractor* in San Francisco; he became associate editor of *Engineering-Contracting* (Chicago) in 1909 and of the *Railway Age* in 1910. He was later an associate editor of *The American Architect*. During the War he was a lieutenant-colonel in the Chemical Warfare Service in France, and in 1919-20, director of the officers' school for that service at

Lakehurst, N. J. He is the author of *Country Roads* (1891); *Farm Drainage* (1892); *Municipal Public Works* (1894); *Engineering Work in Towns and Cities* (1906); *Reinforced Concrete* (1908); *Engineering as a Vocation* (1911); *Practical Surveying* (1915); and *Practical Structural Design* (1917).

MCCULLY, NEWTON ALEXANDER (1867-). An American naval officer, born in Anderson, S. C. He graduated from the United States Naval Academy in 1887 and in 1889 was made ensign. He was promoted to be commander in 1909, captain in 1913, and rear-admiral in 1919. His duties included the command of several important battleships and service in various capacities on shore. From 1914 to 1917 he was naval attaché at St. Petersburg and represented the Navy Department in connection with the Russian commission to the United States. In 1917-18 he commanded the patrol squadron off the coast of France and in 1919 was commander of the American naval forces in American waters. In the following year he acted as special agent for the Department of State in southern Russia and in 1921-22 commanded the patrol force of the Atlantic fleet.

MCDERMOTT, GEORGE ROBERT (1860-). An American naval architect, born at Glasgow, Scotland. After an academic and technical education in Glasgow, he served as naval architect for several shipbuilders in Scotland and in the naval construction works in England. He removed to the United States and was successively assistant professor of naval architecture and professor of naval architecture in charge of the Department of Naval Architecture and Marine Engineering at Sibley College in Cornell University. During the War he served with the United States Shipping Board and the Emergency Fleet Corporation and as technical adviser of the American Bureau of Shipping in 1919. He was a member of many architectural societies.

MACDONALD, JAMES RAMSAY (1866-). A British public official, leader of the Labor party (see Vol. XIV). He was not in sympathy with Great Britain's entry into the War and was defeated for Parliament in 1918. But in 1922 he was elected, and the Labor party was numerically the second party in the House of Commons. Ramsay MacDonald became the official leader of the Opposition. Two years later, on Jan. 22, 1924, he was made Prime Minister and headed the first Labor government in Great Britain. See GREAT BRITAIN.

MCDONALD, JOHN DANIEL (1863-). An American naval officer, born in Machias, Me. He graduated from the United States Naval Academy in 1884 and was promoted to be commander in 1908, captain in 1911, and rear-admiral in 1917. He served during the Spanish-American War and commanded several war vessels. From 1913 to 1915 he was a member of the staff of the Naval War College and in 1915-16 was chief of staff of the Atlantic fleet. He was appointed commandant of the New York Navy Yard in 1918, with the rank of vice admiral.

MCDUGALL, WILLIAM (1871-). One of the leading Anglo-American psychologists (see Vol. XIV). During the War he was attached to the medical service of the British Army. In 1920 he was called from his post at Oxford to head the psychology department at Harvard University. In his *Outline of Psy-*

chology (1923), the eminent psychologist modified his conception of instinct so as to allow for growth and transformation of the presumed hereditary dispositions.

Professor McDougall's other works deal largely with the problems of national psychology which transcend mere science and involve ethical theory. *The Group Mind* (1920) and *Is America Safe for Democracy?* (1922) are noteworthy for their defense of the superiority of the Nordic race. *Ethics and Some Modern World Problems* (1924) contains a warning against sentimental idealism as a guiding principle of national conduct. He was also interested in psychical research and took a leading part in the activities of both the British Societies for Psychical Research. See SOCIAL PSYCHOLOGY.

MCELROY, ROBERT (MCNUTT) (1872-). An American educator, born at Perryville, Ky., and educated at Princeton University, in Germany, and at Oxford. In 1898 he was instructor of history at Princeton and was successively assistant professor of American history and Edwards professor of American history (from 1909). He was also head of the department of history and politics at Princeton, 1912-16, and was the first American exchange professor to China in 1916-17. He lectured in China, Japan, and the Philippines on government. He was educational director of the National Security League from 1917 to 1919 and was organizer of the national campaign for the celebration of "Constitution Day" in 1919. He was a member of many learned societies and wrote *Kentucky in the Nation's History* (1909); *The Winning of the Far West* (1914), and *The Representative Idea in History* (1917).

MCELWAIN, FRANK ARTHUR (1875-). An American bishop, born at Warsaw, N. Y., and educated at Trinity College and the Seabury Divinity School. In 1902 he was ordained deacon and became a priest in the following year. He held several pastorates in Missouri and from 1907 to 1912 was on the faculty of the Seabury Divinity School. In 1912 he was elected suffragan bishop of Minnesota and was consecrated bishop in 1917.

McFARLAND, JOSEPH (1868-). An American pathologist and bacteriologist, born at Philadelphia. Soon after receiving his M.D. from the University of Pennsylvania in 1889 he became professor of pathology and bacteriology in the Medicochirurgical College, from which he resigned in 1916 to accept the same chair in his Alma Mater. He has published several textbooks: *Pathogenic Bacteria* (1886); *Textbook of Pathology* (1904), and *Biology, General and Medical* (1910). A semipopular work, *Fighting Foes too Small to See*, was published in 1924, and in the same year his *Surgical Pathology*. He also collaborated with Deaver and McFarland in *The Breast* (1917).

McFEE, WILLIAM (1881-). An American author, born in London, and educated in the East Anglican School, Bury St. Edmunds, England. He entered the marine service as engineer and chief engineer of transports. He wrote *An Ocean Tramp* (1908), which was followed by *Aliens* (1914); *Casuals of the Sea* (1916); *Captain Macdoine's Daughter* (1920); *A Six-Hour Shift* (1920); *Harbors of Memory* (1921); *Command* (1922), and *Race—a Prelude* (1924). His books show great descriptive power and an unusually attractive style.

MCGILL UNIVERSITY. A Canadian in-

stitution at Montreal, Quebec, founded in 1821, standing at the head of a group of affiliated colleges and schools, and itself affiliated with the universities of Oxford, Cambridge and Dublin. The student enrollment numbered 1600 in 1914, dropped during the War to 1045, but rose again to 2767 in 1923-24. The faculty increased during the period 1914-24 from 265 to 417 members and the library from 184,000 to 215,900 volumes. The productive endowment was increased correspondingly from \$8,207,000 to \$17,344,210, and the annual income from \$820,000 to \$1,722,765. The university received \$1,000,000 in 1918 from the Carnegie Corporation of New York, "in recognition of the noble and devoted service and sacrifice of McGill toward Canada's part in the great war." Sir William C. Macdonald bequeathed various sums to the university, including \$500,000 towards the endowment of the Medical School, \$300,000 toward the endowment of the Conservatory of Music, \$20,000 to provide traveling scholarships in the faculty of law, and \$1,000,000 for Macdonald College. The university also received \$100,000 from the estate of James Ross in 1914. In 1920 subscriptions made to the Centennial Fund totaled \$4,440,000, not including gifts of \$1,000,000 each from the Rockefeller Foundation and from the Quebec government. The biological building was erected in 1922 at a cost of \$716,000, and the pathological building was completed in 1923 at a cost of \$450,000. The course in the School of Commerce was lengthened from three to four years in 1923. Sir Arthur Currie, G.C.M.G., K.C.B., LL.D., succeeded Sir William Peterson, G.C.M.G., K.C.B., LL.D., D.Litt., as president in 1920.

McGLACHLIN, EDWARD FENTON (1868-). An American soldier, born in Fond du Lac, Wis. He graduated from the United States Military Academy in 1889 and was commissioned in the artillery. He served in various capacities with the field artillery and was promoted to be colonel in 1916. In the following year he was made brigadier-general of the National Army and in 1918 major-general. He served in the Philippine campaigns and from 1914 to 1916 was commandant of the School of Fire for Field Artillery. In 1917 he was appointed commander of the 165th Field Artillery Brigade and later commanded several other brigades. He was made chief of artillery of the 1st Army Corps in 1918 and commander of army artillery and chief of artillery of the 1st Army in the same year. From November, 1918, to September, 1919, he was commander of the 1st Division, and from 1919 to 1921 he commanded the 7th Division. From the latter year he was commandant of the Army War College and contributed many articles to army periodicals.

MacGOWAN, KENNETH (1888-). An American author, born at Winthrop, Mass., and educated at Harvard. He became editor of *The Theatre Arts*, a monthly magazine, in 1919. After 1923 was dramatic critic for *Vogue*. Previously he had been dramatic, literary, and photoplay critic for the *Philadelphia Evening Ledger* (1914-17); publicity director for the Goldwyn Picture Corporation (1917-18); special writer on the New York *Tribune* (1918); advertising agent for the Goldwyn Picture Corporation (1919), and critic for the New York *Globe* (1919-23). His books on the theatre are *The Theatre of To-Morrow* (1921); *Continental*

Stagecraft (1922), and *Masks and Demons* (1923).

McGRAW, JOHN J. (1873-). Professional baseball player and manager, born at Truxton, N. Y. He was with the Olean Club in 1890, Cedar Rapids in 1891, and Baltimore. 1891 to 1899, becoming manager in the last-named year. In 1900 he played with the St. Louis National League team and managed the Baltimore American League Club in 1901 and 1902. Since 1902 he has been manager of the New York National League team, familiarly known as the "Giants," winning penants in 1904, 1905, 1911, 1912, 1913, 1917, 1921, 1922, and 1923 and world's championships in 1905, 1921, and 1922, a record of achievement attained by no other big league manager.

McGREGOR, JAMES HOWARD (1872-). An American zoölogist, born at Bellaire, Ohio. He was educated at Ohio State and at Columbia Universities. He was assistant in zoölogy at Ohio State University (1894-95). In 1897 he went to Columbia University, where he was successively assistant, tutor (1899-1904), lecturer (1904-06), instructor (1906-07), adjunct professor (1907-14), associate professor (1914-24), and professor of zoölogy. He published articles on vertebrate morphology and paleontology and modeled an important series of reproductions of heads of types of primitive man.

MACHEN, ARTHUR (1863-). An English writer. His early books include *The Chronicles of Clemendy*, *The Great God Pan*, *The Three Impostors*, *The Hall of Dreams*. Of late years his books have acquired considerable vogue both in England and the United States. Among his recent publications are *The Great Return*, *The Secret Glory*, and *Far-Off Things*.

MACHINE GUN ORGANIZATION. See ARMIES AND ARMY ORGANIZATION.

MACHINE GUNS. See ORDNANCE; SMALL ARMS.

McINTYRE, FRANK (1865-). An American military officer, born at Montgomery, Ala., and educated at the United States Military Academy. He entered the United States Army as second lieutenant in the 19th Infantry, serving in various ranks until he attained that of brigadier-general in 1912. Meanwhile he saw duty at different posts, chiefly on the Mexican border, until the war with Spain, in which he participated in the Porto Rico expedition in 1898. He was in the Philippines during 1899-1902, after which for two years he was with the general staff. He was attached to the Bureau of Insular Affairs in 1905 and became its chief in 1912. During the War in Europe he was assistant chief of staff with the rank of major-general.

McKEE, RALPH HARPER (1874-). An American chemist, born at Clinton, Mo., and educated at Wooster and Chicago Universities. During 1901-09 he was professor of chemistry at Lake Forest, and during 1909-16 he held a similar chair at the University of Maine; in 1917 he became professor of chemical engineering at Columbia. In New York, Professor McKee had a valuable commercial practice and was consultant to various chemical corporations. During the War he was director of the United States Ordnance School of Explosives.

McKENNA, REGINALD (1863-). An English statesman and financier (see VOL. XIV). He was a Liberal member of Parliament from 1895 to 1918, and from 1911 to 1915 he served

as Home Secretary. In the latter year he was Chancellor of the Exchequer, and as such brought in the famous budget of September, 1915, recognized as an able attempt to deal with the financial conditions arising out of the War. In 1915 he also introduced a new war loan. He retired from politics to assume the chairmanship of the London Joint Stock and Midland Bank in 1919. He was a member of the British-American Debt Fund Commission, in 1923.

MCKENNA REPORT. See REPARATIONS.

MACKENSEN, AUGUST VON (1849-). A Prussian field marshal, born at Hausleipnitz in Saxony. He was at Danzig commanding the 17th Army Corps when the Crown Prince was sent there to be kept from troublesome political activities. On the eastern front in 1914 he commanded the 9th Army and won engagements with the Russians at Kutno, Lodz, and Lowitz. In 1915 he headed the German troops in western Galicia and later in the same year was made a field marshal. He was the commanding general also of the troops sent to Serbia and to Rumania during 1915 and 1916. After the Armistice in 1918, the French interned him at Neusatz, where he was forced to remain until nearly the end of 1919, although the German government protested vigorously.

MCLEAN, ANGUS WILTON (1870-). An American lawyer, born in Robeson County, N. C., and educated in the law department of the University of North Carolina in 1892. In the same year he began the practice of law. He took an active part in State Democratic politics. From 1918 to 1920 he was director of the War Finance Corporation in Washington and was its managing director in 1920-21. In the same year he served as Assistant Secretary of the Treasury. He was a member of several commissions during the War in Europe. He was president of the trustees of the Flora MacDonald College and of the Union Theological Seminary at Richmond, Va. and a member of many learned societies.

MACLEOD, JOHN JAMES RICKARD (1876-). A Scotch-American physiologist and Nobel prize winner, born at Dunkeld, Scotland, and educated at the University of Aberdeen. In 1898 he devoted himself to the study of physiology and in 1903 was called to the chair of physiology at Western Reserve University, to succeed G. N. Stewart. He resigned this professorship in 1917 to accept a like chair in the University of Toronto, where he became the senior member of the group of workers who discovered insulin. The Nobel prize in medicine for 1923 was divided between MacLeod and Banting (q.v.). He had already published a book on diabetes. Beginning as a collaborator in small textbooks on physiology and chemistry, he later wrote *Diabetes* (1913) and *Physiology and Biochemistry in Modern Medicine* (1918). A prolific contributor to periodical literature, he published many papers on insulin.

MACMONNIES, FREDERICK (WILLIAM) (1863-). An American sculptor (see VOL. XIV). He executed the colossal group, "Civic Virtue," at the City Hall Fountain in New York (1919). It was the subject of considerable controversy.

MACNEIL, HERMON ATKINS (1866-). An American sculptor (see VOL. XIV). He won the gold medal at the Panama-Pacific International Exposition in 1915. Two years later he was awarded the medal of honor of the Architectural League in New York. In 1923 he was

awarded the Saltus medal for excellence.

McRAE, JAMES HENRY (1863-). An American soldier, born in Lumber City, Ga. He graduated from the United States Military Academy in 1886 and was commissioned 2d lieutenant in the same year. He rose to the rank of adjutant-general in 1913 and in the following year was appointed colonel of infantry. He was commissioned major-general in the National Army in 1918 and brigadier-general in the Regular Army in 1920. He took part in the Spanish-American War and in the campaigns in the Philippines. In 1917 he commanded the 9th Brigade, 5th Division, and in 1918-19 was commander of the 78th Division. He participated in St. Mihiel and in the Meuse-Argonne operation. From 1921 he was assistant chief of staff. He received decorations from the American and foreign governments.

MADAGASCAR. A French island colony off the southeastern coast of Africa. Area, 226,916 square miles; population, census of 1921, 3,387,968, of whom 17,149 were French and 10,310 other non-Malagasy, largely Asiatics. The populations of the chief towns were, in 1921: Antananarivo, the capital, 63,115; Tamatave, 15,000; Diégo Suarez, 10,377; Mananjary, 8927; Fianarantsoa, 8231. The principal ports were Tamatave (east coast), Majunga (northwest), Diégo Suarez (north), Tuléar (southwest). Agricultural products showed increases generally during the period 1912-22. In 1921, 12,800 tons of rice were exported (value 12,818,000 francs), about 13,500 tons of manioc (value 14,520,000 francs), and 21,000 tons of vegetables (value 21,000,000 francs). Other crops of importance were sugar cane, coffee, cacao, and vanilla. Besides these, the export trade embraced raffia, graphite, tanning bark, caoutchouc, tapioca, and gold. The extensive cattle breeding accounted for the importance of the hide industry as well as the appearance of local meat packing plants. Large factories for preserving and chilling meats were established at Majunga, Diégo Suarez, and other centres. In 1921 the export of preserved meats totaled 7,764,000 francs, although in 1922 this was only 2,880,000 francs. Cattle numbered 7,518,657 in 1923, as compared with 5,320,200 in 1913. Exports for 1913, 1920, 1921 and 1922 were 56,054,377 francs, 235,942,698, 108,308,000 and 138,472,491. Imports for the same years were 46,747,000 francs, 279,694,657, 225,921,000, and 173,921,000. Leading imports were cotton goods, beverages, metals, machinery, and clothing. Proportions of exports taken and imports sent for 1921 by leading countries trading with Madagascar were: France, 65 and 78 per cent; French colonies, 9 and 6 per cent; United Kingdom, 12 and 3 per cent; British colonies, 8 and 9 per cent. The United States came next after these. In 1921, 5604 vessels of 1,566,786 tons entered and 5665 vessels of 1,555,217 tons cleared at Madagascar ports. In 1912, 1,756,764 tons entered. Besides that from Antananarivo to Tamatave (240 miles), the following railways were in the course of construction: Antananarivo-Antsirabe (240 miles), of which 27 miles were finished in 1923, Moramanga-Ambatondrazaka (89 miles), a branch of the Tamatave railway projected to reach the northern provinces. A good system of metalled roads, 1611 miles long, made communication between the various centres easy. The 1923 budget totaled 90,660,991 francs, as compared with the 1911 budget of 31,153,000 francs. By Jan. 1, 1922, the public debt had

mounted to 105,000,000 francs. The colony prospered during the War, and work on internal improvements went on steadily. In 1921 an ambitious programme for the electrification of railways and the construction of a hydroelectric power station on the Vohitra River was announced. This project was later augmented to include the construction of 288 miles of wide-gauge and 468 miles of narrow-gauge road.

MAETERLINCK, MAURICE (1862-). A Belgian poet (see VOL. XIV). During the War he performed effective service in relief work in France and Belgium and wrote much in opposition to the German rule in Belgium. His later books include *Wrack of the Storm* (1916); *The Betrothal* (1918); *The Burgomaster of Stilemonde* (1918); and *Les Sentiers dans la Montagne* (1919). He visited the United States in 1921, with the intention of lecturing in various cities, but his lack of acquaintance with the English language led to the abandonment of this enterprise.

MAGNESIUM. See CHEMISTRY.

MAH-JONGG, PUNG-CHOW, or PE-LING. An ancient Chinese game which has attained considerable popularity throughout Europe and America in recent years. It is played with pieces, "tiles," somewhat after the nature of dominoes but lends itself more readily to the gambling instinct than the latter game. The so-called "sets" comprise as many as 144 pieces, the higher-priced ones being made from ivory and most handsomely carved.

No standard rules and regulations have as yet been adopted, the methods of playing the game varying greatly. The Chinese confine themselves chiefly to building up a strong defense whereas the Europeans and Americans concentrate on the wide opportunities the game offers for offensive tactics.

Fairly comprehensive works on the game are: *How to Play Mah-jongg*, by Jean Bray, Putnam's Sons, New York and London, 1923, and *How to Play Pung-Chow* by L. I. Harr, Harper and Brothers, New York and London, 1923.

MAINE. Maine is the thirty-eighth State in size (33,040 square miles), and the thirty-fifth in population; capital, Augusta. The population increased from 742,371 in 1910 to 768,014 in 1920, a gain of 3.5 per cent. The white population rose from 739,995 to 765,695, the native whites increasing from 629,862 to 658,346. The negro population decreased from 1363 to 1310; the foreign-born whites, from 110,133 to 107,349. The urban population mounted from 262,248 to 299,569, while the rural population fell from 480,123 to 468,445. The growth of the principal cities was as follows: Portland, (1910) 58,571 to (1920) 69,272; Lewiston, 26,247 to 31,791; Bangor, 24,803 to 25,978.

Agriculture. Maine was one of the New England States in which there was only slight decline in the percentage of rural population, from 64.7 in 1910 to 61 in 1920. While the population of the State increased 3.5 per cent in the decade 1910-20, the number of farms decreased 19.6 per cent (from 60,016 in 1910 to 48,227 in 1920); the acreage of land in farms, from 6,296,859 to 5,425,968, and the improved land in farms, from 2,360,657 to 1,977,329 acres. The total value of farm property showed an apparent increase, from \$199,271,998 in 1910 to \$270,526,733 in 1920, or 35.8 per cent; the average value per farm, from \$3320 to \$5609, or 68.9 per cent. In interpreting these values, however,

and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration; the index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes decreased from 32.9 in 1910 to 28.4 in 1920; the percentage of improved land from 37.5 to 36.4. Of the 48,227 farms in 1920, 45,437 were operated by owners, 786 by managers, and 2004 by tenants. The comparative figures for 1910 were 56,454, 999, and 2563. White farmers in 1920 numbered 48,214, as compared with 59,987 in 1910; foreign-born farmers, chiefly Canadians, numbered 4384, compared with 4973. Farms free from mortgage in 1920 numbered 30,665; in 1910, 41,309. Those under mortgage numbered 13,023 in 1920; in 1910, 14,948. The number of dairy cows in 1920 was 217,021, compared with 156,819 in 1910; "beef cows," 9956 and 8019; sheep, 119,471 and 149,934. There was a noticeable increase in dairying. The growing of potatoes for seed had become a large industry. The estimated production of the chief farm crops in 1923 was as follows: corn, 1,256,000 bushels; spring wheat, 220,000; oats, 4,780,000; barley, 104,000; potatoes, 27,454,000; and hay, 1,513,000 tons. Comparative figures for 1913 are: corn, 608,000 bushels; wheat, 76,000; oats, 5,600,000; barley, 140,000; potatoes, 28,160,000; and hay, 1,194,000 tons.

Manufactures. While Maine is not one of the most important industrial States, it has manufacturing interests of great importance. See UNITED STATES, *Manufactures*.

Education. In the decade 1914-24 there was a steady improvement in educational conditions in the State. Special attention was given to the needs of rural communities. The Legislature during this period enacted many important measures affecting education. This was especially true in 1919, when provision was made for rotation agricultural schools under the supervision of the State Board for Vocational Education; the industrial education act was amended to provide for a programme of Americanization; a rural teaching provision was virtually established, which is said by experts in education to be one of the most direct approaches to the rural school problem yet presented, and a State-wide compulsory physical education law and an act reorganizing the law affecting the schools in unorganized territory were passed. More recent advances in the State are the establishment of the State school fund, to be distributed on the basis of teaching positions, aggregate daily attendance, and school census, approximately one-third each; and the establishment of a special school for the training of rural leaders, 100 each year. Consolidation of schools is gradually taking place, and rural school improvement is definitely and systematically pursued. By an act of the Legislature of 1923, all towns were required to have their buildings in a sanitary and satisfactory condition by 1927. In 1914 the total enrollment was 146,620; in 1920, it had increased to 149,255, of whom 129,537 were enrolled in elementary schools and 19,718 in secondary schools. In 1922 the total enrollment was 159,790 (131,413 in elementary and 28,377 in high schools). The total expenditure for schools was about \$6,000,000 in 1920. The percentage of illiteracy in the State decreased from 4.7 in 1910 to 3.9 in 1920: among the native

white, from 1.5 per cent to 1.3; among the foreign-born whites, from 1.45 to 12.0; and among the negroes, from 10.3 to 68 per cent

Finance. See STATE FINANCES.

Political and Other Events. With the exception of one year, the Republicans continued to control the government of the State in the decade 1914-24. In 1916 Carl E. Milliken was nominated for governor by the Republicans, while Governor Curtis was renominated by the Democrats. For United States Senator, Frederick Hale received the Republican nomination and Charles F. Johnston the Democratic. The death of Senator Edwin C. Burleigh on June 16, 1916, made an extra primary election necessary to nominate his successor. Bert M. Fernald, a former governor, was nominated by the Republicans and Kenneth C. M. Sills, president of Bowdoin College, by the Democrats. In the September elections, Mr. Milliken was elected governor and Hale and Fernald United States Senators. In the presidential election in November, 1916, Charles E. Hughes received 69,506 votes, President Wilson, 64,118. The first national park east of the Mississippi, comprising 5000 acres, was created at Mt. Desert Island, in July, 1916. On Sept. 10, 1917, a woman suffrage amendment was defeated. At the same election an amendment was carried giving the governor the right to remove delinquent sheriffs. A budget system was inaugurated in this year. At elections held in 1918, Carl E. Milliken was reelected governor, and Senator Fernald was reelected to the Senate. The Republicans also elected a large majority of the members of the Legislature. In the presidential voting of 1920, W. G. Harding received 136,355 votes, J. M. Cox, 58,961. In 1920, elections were held for governor and other State officers. Frederick H. Parkhurst, Republican, was elected governor. Governor Parkhurst died on Jan. 31, 1921, 24 days after he had taken the oath of office, and was succeeded as governor by Percival P. Baxter, President of the Senate. In 1922 Governor Baxter was reelected, and Senator Hale was reelected to the Senate. The State Republican convention held in May, 1924, instructed its delegates to vote for President Coolidge.

Legislation. The most important acts of the Legislature in the decade 1914-24 are indicated below. The Legislature of 1914 amended the workmen's compensation law. A woman suffrage measure failed by a narrow margin to pass the House of Representatives. The liquor laws were amended in 1917. The Legislature in 1919 ratified the Federal Prohibition Amendment; made provision for the voting of women for president; and passed a measure providing for the registration of persons employed as counsels or agents to promote or oppose legislation. The Legislature of 1921 passed measures regulating the use of aircraft, extended the jurisdiction of the Public Utilities Commission over certain motor vehicles, amended the laws relating to teachers' pensions, amended the State prohibition law to harmonize with the Federal law, provided for the payment of a bonus to soldiers and sailors who fought in the war with Spain, and amended the workmen's compensation law. In 1923 the Legislature passed a bill to facilitate coöperative marketing of agricultural products and made it criminal conspiracy for two or more persons to conspire to sell liquor in violation of the law. In this period was developed a policy of improved highways, and bonds to the amount

of \$9,000,000 had been authorized and issued, under public referendum. In 1923, the State refused, by public referendum, to institute a 48-hour law for women and minors. The majority opposed was over 20,000. The State water-power policy instituted by Fernald, prohibiting transmission of hydroelectric power beyond the borders of Maine, was constantly under fire but was not changed in this period.

MAINE, UNIVERSITY OF A coeducational State institution at Orono, Me., founded in 1862. The university grew steadily during the years 1914-24, with 1058 students enrolled, 40,000 volumes in the library, and an income of \$396,000 at the beginning of that time, as compared with an enrollment of 1409 students, a library of 73,000 volumes, and an income of \$642,756 in 1923-24. The number of members of the faculty, including the staff of the experiment station, was increased from 126 in 1914 to 188 in 1924. A department of music was established in 1916. Clarence Cook Little succeeded Robert Judson Aley, LL.D., as president in 1922.

MALACCA. See STRAITS SETTLEMENTS.

MALACCA. During the ten years 1914-24, several features of interest in connection with malaria merit discussion. The War in Europe caused the disease to be carried to Great Britain and France after long years of immunity. It also drove home strongly the fact that malaria was still the world scourge which nullifies the efforts of man to civilize certain of the world's areas. The successful campaign against malaria in the temperate zones will not be repeated in the tropics until our knowledge of the disease has been increased. Quinine is powerless against certain types of tropical malaria, while the *anopheles* mosquito, which can be made the object of an intensive campaign of eradication in the United States, is not the sole means of distribution of the plasmodium in the tropics. Other insects are doubtless involved, of whose life cycle and habits little is known. Nor is tropical malaria the whole obstacle to its conquest. In some portions of the temperate zone the disease seems to attain increased virulence merely from the massing of troops, as in Saloniki during the War. Even in this latitude the disease behaved like tropical malaria, and not more than 20 per cent of the men responded to quinine; in this case, the infection probably proceeded from Egypt and could be classed as tropical. In regard to malaria in the United States, the work of the Rockefeller Foundation appears to show that the control of the disease is a matter simply of money and engineering. It is true that in rural sections the cost would be prohibitive and that systematic use of quinine must be added. This drug should be given in childhood and youth, for malaria is but infrequently contracted after this period.

MALAY STATES, FEDERATED. A federation of native states in the Malay Peninsula under British protection. The territory, made up of Perak, Selangor, Negri Sembilan, and Pahang, had an area of 27,506 square miles in 1921 and a population of 1,324,890. The 1911 population was 1,036,999. The 1921 population was composed of 510,821 Malays, 494,548 Chinese, 305,219 British Indians (172,465 in 1911), 5686 Europeans, and 3204 Eurasians. The chief town, Kuala Lumpur, had an estimated population of 80,000. Indian laborers continued to predominate on the estates. The leading activities centred in the rubber and tin industries. Coco-

nuts, rice, sugar, tapioca, pepper, and gambier were also cultivated. The country was little touched by the War and the succeeding depression, as the figures for trade indicate. Exports for 1910, 1920, 1921, 1922 were, in Straits dollars (1 S. dollar = \$0.56 normally), 102,851,990 dollars, 288,715,698, 129,463,762, and 135,116,634. Imports for the same years were 47,843,541 dollars, 170,522,123, 102,914,877, 78,666,032. Thus the balance of trade was consistently in favor of the Federation. Leading imports in 1922 were rice, machinery, cigarettes and tobacco, kerosene and motor oils, and cotton goods. The principal exports were rubber, tin ore, tin, and copra. In 1921, 3288 vessels of 1,713,382 tons entered, and 3289 vessels of 1,713,609 tons cleared ports of the Federated Malay States. Government accounts for 1911 and 1922 were: revenues, 35,056,244 and 52,494,110 dollars; expenditures, 24,680,723 and 49,811,007 dollars. The public debt on Jan. 1, 1922, was £4,759,907. In 1921 there were 1022 miles of railway in operation, compared with 614 miles in 1912, and 48 miles more under construction. The government scheme called for a network of railways over the whole peninsula.

MALAY STATES, NONFEDERATED. Five Malay states not included in the Federation. These were: (1) *Johore*, with an area of 7500 square miles in 1921; population, 282,244. The state greatly increased in population after 1911 and also progressed economically. Rubber, tin, and copra were the leading exports. Exports in 1921 and 1922 were Straits \$32,029,128 and \$37,861,597; imports were Straits \$24,730,135 and \$24,407,531. The government expenditure for 1922 was Straits \$5,785,873; revenue, \$8,625,223. (2) *Kedah* had an area of 3800 square miles and a population of 338,554. Chief articles of commerce were rice, rubber, coconut, tapioca. The tin mines were rapidly being exhausted. Exports in 1922 were \$6,844,127; imports, \$4,473,496. Government expenditure for 1922 was Straits \$5,290,239; revenue, \$4,966,904. (3) *Perlis* had an area of 316 square miles, and a population of 40,091. Leading products were rice, tin, and guano; the last two were declining. (4) *Kelantan* had an area of 5870 square miles and a population of 309,293. Agriculture was the leading activity; rice, rubber, and coconut raising ranked highest in importance. Rubber was the chief article of commerce. Exports in 1920, 1921, and 1922, were Straits \$6,206,642, \$2,848,171, and \$3,577,038; imports were \$5,679,510, \$4,108,595, and \$2,983,248. Valuable mining concessions, said to contain gold, galena, pyrites, and tin, were owned by British companies. State expenditures in 1921 and 1922 amounted to \$1,678,432 and \$1,539,318. (5) *Trengganu* had an area of 6000 square miles and a population of 153,002. Industries were similar to those of Kelantan. Exports in 1921 were Straits \$2,297,238; imports, \$2,574,946; in 1922, \$2,255,249 and \$2,287,158 respectively. State expenditures for 1921 and 1922 were \$759,054 and \$858,303. Tin and wolfram mines were worked. All the states had native sultans at whose courts resided British advisers representing Great Britain.

MALIPERO, FRANCESCO (1882-) An Italian composer, born at Venice. Although he began to study the violin at the age of six, his instruction was very desultory. Not until 1899 did he begin to study with interest and systematically at the Liceo Musicale in Venice, under

Enrico Bossi, whom he followed to Bologna (1902) on his becoming director of the Liceo there. After completing his studies, Malipero devoted himself entirely to composition. At different times he lived in Venice, Rome, Paris, and Asolo. His earliest compositions were influenced by Wagner, but these he himself destroyed. He adopted the principles of futurism, of which he is one of the leading exponents. Of his operas, *Elan e Fuldano*, *Canossa*, *Il Sogno d'un Tramonto d'Autunno*, *Pantea*, and a trilogy, *L'Orfeide* (*La Morte delle Maschere*, *Sette Canzoni*, and *Orfeo*), only two were produced, *Canossa* (Rome, 1914) and *Sette Canzoni* (Paris, 1920). For orchestra he wrote *Das Sepolcri*, *Dalle Alpi*, *Sinfonia delle Eroi*, *Sinfonia del Mare*, *Impressioni dal Vero* (two series), *Pause del Silenzio*, *Ditirambo Tragico*, *Illustrazioni di un Poema Cavalleresco*, *Armenia*, and *Sinfonia del Silenzio e della Morte*. His *Rispetti e Strambotti* for string quartet won the Berkshire prize (1920). He also wrote piano numbers.

MALMÉDY. See EUPEN, MALMÉDY, AND MOESNET.

MALTA. A British island colony in the Mediterranean Sea. The total area of Malta and its two islet dependencies is 118 square miles; civil population in 1921, 213,024, as compared with 211,864 in 1911. Agriculture was the chief activity. Leading products were wheat, barley, vegetables, grapes and other fruits, and cotton. Trade (excluding goods in transit) for 1913-14 and 1920 totaled £1,154,363 and £1,602,294 in exports, and £2,589,272 and £5,789,426 in imports. The state budget increased over the period 1913-21 from £423,108 in revenues and £402,521 for expenditures (1913-14), to £1,063,743 and £1,060,664 (1920-21). The British subvention for the latter year was £250,000. In 1921 a Maltese constitution was promulgated for the purpose of giving the natives a responsible government. A bicameral house was provided with its own local ministry. Certain "reserved" matters, however, including control of naval, military, and air forces, imperial interests, external trade, immigration, and treaties, were to be controlled by the governor and a nominated council. Valetta, the chief town, continued as an important port of call and the headquarters for the British Mediterranean fleet.

MALTA FEVER. See VETERINARY MEDICINE.

MAN, ANCIENT. See ANTHROPOLOGY.

MAN, ISLE OF. See GREAT BRITAIN.

MAN, PREHISTORIC RACES OF. For a long time zoologists, botanists, and geologists have taken evolution as a matter of course, not especially emphasizing the application of the theory to man himself. Latterly, unusual interest has been shown in the origin of man. The increasing importance of the human problem and the growing tendency to look upon human conduct as a biological phenomenon, has brought the question of man's origin to the fore and made a direct challenge to established beliefs. By gradual accumulation the scientific world has come into the possession of a respectable series of prehistoric skeletal remains, some of which cannot be satisfactorily explained save as forms intermediate to the primates in general. Anthropology has noted how the knowledge of man's past advanced step by step until we were in possession of evidence for a series of cultures ranging in unbroken succession from

the crudest Stone Age to modern times. Along with this, and somewhat parallel to it, can now be arranged successive biological or racial types of man.

As an introduction to the problem of prehistoric man the reader should have clearly in mind the time scale now recognized. According to the usual mode of reckoning we live in the Quaternary Age which was preceded by the Tertiary. These terms in simpler language signify the Age of Man and the Age of Mammals, respectively. The Quaternary has the subdivisions Recent and Pleistocene; the Tertiary splits into Pliocene, Miocene, Oligocene, and Eocene.

The Tertiary is estimated to have lasted three times the duration of the Quaternary to date. Primate forms, or monkeys, appear in the Eocene, but it is not until the Pleistocene that forms closely approximating the human are found. For an account of the discoveries down to 1914, see the article MAN, SCIENCE OF, in VOL XIV. In the decade 1914-24, we find the one outstanding discovery in the Old World to be that at Broken Hill, Rhodesia, Africa, in 1921. In this case, a large part of the skeleton was found, and fragments from the skeleton of at least one other individual. The brain case seems to be low-vaulted and indicative of low cranial capacity. The most striking feature, however, is the very large gorilla-like face. The teeth are large and the jaws massive. Even the Heidelberg jaw, truly massive, is inferior to that of the Rhodesian skull.

The skeleton, on the other hand, suggests an erect posture and straight legs similar to modern man. So just where this type will fall in relation to earlier finds remains to be seen, nor is it yet possible to state with exactness its geological age. Yet one important point is clear; viz., that this is one of the extinct forms of man and that it was found outside of Europe, thus extending the range of these early forms over Africa. Again, the face of this skull is the most primitive yet discovered, at least the most like the larger anthropoids.

Although *Pithecanthropus erectus* was discovered in 1891 by Dubois, the specimens were not made accessible to students until 1923. In consequence, they have been very carefully studied by a number of specialists, working independently. It appears that the brain capacity at first was somewhat underestimated; it was later rated at 985 cubic centimeters, which brings it much nearer the human level. It also became known for the first time that Dubois procured part of a lower jaw with teeth, which because of its location must be considered part of another individual, but apparently belonging to the same genus. The net result of this new information is to give added certainty to the existence of this genus and to increase the possibility of a Tertiary precursor who was able to begin the development of tools.

The outstanding event in this connection was the study of the Piltdown finds (see MAN, SCIENCE OF, in VOL XIV). The discovery was made by Dawson, but the study of the skull and the subsequent excavation of the site was carried on by Smith-Woodward, a well-known scientist. The skull was incomplete: part of the brain case, portions of the face, some teeth and half of a lower jaw. With these in hand a satisfactory reconstruction has been made, indicating a high or modern skull capacity, but a rather thick skull. The lower jaw, however, is decidedly

simian in appearance and so are the teeth, so much so that for a time some students regarded the jaw as not human and not belonging to the skull. The doubters were chiefly Americans, whereas English specialists who had better opportunities of examining the original specimen have consistently maintained that the jaw was not only human, but that it belonged to the same individual as did the skull. The chief difficulty throughout has been the inconsistency of a highly developed brain case, associated with an extremely primitive jaw, but this is no longer regarded as impossible or contrary to the evolutionary view.

A careful study of the specimen was made by G. Elliot Smith and Smith-Woodward, comparing it point by point with the other extinct types. For one thing, they assumed that since speech and handwork are the outstanding characteristics of modern man, these extinct types should show a marked development in the lateral portions of the brain case, under which are found the parts of the brain most intimately concerned. It is generally believed, for instance, that it was the expansion in this part of the brain case among the anthropoids that resulted in the modern type of human brain and head. When the subject is approached in this comparative way, all the cranial characters of the several extinct types of man fall readily and consistently into a series: first, *Pithecanthropus erectus*; next, Heidelberg man; then, in order of ascending development, the Rhodesian man, the Piltdown, the Neanderthal, and so on to modern man. The latest find of the period was made about two miles from the original Piltdown site. In this instance there came to light two fragments of the brain case and a molar tooth. One fragment, at least, overlaps one of the first find, so two individuals are represented. The tooth proves to be a molar from the lower jaw. The condition of these bones, the strata in which they were found, etc. are all in close agreement with the original Piltdown find; hence, there can be little doubt that in this totality the Piltdown finds represent two individuals of the same species. The significance of this last find is great, since it adds to the certainty that in the original the jaw and skull belong together. It has been almost impossible to come to a definite decision as to the geological position of the Piltdown find, because it lay near the surface in a slightly jumbled formation, yet the evidence favors the third interglacial period. This would, in fact, be consistent with the developmental sequence given above.

Turning now to new finds on the continent of Europe, we have only repetitions of Neanderthal and Cro-Magnon, nothing distinctively new. However, one of the recent finds promises to throw new light on the origin of modern man. It will be recalled that the first modern type of man to appear in Western Europe is that known as Cro-Magnon, first definitely associated with the palæolithic period by the discovery of a skeleton in the famous station of Solutré in 1868. Since that date similar skeletons have come to light, but in 1923 at the same station of Solutré, a new find was made by Depéret, Arcelin, and Mayet. In this case five skeletons were found. The burials had been made in an orderly manner and the graves marked with upright headstones. The artifacts accompanying these burials were considered of Aurignacian age. In stature these

individuals were tall, estimated at about 6 feet 5 inches. Perhaps the most important point of interest is that these skeletons represent a type of man rather more modern than the established Cro-Magnon type in that the faces are not so broad and the heads not pronouncedly dolichocephalic. This gives us at the first appearance of this type a less individualized example of the Cro-Magnon type, particularly in that the faces are not so wide, or like those of the American Indians, and so "disharmonic," since the head was not correspondingly narrow. All this raises the interesting question whether this latest find is a later form of this type and in consequence the ancestor of the white races of western Europe, or whether the disharmonic type was a later, more generalized and perhaps hybridized form which was eventually displaced.

There is, however, one possible exception to the statement that no earlier new forms were found upon the continent of Europe, since in 1914 the lower jaw of an adult was found at Ehringsdorf not far from Weimar and recently an incomplete skeleton of a child of approximately 10 years. In the opinion of some, these represent a type that belongs to a more remote period than the Neanderthal, seemingly most clearly resembling the Piltown specimen. Finally, mention should be made of the skeleton of a Neanderthal child discovered by Dr. Henry Martin at the station of La Quina. In this specimen the distinctively Neanderthal characters are fully pronounced, giving additional proof that the differentiation between Neanderthal and modern man is fundamental.

So far we have considered only Europe and Africa because with the single exception of *Pithecanthropus erectus* there have been no distinctive finds elsewhere. It does not follow, of course, that there will be none such, because both in Asia and America there have not been wanting signs of fair antiquity, but merely that they have not come to light. It is true that finds of great antiquity are frequently reported in the American press, but these have all failed to stand the examination. At least, so far no primitive remains have been found in the New World that would in any way compare with the Neanderthal. The inference therefore is that while man may have been in the New World for a very long time, he came here from the modern level. Differences in age, then, for ancient man in America must be determined largely by geological and archaeological criteria. However, there have been a number of finds whose claims to antiquity have not been completely demolished. Among these the most significant is that in Los Angeles, Cal., where early in 1924 fragmentary human remains and a few artifacts were found in strata that appeared to date back to the very beginning of the modern epoch, if not, in fact, the vanishing stage of the Pleistocene. It has, however, proved impossible to determine the precise geological horizon for this deposit, and since no associated fauna were found, the age of these remains is still doubtful. The skeletal features, on the other hand, are similar to those of California Indians.

Perhaps the greatest interest in this subject centres in the immediately prehuman types, one of which promises to be the fossil apes of the genus *Dryopithecus*, for some time known by fragmentary examples. In Europe, at least, *Dryopithecus* seems to have lived in the upper Miocene which would place this form on the

line of differentiation between the tree-living and the ground-living primates. Specifically, *Dryopithecus rhenanus*, the form known in Europe, is of large size and in a number of morphological characters lays strong claims to the rôle of man's precursor. In size it compares favorably with the gorilla, and in dentition it shows clearly the basic human tooth patterns. Again in 1923, Barnum Brown, a well-known palæontologist, from the American Museum of Natural History in New York, discovered parts of three jaws in the Siwalik Hills, India, which prove to belong to one or more species of *Dryopithecus*. The significance of this discovery is that the range of this genus corresponds to that of the primitive forms just discussed, *Pithecanthropus* in Java, the Heidelberg man in Europe. One might then draw upon a map of the world a line from Australia to England and consider this the axis to the distribution area for primitive man and his precursors, at least insofar as our knowledge goes.

Even in the New World traces of a large anthropoid primate have come to light. President Henry Fairfield Osborn of the American Museum in New York announced in 1922 the discovery of a molar tooth from fossil beds near Agate, Neb. In fact, this specimen was found by Harold J. Cook, an experienced geologist and palæontologist, while exploring fossil beds in the locality noted above. An exhaustive study of this tooth has been made by W. K. Gregory and Milo Hellman, the outcome of which supports the original determination of Professor Osborn that the finding of this tooth indicates the presence in the world of a new form of higher primate, falling between *Dryopithecus* on the one hand and *Pithecanthropus* on the other. Accordingly, the name *Hesperopithecus* has been assigned to this new type. The geological and palæontological setting of the deposit from which the tooth came suggests Upper Miocene or Lower Pliocene, and this again, on mere chronological grounds, places *Hesperopithecus* between *Dryopithecus* and *Pithecanthropus*.

The general significance of these discoveries lay in not only their revealing an ancient world-wide range for the higher primates, but in their supplying the intermediate structural forms needed to complete the evolutionary outline.

MAN, SCIENCE OF. See ANTHROPOLOGY; ETHNOGRAPHY, ETHNOLOGY; MAN, PREHISTORIC RACES OF.

MANCHURIA. A Chinese outer territory, with an approximate area of 363,700 square miles. Population estimates varied from 5,750,000 to 29,400,000. The most recent estimate, that of the Southern Manchuria Railway, put the population at 20,112,100, of whom nearly 90 per cent were Chinese. The capital and chief town, Mukden, had 158,132 inhabitants; the chief post was Dairen. Other large towns were Harbin (365,000), Newchwang (82,100), Kirin (540,214), Ying-k'ou (60,000), and An-tung (57,699). The extraordinary fertility of the soil and the improved railway facilities caused Manchuria to grow more rapidly than any other section of China. In 1921, it was estimated that 22,744,505 acres of land were under cultivation, worked by 19,461,100 people. The soya-bean, millet, kaoliang (a sort of sorghum), wheat, and rice were the principal crops. From 1912 to 1920, the kaoliang output increased from 3,807,740 to 6,733,000 tons; millet from 2,309,800 to 5,128,900 tons; barley from 364,369 to

1,552,000 tons. In 1910, 350,000 tons of soyabeans were exported; in 1920, 550,000 tons. In 1910, 250,000 tons of bean cake were exported; in 1920, 1,120,000 tons. Some idea of the advances made in mineral production may be gathered from the fact that coal mined in the Fushun mines, operated by the South Manchuria Railway, increased from 1,343,198 tons in 1911 to 3,237,400 tons in 1920. Gold, iron, salt, natural soda, and magnesite were also worked to some extent. The constant application of the principal concessionaire in the country, the South Manchuria Railway, to industrial activities met with excellent results. Whereas in 1907 there had been only 77 factories in the Kwantung leased territory, capitalized at 1,924,174 yen and turning out products valued at 2,681,808 yen, by 1918 there were 197 factories capitalized at 41,722,501 yen and producing 111,194,323 yen in commodities. Similarly, factories in the railway zone increased from 41 (capital, 2,448,265 yen) in 1912, to 131 (capital, 33,736,311 yen) in 1918. Principal works were bean mills, flour mills, sugar refineries, distilleries, and iron and steel factories. The trade of Manchuria reflected the same condition. Imports of foreign goods steadily increased from 72,431,345 taels in 1913 to 136,926,411 in 1921; exports from 94,053,423 to 196,820,680 in 1921. The following table shows exports from Dairen, in tons:

	1908	1914	1920
Beans	182,629	255,112	567,129
Bean cake	204,627	512,823	1,131,208
Cereals	13,781	118,259	707,237
Coal	7,703	559,761	212,589
Sundries	28,646	98,518	278,935
Bunker coal	15,276	247,193	195,428

The increasing rôle played by the United States in the Manchurian trade may be adduced from the following imports from the United States for 1910, 1919, and 1920, \$1,212,582, \$27,678,116, and \$15,871,554; exports for 1910, 1919, and 1920, \$8671, \$14,474,853, and \$16,514,377. The decline in 1921 (exports dropped to \$6,523,319) was due to the worldwide depression. The growth of the port of Dairen reflected the general advance. In 1908, 1357 vessels of 1,829,921 tons entered; in 1920, 2942 vessels of 4,864,904 tons; in 1921, 4592 of 6,328,734 tons. In 1920, American tonnage entering was 381,729, as compared with 421,028 British, and 3,408,369 Japanese. The increasing value of silver over the period 1914-24 necessarily contributed to the general well-being. From 1908 to 1915 the average value of the tael was \$0.67. In 1922 it was reported that more than 2220 miles of railway were in operation. These belonged to the following systems: South Manchuria Railway, 686 miles; Chinese (Government Railways, 522 miles; railways under Russo-Chinese management, 1078 miles. For history see CHINA; JAPAN.

MANDATES. The decision of the Paris Peace Conference (see PEACE CONFERENCE AND TREATIES) to establish a mandatory system under supervision of the League of Nations instead of permitting the outright annexation of the former German colonies and Turkish territories by the victorious Allies, resulted in the creation of a very significant and novel form of international control over colonial possessions. Colonies with an aggregate area about 1,250,000 square miles

and a total population of more than 15,000,000 were placed under mandates of the League of Nations, and well-informed observers have predicted that the system will ultimately be extended to other colonies. Article 22 of the Covenant which was prefaced to the five major peace treaties provided that certain territories taken from the defeated powers and "not yet able to stand by themselves" should be administered by more civilized nations acting as "mandatories" or trustees for the League of Nations, in which, presumably, ultimate sovereignty is vested. There were to be three classes of mandates: Class A, including territories taken from Turkey; Class B, including former German colonies in central Africa; and Class C, comprising German Southwest Africa and the former German island possessions in the Pacific. The principal Allied and Associated Powers, to whom these areas were ceded by Turkey and Germany, reserved the right to distribute the territories in question, and to draft the mandates, before turning the system over to the League for permanent operation. Accordingly, the Supreme Council on May 7 distributed the B and C mandates as follows: German East Africa to Great Britain, Togoland and the Cameroons (q.v.) to Great Britain and France, Southwest Africa to the Union of South Africa, Samoa to New Zealand, Nauru to the British Empire, German New Guinea to Australia, and German islands north of the equator to Japan.

There remained the A mandates. Because of the uncertainty regarding the Turkish peace settlement, these were not distributed until the the San Remo conference of premiers in April, 1920. The San Remo decision, confirmed on May 5, allotted Syria to France, and Palestine and Mesopotamia to Great Britain. It had been intended that Armenia also should become an A mandate, but as neither the United States nor any other power cared to assume responsibility for Armenia's welfare, no mandate was issued (see ARMENIA).

As the premiers at San Remo not only assigned the mandates but also sealed a compact for exclusive Anglo-French exploitation of the oil resources in Mesopotamia, the United States government immediately addressed a note of protest, May 12, 1920, to Great Britain, insisting on equal treatment for subjects of all nations. Refusing to be referred by Lord Curzon to the Council of the League (Curzon letter of August 9), the Washington government insisted on Nov. 20, 1920, that the drafts of mandates must be communicated to it for criticism before final approval, and that the United States had a just claim to all privileges, in regard to mandates, enjoyed by members of the League. The first point, it may be noted, was satisfied subsequently by preliminary publication of draft mandates; the second was guaranteed by special treaties which the United States later negotiated with individual mandatory powers. The United States also objected to the assignment of Yap (q.v.) to Japan, and not until the Washington Conference (q.v.) was this dispute settled by a special treaty recognizing the Japanese mandate for assuring the United States of cable and wireless facilities.

Meanwhile work proceeded on the drafts of the mandates, for each mandated territory was to be entrusted to the mandatory power only on a conditional basis laid down in a separate

charter or mandate, drafted by the chief Allied powers, but approved and granted by the League Council. The C mandates, offering the least difficulty, were first formulated and received the Council's stamp of approval on Dec. 17, 1920. These were five in number: Union of South Africa mandate for former German Southwest Africa, Australian mandate for New Guinea, New Zealand mandate for western Samoa, British Empire mandate for Nauru Island, and Japanese mandate for the Caroline and Marshall Islands. In each of these territories the mandatory power was authorized to exercise full power of administration and legislation, subject to reservations for the prohibition of slavery and forced labor, of the arms and liquor traffic, of fortifications and military training of natives save for local defense, and subject also to a guarantee of religious freedom. Japan would gladly have added a provision for the open door, but the other powers, especially the Australasian Dominions, unwilling to throw their Pacific mandates open to Japan, refused. Difficulties with the Holy See regarding the Palestine mandate, and with the United States regarding Mesopotamia, delayed the definitive approval of the other mandates. On Aug. 1, 1922, the Council approved B mandates for northern Cameroon (British), southern Cameroon (French), western Togoland (British), eastern Togoland (French), Ruanda and Urundi (Belgian), and East Africa or Tanganyika Territory (British). A notable feature of these mandates was the inclusion of elaborate provisions for the welfare of the natives, the abolition of slavery, and equality of commercial and industrial opportunity in these territories among members of the League, in addition to the stipulations contained in the C mandates. The A mandates for Palestine (British) and Syria and Lebanon (French) were approved on July 24, 1922, and published by the League on August 12; that for Mesopotamia had long been drafted but had aroused so much international difficulty and was so vitally dependent on British relations with the natives that its confirmation was delayed (see MESOPOTAMIA.) The A mandates were particularly interesting; they were designed to be transitional measures to assist backward countries until fit for independence. Special provisions were inserted for the development of autonomy and for the protection of "antiquities" or archaeological remains.

All mandates imposed on the mandatory power the obligation to make regular reports of its administration to a Permanent Mandates Commission appointed by the League. This is undoubtedly the most unusual and the most valuable feature of the entire system; the knowledge that such reports will receive full publicity and open discussion has acted as a potent stimulus to good administration. Under the direction of Professor Rappard a special section of the League secretariat at Geneva has made a most thorough study of the voluminous reports, in order to provide the commission with some authoritative data. Two instances of the work of the Mandates Commission may illustrate the value of this work. At the 1922 meeting it developed that the frontier between the Belgian and British mandates in East Africa caused considerable hardship to the natives, because it was drawn regardless of tribal frontiers; in consequence of the Commission's recommendation, Belgium and Great Britain agreed to mod-

ify the frontier. Again, the imposition of a heavy dog tax on natives of Southwest Africa caused the Bondelzwarts rebellion of 1922, which was ruthlessly suppressed by the Union of South Africa; a Haitian delegate brought the matter before the Commission, and South Africa was severely criticized for its native policy, with the result that the policy was modified. Full information regarding the mandates and their administration is made available by the League of Nations in its publications containing minutes of the Mandates Commission and supplementary official documents. See AFRICA, LEAGUE OF NATIONS.

MANGIN, CHARLES MARIE EMMANUEL (1880-1925). A French soldier, born in Sarrebourg, Moselle. He served on the staff of Marchand's Fashoda mission in 1897 and played a prominent part in the conquest of Morocco from 1911 to 1913. In the latter year he was made brigadier-general. In the great War he commanded a division at the battle of the Marne and by his personal example of courage saved a threatening situation. He commanded at Verdun, where in March, 1916, he recaptured the fortresses Douaumont and Vaux. In the defensive of April, 1917, his tactics were criticized and an inquiry was held. He was exonerated. In July, 1918, he defeated the Germans north of Château-Thierry and forced them to retreat. During these operations he had under his command important American forces. Following the Armistice, he commanded the Allied Army of Occupation, with headquarters at Mayence. He was the organizer of the French "black army."

MANITOBA. A Canadian province with an area of 251,832 square miles; population in 1911, 461,394; in 1921, 610,118, an increase of 32.2 per cent. The rural population in 1921 made up 57.1 per cent of the whole, as compared with 56.6 per cent of 1911. Males, in 1921, continued in excess of females, the division being 320,567 to 289,551. The leading cities, with their populations in 1921, were Winnipeg, the capital, 179,087 (136,035 in 1911); Brandon, 15,397; St. Boniface, 12,821; Portage la Prairie, 6766. In 1916 settlers of American origin numbered 18,274. There were, besides the settlers of British descent, large colonies of German, Austro-Hungarian, and Russian farmers in the province.

Industry. To a large extent, the province's very rich natural resources remained undeveloped. The population was settled in the agricultural districts of the West and South, and as farming and pastoral pursuits were the leading activities, little attention was given to the forests, fishing grounds, water power, or mineral deposits. The characteristic of the period was the spread of diversified farming. The area under field crops in 1923 was 6,719,522 acres. The acreage under spring wheat in 1923 (2,915,915 acres) was less than that of 1911 (3,094,833 acres). Oats in 1922 were planted on 1,834,504 acres. Barley, rye, flax, and root crops showed considerable increases, and so did the forage crops. The total value of field crops in 1923 was \$60,706,700. The augmentation of the live stock indicated the new interest of the province. Cattle in 1923 numbered 691,711, against 409,718 in 1913; sheep in 1923 were 93,162, against 42,840 in 1913; swine in 1922 were 291,236 against 184,745 in 1913. In 1922, 51 dairy establishments produced a product

value of \$12,434,233 as against the total output of \$593,375 in 1910. Mineral areas included rich gold fields in The Pas district and at Elbow Lake; copper ore in the Flin Flon district; gypsum, and building materials. The total mineral production in 1922 was \$2,258,942. Other products yielded: furs, 1921-22, more than \$1,690,278, fish in 1921, \$1,023,187; lumber cut, 1921, \$1,398,067. In 1921 there were 1965 industrial establishments; meat packing, milling, etc., was the most important, capitalized at 100,441,542 and employing 20,732 workers (17,325 in 1910). Materials used were valued at \$68,216,070 and the product at \$123,470,393: in 1910 the product had been \$53,673,609. Out of the 3,270,491 horse power estimated as available, in 1923, 134,025 was being used.

Communications. In 1922 there were in operation 4585 miles of railway as compared with 3993 miles in 1913. The telephone system, provincially owned, had 240,186 miles of line in 1921. There were 68,463 telephones on the lines, 14,956 of which were rural. The Dominion railway from The Pas to Port Nelson (Hudson Bay), to make possible wheat shipments via Hudson Bay, was still under construction.

Government. Revenues and expenditures for 1913 were \$5,788,070 and \$5,314,849; for 1922, \$7,940,457 and \$8,381,667. The gross debt in 1922 was \$62,000,000, of which 75 per cent had been expended in the telephone system, public buildings, and roads. The Dominion subsidy for 1922 was \$1,470,991, and receipts from Dominion school lands, \$286,346. In 1922 there were 136,876 pupils in the 3782 public schools. The enrollment had been 83,679 in 1913. The University of Manitoba had 1570 students in 1921; the Agricultural College, 1124 students. The provincial budget in 1922 carried \$1,399,759 for education; in 1913, this had been \$668,832. Total expenditures for education in 1913 were \$5,036,795; in 1922, \$13,564,824. The province was represented by six members in the Senate and 15 in the House of Commons of the Dominion Parliament. Women were permitted to stand for Parliament. Proportional representation was adopted as the method for choosing the representatives for the city of Winnipeg.

MANLY, CHARLES MATTHEWS (1876-). An American mechanical engineer, born at Staunton, Va., and educated at Furman University and Cornell. After graduation he became assistant to Secretary Langley of the Smithsonian Institution in his work on aviation and built and piloted the first Langley aeroplane in 1903. He organized the Manly Drive Company in New York in 1905 and was its chief engineer, thereafter serving as consulting engineer to various corporations and to the British War Office (1915) in the development of large aeroplanes in the United States. During 1915-20 he was associated with the Curtis Aeroplane and Motor Corporation but later devoted his attention chiefly to consulting practice under Manly and Veal. He patented nearly 50 inventions in automotive transportation, power generation, and transmission. In 1918 he was a member of the United States Commission to the International Aircraft Standards Conference in London. He was associated with S. P. Langley in the production of his *Memoirs on Mechanical Flight* (1911).

MANN, ALBERT RUSSELL (1880-). An American agricultural educator, born at Haw-

kins, Pa., and educated at the New York State College of Agriculture and the University of Chicago. In 1908 he was appointed assistant professor of dairy industry at New York State College and in the same year was secretary of the State Commission of Agriculture. He was successively secretary, registrar and editor, professor of rural social organizations, acting dean, and dean (from 1917) of the New York State College of Agriculture. He was also director of the Cornell University Agricultural Experiment Station and director of extension work. He was a member of many scientific societies and the author of *Beginnings in Agriculture* (1911).

MANN, JAMES ROBERT (1856-1922) An American legislator (see Vol. XV). He was reelected to Congress for successive terms from 1903 to 1923. He was minority leader from the 62nd to the 65th Congress and was Republican leader up to the time of his death. He was recognized as one of the most efficient parliamentarians in the House and was perhaps its most conspicuous member for many years. He was a candidate for Speaker in 1922 but was defeated by Fred H. Gillett of Massachusetts.

MANNING, WILLIAM THOMAS (1860-) A Protestant Episcopal bishop (see Vol. XV). He was rector of Trinity parish from 1908 to 1921. In the latter year he was consecrated bishop of New York. During the War he served as volunteer chaplain at Camp Upton. He was a chevalier of the Legion of Honor of France and an officer of the Order of the Crown of Belgium. From 1922 to 1924 he was much in the public eye on account of controversies with the Rev. Percy Stickney Grant, because of his radicalism, and with the Rev. William Norman Guthrie, because of dancing and other innovations at his religious services in St. Marks-in-the-Bouwerie, New York City.

MANOURY, MICHEL JOSEPH (1847-1923). A French general, born at Maintenon, and educated at the Ecole Polytechnique in Paris. He served in the Franco-Prussian War of 1870 and was general of a division in 1905. In the latter year he received the command of the artillery of the forts of Paris and was president of the Commission of Military Schools. He commanded the 14th Army Corps at Marseilles in 1908 and the 20th at Nancy in 1909; in 1910 he was appointed military governor of Paris and a member of the special council of war. In 1914 he was placed in command of the French Reserve Force near Paris, and it was his successful attack on September 6 which first checked General Von Kluck's drive toward Paris. He was wounded at Soissons in March, 1915. He died at Orléans, France, in 1923.

MANSFIELD, KATHERINE (c. 1890-1923) (Mrs. JOHN MIDDLETON MURBY). An English writer, born in New Zealand. She began writing at an early age and soon won her way to the front rank among contemporary writers of fiction. In 1913 she married John Middleton Murry. Her book of short stories, *Bliss and Other Stories*, published in 1920, won much favorable comment. This was followed by *The Garden Party and Other Stories* (1922). A posthumous book of poems was published in 1924.

MANSHIP, PAUL (1885-). An American sculptor, born in St. Paul, Minn. He studied art in New York and Philadelphia, and in 1909, winning a scholarship of the American

SCULPTURE

FROM THE METROPOLITAN MUSEUM OF ART, NEW YORK

"PAULINE"

PAUL MANSHIP

Academy in Rome, he went to Europe for three years. In Europe he studied the work of Michelangelo and Donatello and found inspiration in Greek art. He was also influenced by the art of India. His debt to Greece may be traced in such pieces as "The Centaur and the Dryad," "Briseis," the "Infant Hercules" fountain made for the courtyard of the American Academy at Rome, "The Lyric Muse" and "The Little Brother." The beautiful patina of these pieces is a peculiarity of Manship's work. His gleanings from Hindu and Buddhist sculpture are seen in "The Dancer and Gazelles" and the "Flight of Night." While there is reverence for tradition in Mr. Manship's sculpture, there are also very modern notes in some of his figures, e.g. "Yawning." In 1914 he was elected an Associate of the National Academy; two years later he was made a full member. Among his works are the J. P. Morgan memorial at the Metropolitan Museum in New York City; the Civic Forum medal, and "Dancing Girl and Fauns" and "Indian and Prong-Horn Antelope" at the Art Institute, Chicago. The bronze statuette, "Yawning," is at the St. Paul Institute, and the portrait study of his daughter, "Pauline," is in the Metropolitan Museum. The group, "Dancers and Gazelles," was exhibited at the Luxembourg in Paris and also at the Corcoran Art Gallery, Washington and the Cleveland Museum. Copies of "Centaur and Dryad" are at the Metropolitan and at the Detroit Institute of Arts.

MANTLE, BURNS (1873-). An American newspaper writer, born in Watertown, N. Y. He became dramatic editor of *The Daily News* (New York) and dramatic correspondent of the *Chicago Tribune* in 1922. He was previously dramatic editor of *The Evening Mail* (New York) and Sunday editor of the *Chicago Tribune*. He was best known as the editor of *The Best Plays and Year Book of the Drama in America* (from 1919).

MANUFACTURES. See **BOOTS AND SHOES**; **IRON AND STEEL**; **LEATHER**, **MOTOR VEHICLES**; **PAPER AND WOOD PULP**; **PETROLEUM**; **RUBBER**; **SILK**; **SILK, ARTIFICIAL**, **TEXTILE MANUFACTURING**; **UNITED STATES, Manufactures**.

MANURES. See **FERTILIZERS**.

MANZ, GUSTAV (1868-). A German writer and editor of the *Tagliche Rundschau* of Berlin. He was a popular lecturer and was on the staff of the Lessing Hochschule of Berlin. He is the author of *M. Beer* (1892); *Das Tagebuch* (1893); *Das Lebende Wort* (1913); *Hundert Jahre Berliner Humors* (1916), and *Martin Luther im Deutschen Wort und Lied* (1917). He also edited Emil Gott's *Verbotene Früchte* (1894) and *Briefe an einen Freund* (1919), works by Möricke (1912), Scheffel's *Ekkehard* (1916), *Selected Writings of Theodor Storm* (1917), and Friedrich Vischer's *Luch Einer*.

MARCH, PEYTON CONWAY (1864-). An American soldier, born in Easton, Pa. He graduated from the United States Military Academy in 1888 and in the same year was commissioned 2d lieutenant in the artillery. He saw service in the Philippines in military operations and later as administrator. From 1903 to 1907 he was a member of the General Staff in the Army and in 1904 was observer in the Russo-Japanese War. He commanded the artillery branch of the American Expeditionary Forces from the outbreak of the War until 1918, when he was appointed acting chief of staff.

On May 20, 1918, he became general and chief of staff and held that position throughout the remainder of the War. He was awarded the Distinguished Service Medal and decorations of England, France, and other European countries.

MARCONI, GUGLIELMO (1874-). An Italian electrical engineer (see Vol. XV). During 1922-24 he was experimenting on new methods of transmission by which energy might be centralized in one direction and made to go in a straight line from one station to another. He made successful experiments in sending radio messages from Cape Verde to Cornwall, a distance of 2200 miles. During 1924 he was successfully experimenting with the reduction of power required for transmission of radio messages. See **RADIO TELEGRAPHY AND TELEPHONY**.

MARCOSSON, ISAAC FRIDERICK (1877-). An American editor, born at Louisville, Ky., and educated in the schools of Louisville. From 1894 to 1903 he was on the staff of *The Louisville Times*. In 1903 he became associate editor of *The World's Work*, with which he continued until 1907, when he became a member of the staff and financial editor of the *Saturday Evening Post*. From 1910 to 1913 he was editor of *Munsey's Magazine*. During and following the War he traveled about Europe and other parts of the world to investigate conditions and contributed articles to the *Saturday Evening Post* and other periodicals. He wrote: *The War After the War* (1916); *The Rebirth of Russia* (1917); *The Business of War* (1917); *Adventures in Interviewing* (1919); and *An African Adventure* (1921). He was the author, with Daniel Frohman, of *Charles Frohman, Manager and Man* (1917).

MARIANNE or LADRONE ISLANDS. See **PACIFIC OCEAN ISLANDS**.

MARIENWERDER. See **ALLENSTEIN-MARIENWERDER**.

MARIETTA COLLEGE. A nonsectarian, coeducational institution at Marietta, Ohio, founded in 1835. The enrollment of the college increased from 200 in 1914 to approximately 310, exclusive of extension students, in 1923-24. The faculty increased during the period 1914-24 from 19 to 26, the library from 60,000 to 84,500 volumes, and the productive funds from \$700,000 to \$1,120,000 through an endowment campaign in 1921. A department of geology was established in 1919, and the entrance requirements were raised in the fall of 1922. Edward Smith Parsons succeeded G. W. Hinman as president in 1919.

MARINE, MERCHANT. See **SHIPPING**; **SHIP-BUILDING**; etc.

MARINE CORPS, UNITED STATES. During the great War the Marine Corps served on vessels of the fleet, and on shore in France, Haiti, Santo Domingo, Nicaragua, Cuba, Peking, the Azore Islands and at naval stations at home and abroad. The Fourth and Fifth Brigades of marines and 12 replacement battalions served with the American Expeditionary Forces in France, and the First Marine Aviation Squadron with the northern bombing group in France.

The Fifth Regiment of Marines landed in France with the first expedition of American troops in June, 1917; with the Sixth Regiment of Marines and the Sixth Machine Gun Battalion of Marines it formed the Fourth Infantry Brigade of the Second Division, United States Army. This division was the first one ready

for service on the fighting line, and the remarkable work of the Fourth Brigade of Marines around Château-Thierry and in Belleau Wood gave the Corps world-wide fame. The regular strength of this brigade was 258 officers and 8211 enlisted men. During its service in France, chiefly between March 15, and November 11, 1918, its casualties were:—killed in action or died of wounds received in action, 2457; wounded, 8898; total, 11,355, almost 3000 more than the total number of officers and men at any one time. The authorized strength of the Corps in 1924 was 1093 commissioned officers, 158 warrant officers, and 19,500 men.

MARINE ENGINES. See SHIPBUILDING.

MARINUZZI, GINO (1882–). An Italian conductor and composer, born at Palermo. After completing his studies at the Conservatory in Palermo he was conductor at various theatres in Italy and made frequent appearances as guest conductor in Paris, Madrid, and Buenos Aires. From 1919 to 1921 he was with the Chicago Opera Association. In 1922 he became principal conductor at the Teatro Regio in Turin. He composed the operas, *Il Mogno del Poeta* (Palermo, 1889), *Barberina* (ib., 1903) and *Jaquerie* (Buenos Aires, 1918, Chicago, 1920). He also wrote a symphonic poem, *Sicania*, and an orchestral suite, *Siciliana*.

MARITIME REPUBLIC. See SIBERIA AND THE FAR EASTERN REPUBLIC.

MARKETING. See AGRICULTURE, HORTICULTURE.

MARNE, BATTLES OF THE. See WAR IN EUROPE, *Western Front*.

MARQUESAS ISLANDS. See PACIFIC OCEAN ISLANDS.

MARQUETTE UNIVERSITY. An institution under Roman Catholic direction at Milwaukee, Wis., founded in 1907. The student enrollment increased in the decade between 1914 and 1923–24 from 1157 to 3925, of which 330 were women. The number of members in the faculty rose from 254 to 330, and the number of volumes in the library from 30,000 to 75,000. In 1918 the university received \$333,333 from the Carnegie Foundation and in 1922 \$400,000 under the will of Mrs. Harriet Cramer. A gymnasium and a new building for the College of Dentistry were built, and a new science building and law building were under construction in 1924. Rev. Albert C. Fox, S.J., LL.D., succeeded the Rev. Herbert C. Noonan, S.J., M.A., as president in 1922.

MARQUIS, DONALD ROBERT PERRY (1878–). An American newspaper writer and author, born at Walnut, Ill. For several years he was associated with Joel Chandler Harris in editorial work in Atlanta, Ga. Moving to New York, he wrote the *Sun Dial* column in the *New York Evening Sun*. In its conduct he achieved a distinctive reputation as a wit and philosopher. He gave it up to become director of a column in the *New York Tribune* in 1923. His writings include: *Hermione* (1916); *Prefaces* (1919); *The Old Soak*, a play (1921); *Carter and Other People* (1921); *Noah an' Jonah an' Cap'n John Smith*, poems (1921); *Poems and Portraits* (1922); *Revolt of the Oyster* (1922); *Sonnets to a Red-haired Lady* (1922); and *The Old Soak's History of the World* (1924).

MARRIAGE. See EUGENICS.

MARSAL, FRÉDÉRIC FRANÇOIS (1874–).

A French politician, born in Paris, and educated at the French universities. He pursued a military and political career. Recipient of many decorations, he wrote numerous books on finance and political economy. He was minister of finance in the governments of Millerand, Leygues, and Briand (1920–22) and again in 1924 in the reorganization of the Poincaré cabinet. He floated the great peace loan of 1920 and took measures to consolidate the floating debt of the French Republic, which in 1924 amounted to 70,000,000,000 francs. After the Radical victory in the 1924 elections, Marsal was chosen by President Millerand to read his message to Parliament, but the Radical majority in the Chamber refused to accept any cabinet named by the nationalistic French president.

MARSEILLES-RHONE CANAL. See CANALS.

MARSHALL, LOUIS (1856–). An American lawyer and publicist (see Vol. XV). He took part in many arbitrations and mediations between employers and laborers and was a member of the arbitration board which settled the New York clothing workers' strike in 1919. He was also chairman of the commission to fix the price of bread and secured the enactment of laws regulating private and foreign bankers and other reform legislation. In 1920–21 he was president of the Jewish Relief Committee which collected more than \$50,000,000 for relief of Jewish war sufferers. He was also a member of the international committee whose efforts resulted in treaties with Poland, Rumania, Jugo-Slavia, Czecho-Slovakia, and other countries, to guarantee equal rights to racial, religious, and linguistic minorities.

MARSHALL ISLANDS. See PACIFIC OCEAN ISLANDS.

MARTIN, EVERETT DEAN (1880–). An American sociologist, born at Jacksonville, Ill., and educated at Illinois College in Jacksonville and at McCormick Theological Seminary. In 1907 he was ordained to the Congregational ministry and served as pastor in several churches in Illinois. From 1910 to 1914 he was pastor of the Unitarian church in Des Moines, Iowa, and from 1916, lecturer on social philosophy at the People's Institute, New York. He was assistant director and secretary from the latter year of the Cooper Union Forum and acting director in 1921–22. He founded the People's School of Philosophy, lectured on social psychology at the New School for Social Research (1922), and was chairman of the National Board of Review of Motion Pictures. His book, *The Behavior of Crowds* (1920), attracted attention.

MARTIN, GLENN L (1886–). An American airplane manufacturer, born at Macksburg, Iowa. In 1907 he began to build gliders and in the next year designed and built the pusher type of airplane. In 1909 he established one of the first airplane factories in the United States and built monoplanes, water aircraft, etc. He gave many exhibition flights in Canada and the United States and in 1912 moved his factory to Los Angeles. The War Department ordered his model TT in 1913, and later the Army adopted it for training purposes. From 1914–16 he built for the government of Holland and produced several new models for the United States Army. In 1917 he organized his own company at Cleveland and began designing and building the Martin

bomber, the first American-designed airplane for Liberty engines

MARTIN, HELEN REIMENSNYDER (1868-). An American author (see VOL XV). Her later books include *Those Fitzenbergers* (1917); *Gertie Swartz: Fanatic or Christian?* (1918); *Maggie of Virginsburg* (1918); *The Schoolmaster of Hessville* (1920); and *The Marriage of Susan* (1921).

MARTINELLI, GIOVANNI (1885-). An Italian operatic tenor, born at Montagnana. He began his musical career as a clarinet player in an Italian regiment and later studied singing with Mandolini. He made his debut in Verdi's *Ernani* in Milan (1910). In 1912 he sang at Covent Garden, and in 1913 he became one of the leading tenors at the Metropolitan Opera House, where, after the death of Caruso, he succeeded to many of the latter's rôles. He was also heard in Rome and Buenos Aires.

MARTINIQUE. An island colony of France, located in the Lesser Antilles in the West Indies. Its area is 385 square miles; population in 1923, 244,439. The chief commercial town was Fort-de-France, with a population of 26,399. The population was almost wholly Creole except for the considerable number of British Indian, Chinese, and African laborers. Sugar, rum, and cocoa remained the chief products. The sugar export, which reached 40,000 tons before the War, dropped to 16,460 tons in 1920. The 1921 figures show an increase to 24,213 tons. Rum exports in 1921 totaled 14,950,800 litres. Exports for 1913, 1920, and 1921 were 28,896,814 francs, 128,953,479, and 89,110,544. Imports for the same years were 22,144,315 francs, 132,186,517, and 84,508,370. France took nine-tenths of the exports and sent one-third of the total imports in 1920. That the increase in the trade was real, in spite of the depression of the franc, may be seen by the fact that the rum exports increased from 18,821,900 litres in 1913 to 33,109,100 litres in 1919, and 22,449,300 litres in 1920. Similarly, in 1911, 88 vessels of 156,000 tons entered Martinique ports, while in 1919, 766 vessels of 341,206 tons entered. The budget of 1924 carried 22,100,000 francs for expenses, and for receipts, 21,400,000. The deficiency was to be covered by an advance of 700,000 francs from the reserve fund.

MARX, WILLIAM (1863-). A German statesman, born in Cologne. He studied law and became well-known as a jurist. He was long active in the Clerical Party and served in the Prussian Diet. He was for 12 years a member of the Reichstag, and on Nov. 2, 1922, was appointed chancellor, succeeding Gustav Stresemann. He carried on the difficult affairs of the government in 1922, 1923, and 1924 and attended several of the most important conferences on reparations and other questions, including the conference on the Dawes Plan in London in August, 1924. Largely through his efforts, an agreement was finally obtained on the Dawes Plan. See GERMANY, *History*.

MARYLAND. Maryland is the forty-first State in size (12,327 square miles), and the twenty-eighth in population; capital, Annapolis. The population increased from 1,295,346 in 1910 to 1,449,661 in 1920, a gain of 11.9 per cent. The white population rose from 1,062,639 to 1,204,737; negro, from 232,250 to 244,479; native white, from 958,465 to 1,102,560. The foreign-born white population fell from 104,174

to 102,177. The urban population was 658,192 in 1910, 869,422 in 1920; while the rural population decreased in the decade from 637,154 to 580,239. The growth of the principal cities was as follows: Baltimore (q.v.), 1910, 558,485, 1920, 733,826; Cumberland, 21,839 to 29,837, Hagerstown, 16,507 to 28,064.

Agriculture. While the population of the State increased 11.9 per cent in the decade 1910-20, there was a decline in rural population from 50 per cent of the total in 1900 to 40 per cent in 1920. The number of farms decreased 2.1 per cent from 48,923 in 1910 to 47,908 in 1920, and the area in farms decreased 5.9 per cent, from 5,057,140 acres to 4,757,999; and the improved land in farms, from 3,354,767 acres to 3,136,728. The total value of farm property showed an apparent increase, from \$286,167,028 in 1910 to \$463,638,120 in 1920, the average value per farm, from \$5849 to \$9678. In interpreting these values, and indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration; the index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes decreased from 79.5 per cent in 1910 to 74.8 per cent in 1920. Of the total of 47,908 farms in 1920, 32,805 were operated by their owners, 1262 by managers, and 13,841 by tenants. The comparative figures for 1910 were 33,519, 988, and 14,416. White farmers in 1920 numbered 41,699, compared with 42,551 in 1910; colored, 6209, compared with 6372. The farms free from mortgage in 1920 were 19,292, compared with 21,084 in 1910, those under mortgage numbered 11,339 and 12,127 in those years. The number of dairy cows in 1920 was 188,537, compared with 166,859 in 1910; "beef cows," 13,704, compared with 18,816; mules, 32,621, compared with 22,367; swine, 306,452, compared with 301,583; sheep, 103,027, compared with 126,251. The estimated production of the chief farm crops in 1923 was as follows: corn, 23,580,000 bushels; wheat, 10,426,000; oats, 1,550,000; barley, 121,000; potatoes, 3,897,000; sweet potatoes, 1,036,000; tobacco, 27,489,000 pounds, hay, 362,000 tons; apples, 2,046,000 bushels; peaches, 631,000; and pears, 335,000. Comparative figures for 1913 are corn, 22,110,000 bushels; wheat, 8,113,000; oats, 1,260,000; barley, 145,000; potatoes, 3,741,000; hay, 491,000 tons; and tobacco, 18,500,000 pounds.

Manufactures. Maryland is an important manufacturing State. There were in the State in 1909 4837 manufacturing establishments; in 1914, 4797; and in 1919, 4937. Persons engaged in manufacture numbered 125,489, 131,391, and 165,875; and capital invested amounted to \$251,226,828, \$293,210,925, and \$619,600,983, in those years. The products in 1909 were valued at \$315,669,150; in 1914, \$377,749,078, and in 1919, \$873,944,774. The large increase in the value of the products between 1914 and 1919 was largely due to the change in industrial conditions brought about by the War and cannot properly be used to measure the growth of production during the census period 1914-19; but the increase in number of establishments and in number of wage earners clearly indicates a decided increase in the value of manufactures. The manufacture of men's clothing ranks first in value of product: in 1909,

\$36,921,000, in 1914, \$39,048,000, and in 1919, \$72,589,000. Shipbuilding ranks second, with \$3,535,000 in 1909; \$4,521,000 in 1914; and \$67,310,000 in 1919; the extraordinary growth in the value of this product is due chiefly to the increase in shipbuilding during the War. Slaughtering and meat packing, in third place, had products valued in 1909 at \$13,683,000; in 1914, \$17,100,000, and in 1919, \$43,228,000. Fertilizers to the value of \$9,673,000 were manufactured in 1909; \$13,987,000 in 1914; and \$37,014,000 in 1919. The chief manufacturing city of the State is Baltimore, having in 1909 2502 manufacturing establishments, with a product valued at \$186,978,000; in 1914, 2502 with \$215,172,000; and in 1919, 2797 with \$677,878,000. In Hagerstown there were 76 establishments, with a product valued at \$3,197,000; in 1914, 113 with \$7,412,000; and in 1919, 122 with \$17,663,000. Other important manufacturing cities are Cumberland and Frederick.

Education. The educational problems of Maryland include a large rural population and a large colored population. Marked improvement was made both in administration and development of the school system during the decade 1914-24. In 1916 the school system was reorganized, and the issuing of teachers' certifications was made a State function. An equalization fund was established enabling every county to pay the State minimum salaries on a reasonable local tax rate for schools but without forbidding the county to pay more than the minimum if it so desires, by levying the tax rate above \$.67. This fund made it possible to secure a total salary increase for well-trained teachers of almost \$500,000, ranging from \$150 to \$700 per teacher. An extensive and intensive school campaign was carried on in 1921-22, as a result of which the people of Maryland became fairly familiar with the needs of the schools and the manner in which these needs might be met. The chief efforts were being directed to the organization, administration, and supervision of schools: to securing larger attendance at the State normal schools; establishing extension courses for teachers during the school year at State expense; promoting attendance at summer schools; and carrying out the provisions of the law passed in 1922 for more efficient supervision of both town and rural schools. Vocational education was carried on after 1917, and in 1921-22, 2240 pupils were enrolled in vocational courses, which was equivalent to one-sixth of the entire enrollment of the State outside of the city of Baltimore. All types of instruction which had developed in the national programme, except industrial rehabilitation, were in operation in Maryland. The total enrollment in the white elementary schools in 1921-22 was 183,296; in the white high schools, 20,127; a total white enrollment of 208,425. In the elementary schools for colored pupils were enrolled 46,573; in the high schools, 1392; a total colored enrollment of 47,965. The total enrollment in all schools, both white and colored, was 256,390, as compared with 237,125 in 1913. The percentage of illiteracy in the State was 8.7 in 1910 and 6.8 in 1920. Among the native white population it decreased from 3.7 to 2.5; among the foreign-born, from 12.3 to 14.3; and among the negro, from 28.6 per cent to 22.2.

Finance. For finance see STATE FINANCES.

Political and Other Events. Maryland is

usually reckoned Democratic, but in the decade 1914-24 there were marked fluctuations of power between Democrats and Republicans. In 1914, John Walter Smith, Democrat, was re-elected to the United States Senate, defeating Edward C. Carrington, Jr., Republican, the Democrats elected five members of the House of Representatives, and the Republicans one. In September of that year, the hundredth anniversary of the defeat of the British at North Point in Baltimore and of Francis Scott Key's writing of "The Star-Spangled Banner" during the British bombardment, was celebrated. In May, 1915, municipal elections in Baltimore, having approximately half the State's population, were won by the Democrats; James H. Preston was reelected mayor over Charles H. Heintzeman. In November, 1915, Emerson C. Harrington, Democrat, was elected governor over Ovington E. Weller, Republican. The Democrats won control of the Legislature. In the same election, amendments to the State constitution were adopted, permitting increased home rule for Baltimore and the counties, and instituting the referendum except on sumptuary legislation. President Wilson carried the State the next year over Charles E. Hughes, Republican candidate for President. Dr. Joseph I. France, Republican, defeated David J. Lewis, Democrat, for United States Senator, and the seats in the House were divided between four Democrats and two Republicans. An amendment to the State constitution was adopted, effecting a drastic budget system for the State government. Special referendums were held on prohibition in local areas. Baltimore voted heavily against prohibition; most of the smaller areas voting also rejected prohibition. In 1917, the Republicans won the House of Delegates, and the Democrats the State Senate. The Legislature was Republican on joint ballot, for the first time in 20 years. In 1918, the Congressional delegation was divided equally, with three Democrats and three Republicans. A new charter was voted by the people of Baltimore, under the home rule amendment adopted in 1915. In May, 1919, the Republicans won a decided victory in the municipal elections of Baltimore, William F. Broening, Republican, defeating George Weems Williams, Democrat, for Mayor. In the November election, Albert C. Ritchie, Democrat, was elected governor over Harry W. Nice, Republican, by less than 200 plurality. The Legislature was Democratic. In November, 1920, Warren G. Harding, Republican, swept the State for president, against James M. Cox, Democrat; Ovington E. Weller, Republican, defeated John Walter Smith, Democrat, for United States Senator, the Republicans won four members of the House, and the Democrats two. In 1921, the Democrats elected the majority of the Legislature. In 1922, William Cabell Bruce, Democrat, was elected United States Senator over Dr. Joseph I. France, Republican; the six members of the House were divided equally between Democrats and Republicans; and the people adopted constitutional amendments increasing Baltimore's representation in the Legislature and reducing the number of State elections. In May, 1923, Howard W. Jackson, Democrat, was elected mayor of Baltimore over William F. Broening, Republican, and James H. Preston, candidate of the Citizens' party. In November, 1923, Albert C. Ritchie, Democrat, was reelected governor by a

large majority over Alexander Armstrong, Republican. The Democrats won the Legislature.

Legislation Maryland's Legislature met in even years until and including the 1924 session. No regular session occurs between 1924 and 1927. Beginning with 1927, sessions are to be held in the odd years. In 1914, the Legislature enacted much legislation demanded by public opinion, including a new tax law, and established a new tax commission; it also passed a law for a survey of the public schools in the counties, a workmen's compensation law, and a new oyster-planting law. It also submitted to the people the home rule and referendum amendments to the constitution. In 1916, the Legislature submitted to the people the budget amendment, providing for a budget to be prepared by the Governor, items in which could be decreased or eliminated by the Legislature, although that body could not increase or insert items. A modern school law was enacted, based on the report of the survey previously provided, and the State departments were partially reorganized. In May and June, 1917, a special war session appropriated an emergency fund, created a State Council of Defense, and passed laws to compel work and for other war purposes. In 1918, the Legislature enacted the annexation law, largely expanding the corporate limits of Baltimore, and ratified the eighteenth amendment to the Federal Constitution. In 1920, the Legislature instituted the merit system in the civil service of the State. In 1922, it enacted a measure reorganizing the State government into departments, and submitted a \$9,000,000 soldiers' bonus to the people; the latter was invalidated by the courts. This session also submitted to the people the constitutional amendment increasing Baltimore's representation in the Legislature and an amendment providing one State election every four years instead of every two. Under the terms of the latter, State elections would be held in every other even year, beginning with 1926, and State officials, including legislators, would be elected for four-year terms. The 1924 session was devoted to routine legislation. In 1920, 1922, and 1924 the Legislature refused to pass bills for State enforcement of the eighteenth amendment.

MARYLAND, UNIVERSITY OF. A State institution at College Park and Baltimore, Md., founded in 1807. The student enrollment increased from 1200 in 1914 to 3735 in 1923, the number of faculty members from 211 to 253, and the library from 25,000 to 34,425 volumes. The annual income increased from \$250,000 in 1914 to \$1,889,760 in 1923. Part of an extensive building programme was completed in 1923. It included a stadium, a gymnasium and armory, and a dairy manufacture laboratory, at a total cost of \$262,800, and a research laboratory for animal pathology at a cost of \$10,000, all at College Park. At Baltimore a new building was purchased and equipped at a cost of \$40,000 for the Schools of Dentistry and Pharmacy; a new X-ray laboratory was equipped in the university hospital at a cost of \$10,000, and a nurses' home was built; and the Baltimore College of Dentistry, the first dental college established in the world, consolidated with the School of Dentistry of the University of Maryland. The extension courses in commerce were reorganized as the College of Commerce and Business Administration. The university changed

from the trimester to the semester system. President, Albert F. Woods, A.M., D.Agr., LL.D.

MASARYK, THOMAS GARRIGUE (1850-). President of Czecho-Slovakia, born in Hodonin, Moravia. He was educated in the Universities of Vienna and Leipzig. He taught for several years and for a time was professor at the New Bohemian University of Prague. He was head of the Czecho-Slovak realistic movement in philosophy, literature, and politics and founded several reviews. In 1891 he entered Parliament and resigned in 1893. He was elected a deputy in 1907. He resisted strongly the encroachments of Germany on Austria and the aggressive policy of Austria in the Balkans. At the outbreak of the War he retired to Italy and Switzerland. He later became a lecturer in King's College, London. He organized the Czecho-Slovak movement of independence and visited the United States in its behalf. On the establishment of the republic he was elected president and by a provision of the constitution is qualified to hold that office during his entire life. He is the author of several books, including *The Problems of Small Nations in the European Crisis* (1915). See CZECHO-SLOVAKIA.

MASEFIELD, JOHN (1875-). An English poet and dramatist (see VOL. XV). He continued to produce works in both prose and poetry during the decade. His later books include *The Faithful* (1915); *Gallipoli* (1916); *The Old Front Line* (1918); *Enslaved, and Other Poems* (1919). He participated in the campaign in Gallipoli, and his description of operations there forms one of the most vivid pages in the written history of the War.

MASON, EDITH (1892-). An American dramatic soprano, born at St. Louis, Mo. After studying with several teachers in New York, Boston, Philadelphia, and Paris, she made her debut as Nedda in *Pagliacci* with the Boston Opera Company (Jan. 27, 1912). During the next three years she sang in Nice, Marseilles, and Paris. In 1915-17 she was a member of the Metropolitan Opera Company. Then followed engagements in Havana, Caracas, and Mexico City, until 1919. In 1919-20 she appeared in Monte Carlo and again in Paris, and in 1921 she became one of the leading singers of the Chicago Opera Association. In 1919 she married Giorgio Polacco.

MASON, MAX (1877-). An American mathematician, born at Madison, Wis., and educated at the University of Wisconsin and at Göttingen. In 1903 he became instructor of mathematics at the Massachusetts Institute of Technology and was appointed assistant in that subject at the Sheffield Scientific School of Yale, where he remained until 1908, when he accepted a call to Wisconsin. He became professor of mathematical physics there in 1911. He also lectured on his specialty at Harvard (1911). He made important studies on the calculus of variations, and the electromagnetic theory in pure mathematics. In the applied branches he contributed researches on submarine detection devices and acoustical compensators. During the War he was a member of the research staff at the United States Navy Experiment Station at New London and a member of the division of physical sciences of the National Research Council. He is the author of *The New Haven Mathematical Colloquium* (1910).

MASSACHUSETTS. Massachusetts is the

44th State in size (8266 square miles), and the sixth in population; capital, Boston. The population increased from 3,366,416 in 1910 to 3,852,336 in 1920, a gain of 14.4 per cent. The white population rose from 3,324,926 to 3,803,524; negro, from 38,055 to 45,466; native-born white, from 2,273,876 to 2,725,990; foreign-born white, from 1,051,050 to 1,077,534. The urban population mounted during the decade from 3,125,367 to 3,650,248; the rural population, on the other hand, decreased from 241,049 to 202,108. The growth of the principal cities was as follows: Boston (q.v.), 670,585 in 1910 and 748,000 in 1920; Worcester (q.v.), 145,986 to 179,754; Springfield (q.v.), 88,926 to 129,614; New Bedford (q.v.), 96,652 to 121,217; and Fall River (q.v.), 119,295, to 120,485.

Agriculture. While the population of the State increased 14.4 per cent in the decade, the percentage of the total population in rural territory, already small, decreased from 7.2 in 1910 to 5.2 in 1920. The number of farms decreased 13.3 per cent, from 36,917 to 32,001; the land in farms decreased 13.3 per cent, from 2,875,941 acres to 2,494,477; and the improved land in farms, from 1,164,501 acres to 908,834. The total value of farm property showed an apparent increase from \$226,474,025 in 1910 to \$300,471,743 in 1920: the average value per farm, from \$6135 to \$9389. In interpreting these values, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration; the index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes in 1910 was 55.9 per cent, compared with 48.5 per cent in 1920. The percentage of improved land decreased from 40.5 to 36.4. Of the total of 32,001 farms in 1920, 28,087 were operated by owners, 1627 by managers, and 2287 by tenants. The comparative figures for 1910 were 32,075, 1863, and 2979. White farmers in 1920 numbered 32,880, compared with 36,793 in 1910. In 1920, 22,950 of these were natives, as compared with 28,431 in 1910. Foreign-born farmers, for the most part from Canada, numbered 8930 in 1920 and 8362 in 1910. Negro farmers numbered 103, both in 1910 and in 1920. There were, in 1920, 18 Indian farmers, compared with 21 in 1910. Farms free from mortgage in 1920 numbered 14,055, compared with 18,768 in 1910; those under mortgage, 12,632 compared with 13,014. The number of dairy cows in 1920 was 173,844, compared with 171,936 in 1910; "beef cows," 5530, compared with 20,100; sheep, 18,880, compared with 22,699. The development in agriculture was in the direction of market gardening and special crops such as tobacco and onions. The area in tobacco increased 65 per cent in the decade. The estimated production of the chief farm crops in 1923 was as follows: corn, 2,778,000 bushels; oats, 340,000; potatoes, 3,122,000; hay, 559,000 tons; and tobacco, 13,700,000 pounds. Comparative figures for 1913 are: corn, 1,944,000 bushels; oats, 315,000; potatoes, 2,835,000; hay, 575,000 tons; and tobacco, 9,455,000 pounds.

Manufactures. Massachusetts is one of the most important of the industrial States. There were, in 1920, 66 cities having more than 10,000 inhabitants, whose combined population in that year formed 81.6 per cent of the total for

the State and in 1919 reported 86.3 per cent of the value of the State's manufactured products. There were in the State, in 1909, 11,684 manufacturing establishments; in 1914, 12,013; and in 1919, 11,906. Persons engaged in manufacture numbered 644,399, 676,642, and 812,521; and capital invested amounted to \$1,279,686,558, \$1,548,960,733, and \$2,947,108,527, in those years. The value of the products in 1909 was \$1,490,529,386; in 1914, \$1,641,373,047; and in 1919, \$1,011,181,532. The increase in value of the products between 1914 and 1919 was in great measure due to changes in industrial conditions brought about by the War. The increase in number of persons engaged in manufacture, on the other hand, clearly indicates a considerable growth in the manufactures of the State. The most important industry in point of value of products is the manufacture of cotton goods, valued in 1909 at \$186,462,000, in 1914, \$197,322,000; and in 1919, \$604,938,000. The manufacture of boots and shoes ranks second, with \$236,343,000 in 1909; \$255,188,000 in 1914; and \$573,037,000 in 1919. Woolen, worsteds, and felt goods, in third place, were valued at \$141,967,000 in 1909; \$130,349,000 in 1914; and \$352,913,000 in 1919. The manufacture of leather ranked fourth, amounting in value, in 1909, to \$40,002,000; in 1914, \$45,265,000; and in 1919, \$129,595,000. The most important manufacturing cities, in point of value of products, are Boston, Worcester, Fall River, Lawrence, and New Bedford. There were in Boston, in 1909, 3195 establishments, with a product valued at \$244,793,000; in 1914, 3138 with \$284,802,000; in 1919, 3077 with \$618,922,000. In Worcester, in 1909, there were 580 with \$77,148,000; in 1914, 606 with \$82,829,000; and in 1919, 618 with \$208,706,000. Fall River had 288 manufacturing establishments, with a product valued at \$64,146,000 in 1909; in 1914, 315 with \$64,663,000; in 1919, 293 with \$163,246,000. Similar figures for New Bedford were: in 1909, 207 with \$53,238,000; in 1914, 233 with \$65,575,000; and in 1919, 267 with \$210,773,000. Other important manufacturing cities are Lowell, Lynn, Somerville, Brockton, Springfield, Cambridge, and Haverhill.

Education. Massachusetts, from its earliest history, has devoted its utmost efforts to improvement of the educational facilities and conditions of its inhabitants. Progress continued in the State in the decade 1914-24. The Legislature during that time passed many important measures affecting education; among the most notable was an act, in 1919, establishing and maintaining continuation schools and courses of instruction for employed minors. Another act of 1919 raised the minimum educational requirements for leaving school to seek employment from the completion of the fourth to the completion of the sixth grade; a third established special classes for mentally retarded children. In 1921 the provisions of Congress for promotion of vocational rehabilitation were accepted by the State; a measure was passed providing for physical education for pupils in the elementary and secondary schools; a minimum salary of \$750 was established for all full-time teachers in the public day schools; and three measures to promote civic education in the public schools were enacted, requiring courses in duties of citizenship, United States history and civics, and the Constitution of the

United States The growth of the school system is indicated by the fact that in 1914 the total school enrollment was 576,510; in 1923, 685,645. The percentage of illiteracy in the State decreased from 6.2 in 1910 to 5.9 in 1920: among the native white, from 0.4 to 0.3, among the negro, from 9.7 to 8.2. Among the foreign-born white population illiteracy increased from 13.1 to 13.5.

Finance. For finance, see **STATE FINANCES**. Also see **MUNICIPAL GOVERNMENT**.

Political and Other Events. There was much of importance in the political history of Massachusetts in 1914-24. In the latter part of that period, the State was honored by the accession of its former governor, Calvin Coolidge, to the presidency. Elections for State officers are held annually. In 1914 Governor Walsh, Democratic candidate, was elected, while the Republicans were successful in winning the minor State offices. The Cape Cod Canal was formally opened on July 29, 1914. On June 25 of this year a fire destroyed a large part of the city of Salem, causing a loss of about \$12,000,000. In 1915 Samuel W. McCall, Republican, was elected governor, defeating Governor Walsh, and Calvin Coolidge was elected lieutenant-governor. A woman suffrage amendment submitted to the people was defeated by a large majority. In 1916 Governor McCall and Senator Henry Cabot Lodge were reelected. In the presidential voting, Charles E. Hughes won 278,765 votes, compared with 247,845 votes for President Wilson. Governor McCall was elected for a third term in 1917. In 1918, however, the Democrats developed sufficient strength to elect former Governor Walsh to the United States Senate, defeating Senator Weeks, Republican, who was a candidate for reelection. Calvin Coolidge was elected governor, defeating Richard H. Long, Democrat. Governor Coolidge was reelected in 1919 and again in 1920. A strike of the Boston police, in September, 1919, drew nation-wide attention. A movement had been carried on for some time for the unionization of the police force. This was opposed by Commissioner of Police Edwin U. Curtis, who denied the right of the police to join a labor union. He was strongly upheld in this stand by Governor Coolidge. The police abandoned their posts and a night of rioting ensued. The militia was called out pending the recruiting of a new force. No striking officer was reinstated. Major Henry L. Higginson, founder and sustainer of the Boston Symphony Orchestra for 37 years, died on Nov. 14, 1919. He provided for the continuance of the orchestra under a board of trustees. In the presidential election of 1920, Warren G. Harding received 681,153 votes and James M. Cox 276,691, and Governor Coolidge became vice president. The Republicans in 1921 elected Channing H. Cox governor. Henry Cabot Lodge was reelected to the Senate, but by a greatly reduced majority. Two women, elected to the State Legislature, were the first so honored. During the summer of 1921 a pageant celebration was held at Plymouth commemorating the Pilgrim Tercentenary. On Apr. 13, 1922, the Supreme Court held that women were eligible for any State office. This year saw a cleansing of questionable legal practices. Two district attorneys were ousted and later disbarred, along with several other practicing attorneys. Governor Cox was reelected in 1923. The historic Washington elm,

in Cambridge, was cut down on Oct. 27, 1923. It had been dying for many years.

Legislation. The Legislature in Massachusetts meets annually. The most important acts in the decade 1914-24 are noted below. In 1914 the Legislature submitted a constitutional amendment giving the suffrage to women. It was necessary to pass this also in the Legislature of 1915. The amendment, as noted above, was defeated by a large majority. In 1916 the Legislature amended the laws relating to judicial procedure and also passed a defense act and amended the workmen's compensation law. The Federal prohibition amendment was adopted by the Legislature of 1918. In 1919 the Legislature ratified the woman suffrage amendment, passed measures providing for absentee voting, passed a so-called red flag law, enacted a measure regulating the use of aircraft, and reorganized the executive and administrative functions of the State. In 1921 a daylight-saving law was passed, a State boxing commission was created, the appointment of policewomen in Boston was authorized, and the workmen's compensation law was amended. In 1921 the Legislature amended the laws relating to the employment of minors and to automobiles. It also amended the game laws and provided for systems of relief for neglected, dangerous, or uncontrollable feeble-minded persons. In 1922 the Legislature created a new State commission of administration and finance. It also revised the State banking laws and amended the election laws. A measure providing for more stringent enforcement of prohibition was defeated. In 1923 a measure was passed centralizing the personnel and financial side of the government under a commission of four, in which is a comptroller's bureau, a budget bureau, a purchasing bureau, and a bureau of personnel. A measure was also passed regulating the sale of coal and one to facilitate cooperative marketing of agricultural produce.

MASSACHUSETTS AGRICULTURAL COLLEGE. A State institution for agricultural training founded at Amherst, Mass., in 1867. The number of four-year students fell from 526 in 1914 to 431 in 1923-24, but the total enrollment, including those taking the short courses, rose from 936 to 950. The number of faculty members increased from 56 to 92, volumes in the library from 45,000 to 70,000, and the annual State appropriation from \$317,746 to \$876,950. Six new buildings were added. President, K. L. Butterfield (resigned in 1924).

MASSACHUSETTS INSTITUTE OF TECHNOLOGY. A nonsectarian institution for technical education at Cambridge, Mass., founded in 1861. In 1916 it was moved from its old quarters in Boston to a group of new buildings in Cambridge, facing the Charles River and having 800 rooms. The enrollment of students increased rapidly, with the exception of the war years, to approximately 3500 in each of the two years 1920-21 and 1921-22, and dropped again to 2950 in 1923-24. The faculty was increased during the same period from 268 to 375 and the library from 120,000 to 155,609 volumes. More than \$14,000,000 was added to the endowment, which was \$3,049,975 in 1914 and \$17,278,000 in 1923-24. Of this, \$6,500,000 was given by George Eastman. The School of Naval Architecture was built from funds bequeathed to the Institute by C. H. Platt prior to the War. In 1917-18 army and

navy schools of aéronautics and a school for aéronautical engineers were maintained for the Federal government, and a school for deck officers was opened by the United States Shipping Board. Richard Cockburn MacLaurin, LL.D., was president until his death in 1920. He was succeeded by Ernest Fox Nichols, LL.D., who resigned in the following year because of ill health. President, Samuel Wesley Stratton, D Eng., Sc.D., LL.D.

MASSEY, WILLIAM FERGUSON (1856-1925). A New Zealand statesman, born in Limavachy, County Derry, Ireland. In 1870 he moved to New Zealand and was for several years engaged in farming. He was early identified with the political life of the country and held many important positions. From 1894 he was a member of Parliament. He was Prime Minister in 1912 and was later Minister of Finance, Railways, Land, Labor, Agriculture, Industries, and Commerce. In 1917-18 he represented New Zealand in the Imperial War Cabinet and in 1919 was a delegate to the peace conference in Paris. He was also a delegate to the Imperial conference in London in 1921. He wrote various pamphlets on miscellaneous subjects.

MAST, SAMUEL OTTMAR (1871-). An American zoölogist born in Washteno County, Mich., and educated at Michigan and Harvard Universities. He was professor at Hope College (1899-1908); associate professor and professor at Goucher College (1908-11); and associate professor and professor at Johns Hopkins University (1911-). Professor Mast published numerous articles in journals, mainly on animal reactions, as well as *Structure and Physiology of the Flourcring Plants* (1907) and *Light and the Behavior of Organisms* (1911).

MASTERS, EDGAR LEE (1869-). An American writer, born in Garnett, Kan. He was educated at Knox College in Illinois and for a time studied law. His first book of poems was published in 1898 and was followed by several others. He attracted wide attention only after the publication of *Spoon River Anthology* in 1915. This was one of the most sensational books of verse published in many years. He wrote *Songs and Satires* (1916); *The Great Valley* (1916); *Toward the Gulf* (1918); *Starved Rock* (1919); *Mitch Miller*, a novel (1920); *Open Sea* (1921); *The Nuptial Flight* (1923), and *New Spoon River Anthology* (1924). He was a member of the National Institute of Arts and Letters.

MASURIAN LAKES. See **WAR IN EUROPE, Eastern Front.**

MATERNITY PROTECTION. Statistics in 1924 showed that the death rate among mothers, in the United States birth registration area, from causes connected with maternity, was not only greater than in 1915 but was higher than in all but one foreign country for which figures were available; and infant mortality, although it had decreased, was still higher than that of six other countries. Investigations over a number of years having revealed that employment of the mother during pregnancy was associated with a markedly high stillbirth rate, a high rate of premature births, and a high mortality in early infancy from causes directly related to the health of the mother before birth, legislative safeguards for maternity among working women began to be adopted in 1911 when Massachusetts enacted a law prohibiting the employment of women within a period of two

weeks before or two weeks after childbirth. Connecticut, Delaware, Missouri, and Vermont afterward made similar provisions. (See **WOMEN IN INDUSTRY**) In 1921, after three years of effort, the Sheppard-Towner Act for the promotion of the welfare and hygiene of maternity and infancy was enacted. This act appropriates annually to each State accepting the provisions of the act the sum of \$5000 outright, with an additional \$5000 if matched from the State's own funds; while a still further sum is apportioned on the basis of population, when matched by State appropriations. Before the end of 1921 Delaware, Minnesota, New Hampshire, New Mexico, and Oregon had passed legislative acceptances of the act and had made administrative provisions. At the end of 1922, 42 States had accepted, 11 by legislative action, 31 through their governors pending the next session of their legislatures. The system was in operation in the fiscal year 1924 in 40 States, i.e. all but Connecticut, Illinois, Kansas, Louisiana, Massachusetts, Maine, Rhode Island, and Vermont; and for Hawaii an appropriation had been authorized for the fiscal year ending June 30, 1925. Porto Rico and Alaska had requested that the benefit be extended to them. The constitutionality of the Sheppard-Towner Act was challenged in 1923 but the constitutionality of the act was upheld by the Supreme Court of the United States as being an optional measure which imposed no obligation. Great Britain adopted a maternity and child welfare act in 1918. In 1923 the ministry of health reported 1950 maternity and infant welfare centres and 128 maternity homes in England and 222 maternity and child welfare centres in Wales.

MATHEMATICAL PHILOSOPHY. See **PHILOSOPHY.**

MATHER, FRANK JEWETT, JR. (1868-). An American art critic and professor (see **VOL. XV**). His more recent writings include *Estimates in Art* (1916); *The Portraits of Dante* (1921); and *A History of Italian Painting* (1923). He became editor of *Art Studies* in 1923.

MATHEWS, ARTHUR FRANK (1860-). An American painter and teacher, born in Wisconsin, and educated at the schools of San Francisco and Oakland, Cal. In Paris he was the pupil of Gustave Boulanger and studied art in Europe for five years. He also made a study of architecture. His work included the reorganization of the California School of Design, where he was art director from 1890 to 1906. He has exhibited in the leading art centres of Europe, including the Paris Exhibition and the Salon, and at leading galleries in the United States; his work appears in permanent collections at the Metropolitan Museum, where he has a "California Landscape," at the State Capitol at Sacramento, Cal., the Oakland Library at Oakland, Cal., and the Masonic Temple in San Francisco. He also executed four triptychs for the University of California Library. He is a contributor of articles on art to reviews and is managing editor of the *Philopolis Magazine*.

MATHEWS, JOHN ALEXANDER (1872-). An American metallurgist, born at Washington, Pa., and educated at Washington and Jefferson College, Columbia University, and in London at the Royal School of Mines and as a Carnegie Research Scholar at the British Steel and Iron Institute. He was metallurgist with the Sanderson Brothers Steel Company (1902-08) and

thereafter was general manager and president of the Halcob Steel Company until 1920, when he became president of the Crucible Steel Company of America. He is an accepted authority on the metallurgy of iron. He directed his attention to alloy steels, especially electric furnace steel processes. Dr Mathews received the first award of the Andrew Carnegie Gold Medal for Research in 1902 and was a member of the United States Assay Commission in 1900, 1905, and 1911.

MATTER, THEORIES OF. See **CHEMISTRY.**

MAUGHAN, RUSSELL L. (?-). An American aviator who wrote a new page in the annals of aviation on June 23, 1924, when in a Curtiss pursuit plane he successfully made a dawn-to-dusk flight from New York to San Francisco in 21 hours and 48 minutes. This flight was undertaken by the Air Service to show the public the speed at which pursuit squadrons could be rushed from coast to coast in a war emergency.

MAURITIUS. An island British crown colony situated in the Indian Ocean 500 miles east of Madagascar. The area of the whole colony, which includes several small islands, is 720 square miles; the population in 1921 was 385,074, of which Indians and Indo-Mauritians numbered 265,884 and Chinese 6820. The capital and chief port, Port Louis, had 50,308 inhabitants in 1921. Sugar raising continued to engage almost the whole population. The sugar export in 1912 amounted to 208,677 metric tons; in 1919, it reached 302,826 tons; in 1921-22 it was 182,234 tons; in 1922, 292,744 tons. Aloe fibre and copra were the other exports. Total exports for 1913 and 1922 were £2,241,084 and £6,825,658. Total imports for 1913 and 1922 were £2,466,800 and £5,158,658. Imports included, in order of their value for 1921, machinery, cotton goods, iron and steel manufactures, ammonium sulphate, etc. In 1922, 451 vessels of 908,997 tons entered and cleared. In 1910, the tonnage had been 986,000. During the War the entire sugar crop was purchased by the British government at the prevailing high prices with the result that prosperity in the island was unexampled. This continued after the War and through the world-wide depression of 1920-21. Revenues for 1913-14 and 1920-21 were £742,846 and £2,678,000; expenditures, £681,098 and £1,649,000. On June 30, 1921, the colonial debt was £1,273,000. The municipal debt of Port Louis, contracted for harbor improvements in 1920, was £103,000. Accounts are kept in rupees, and conversions have been made at the nominal exchange rate of Rs 15 = £1. The colony continued peaceful under British rule. The agitation of the Creoles for the return of the island to France in 1919 was short-lived, the continued prosperity stilling all dissent.

MAX, PRINCE OF BADEN (1867-). A German statesman, born in Baden Baden. After studying law, he entered the army but retired without having seen active service. He was president of the First Chamber of the Baden Diet from 1907 to 1918. On account of the fact that he was not identified particularly with any prominent party, he was chosen chancellor on Oct. 3, 1918. During the consideration of the armistice proposals made by the Allies on November 9, he issued a formal declaration of the abdication of the Kaiser, and on the following day resigned from office. See **BADEN; GERMANY.**

MAXIM, HUDSON (1853-1927). An American mechanical engineer (see **VOL. XV**). In 1915 and during the War he was a member of the United States Navy Consulting Board. He published *Defenseless America* (1915) and *Dynamite Stories* (1916).

MAYBECK, BERNARD RALPH (1862-). An American architect, born in New York City. He studied architecture in Paris and at the University of California. From 1892 to 1900 he was instructor in drawing, descriptive geometry, and architecture at the University of California. He was the originator and manager of the Phoebe A. Hearst competition for the architectural design for the University of California and from 1902 was dean of the Department of Architecture of that University. He designed buildings for the Panama-Pacific Exposition and other important buildings for several towns and cities. He was associated with the United States Shipping Board during the War and was a founder of the Council of Allied Arts.

MAYNARD, THEODORE (1890-). An American lecturer and author, born at Madras, India, and educated in India, in England, and at the Mt. Hermon School in Massachusetts. From 1909 to 1911 he resided in the United States and studied for the Congregational ministry. In 1911 he removed to England and in 1913 was received into the Roman Catholic Church. From 1921 he was professor of English literature in the Dominican College at San Rafael, Cal. He wrote *Drums of Defeat* (1916); *Folly and Other Poems* (1918); *The Last Knight* (1921); and *The Divine Adventure* (1921). In 1916 he was the winner of the Malory prize offered in London for the best volume of poetry.

MAYNC, HARRY (1874-). A German writer, born in Berlin, who studied at the universities of Berlin and Leipzig. He was made editor of the German classics published by the Bibliographisches Institut of Leipzig and lectured at the University of Marburg. He later became director of the Seminary of the University of Berne. He is the author of *Uhlands Jugendgedichte* (1899); *Eduard Moricke: Sein Leben und Dichten* (1901); *Die Altdeutschen Fragmente von König Tirol und Fridebrand* (1910); *Wilhelm Meisters Theatralische Sendung* (1910); *Dichtung und Kritik: eine Rechtfertigung der Literaturwissenschaft* (1912); *Liencron* (1919); *Fontane* (1920); and *Immermann: Leben und Werke* (1921). He also edited the works of Uhland, Moricke, Goethe, Immermann, Gottfried Keller, and Fontane.

MAYO, CHARLES HORACE (1865-). See **MAYO, WILLIAM JAMES.**

MAYO, WILLIAM JAMES (1861-). (See **VOL. XV**.) The most momentous event in the history of the Mayo Clinic at Rochester, Minn., occurred in 1915, when W. J. and C. H. Mayo donated \$2,000,000 to establish the Mayo Foundation for Medical Education and Research in affiliation with the University of Minnesota. During the War in Europe W. J. Mayo was made chief surgical consultant to the Medical Corps, United States Army, with the rank of colonel. C. H. Mayo was made associate consultant in surgery at the same time.

MAYRHOFER, JOHANNES (1877-). A German writer, born at Hamburg, and educated in philosophy and æsthetics at the universities of Berlin and Münster. He was for four years private tutor in Copenhagen and later traveled

extensively in Europe. As a literary free lance in Hamburg, Berlin, and Regensburg, he began to write works of fiction and travel. He is the author of *Der Mutter Vermachtniss* (1903); *Gebroder Plausich* (1908); *In der Jasminlaube* (1909); *Der Kleine Abenteuer* (1911); *Jesuitten* (1916); *Der Kaiser des Sonnengottes* (1917); *Dilettanten der Liebe* (1919); *Was die Alster Rauscht* (1910); *Nordische Wunderfahrt* (1913); *Der Zauber des Sudens* (1913); *Durch Lander und Meere* (1915); *Spanien* (1915); and *Türkische Lenzstage* (1917). He also wrote essays which include *Das Ideal des Schulmeisters* and *Ibsen*.

MEAD, ALBERT DAVIS (1869-). An American zoölogist, born at Swanton, Vt., and educated at Middlebury College and Brown, Clark, and Chicago Universities. He was instructor in comparative anatomy (1895-96), associate professor (1896-1900), and professor of comparative anatomy (1900-) at Brown University. Professor Mead published articles on the natural history of marine invertebrates and on the artificial culture of marine food animals.

MEAD, CHARLES LAREW (1868-). An American bishop, born at Vienna, N. J., and educated at New York University. In 1895 he was ordained to the Methodist Episcopal Ministry and from 1895 to 1920 served as pastor in churches in New Jersey, Maryland, New York, and Colorado. He was ordained bishop of the Methodist Episcopal Church in 1920. During the War he served with the Y. M. C. A. in France.

MEASLES. Beginning with 1916 studies were prosecuted in several countries which resulted in the possibility of immunizing children against measles. Natural insusceptibility to this disease is as good as nonexistent; and as it destroys 10,000 lives annually in the United States, much salvage of life may result from wholesale immunization. On account of the long incubation period it is possible to prevent the disease after the child has been exposed, and immunization should of course be practiced as soon after exposure as possible. The immunizing substance is ideally the whole blood or plasma of a person who has recently recovered from measles, but it has been learned that the blood of practically all adults still contains the original immunizing substance which prevents contracting the disease a second time. Hence, in an emergency any adult may furnish immunizing blood: usually the parents of the child are called on. About a pint of blood may be taken at a time, as it is possible to preserve it for six months, and in case of epidemics sufficient blood may be difficult to obtain. It is necessary, as in blood transfusion, to be sure that the blood donor is healthy. The individual immunizing injection is small in amount, about 2.5 cubic centimeters. This is called the immunizing unit. If great haste is expedient and no blood is available, it may be taken from a parent and injected directly into the muscles. Immunization will have three consequences. In a few cases it will fail, and the patient will have typical measles. In other cases the child will develop modified measles, a very mild form. Finally, and in the majority of cases, it will escape the disease altogether. To show what may be done under favorable circumstances, Zingher of the New York City Health Department secured 90 per cent complete immunity in

one large series of cases treated in this way. **MEASUREMENTS, PRECISION.** See PHYSICS.

MEDICAL PROGRESS. The theory and practice of medicine and surgery made great advances during the period 1914-24. The War afforded the widest opportunity for the practice of military surgery and for the prosecution of hygienic and sanitary measures under military conditions. In certain cases enforced sanitation was practiced among the civil population which came under military authority or where the people generally were governed more directly than usual in the stress of War circumstances. Naturally there was some relaxation of the efforts of research hospitals and the devotees of experimental medicine in their laboratories, but after the termination of hostilities these and other agencies attacked their various problems with redoubled vigor, besides investigating questions raised by the War itself. At no time in the history of the world was medical research better organized, with more coöperation among the institutions concerned, or with more good will of the general public. For discussions of the fields in which progress has been most notable and results most interesting, see ABORTION; ADRENALIN; ANEMIA; ANGINA PECTORIS; ANTHRAX; BIOCHEMISTRY; BLOOD PRESSURE; BOTULISM; BUBONIC PLAGUE; CANCER; CHIROPRACTIC; DIABETES; DIET; DIPHTHERIA; EPILEPSY; GALL STONE DISEASE; GOITRE; HAY FEVER; HEART DISEASE; INFANTILE PARALYSIS; INFLUENZA; INSANITY; LEPROSY; MALARIA; MEASLES; NEPHRITIS; PELLAGRA; PNEUMONIA; RHEUMATISM; RICKETS; SCARLET FEVER; SCURVY; SECRETIONS, INTERNAL; SLEEPING SICKNESS; SMALLPOX; SURGERY, RECONSTRUCTIVE; SYPHILIS; TUBERCULOSIS; TYPHOID FEVER; TYPHUS FEVER; VITAMINE; WOUNDS; YELLOW FEVER.

MEEKS, EVERETT VICTOR (1879-). An American architect and educator, born in Mt. Vernon, N. Y., and educated at Yale, at the School of Architecture of Columbia, and in Paris. For several years he was associated with Carrère and Hastings but after 1914 practiced alone. He was acting professor of architecture at Cornell from 1914 to 1916, and from 1916 he was on the faculty of the School of Fine Arts at Yale as head of the department of architecture. During the War he was assistant director of fine arts of the Army Overseas Educational Commission. He became a member of the Society of Beaux-Arts Architects, the Société des Architectes Diplômés par le Gouvernement Français, etc.

MEGGERS, WILLIAM FREDERICK (1888-). An American physicist, born at Clintonville, Wis. He studied at Ripon College and at Wisconsin and Johns Hopkins Universities. He was instructor in physics at Ripon and at Wisconsin, after which he was connected with the Carnegie Institute of Technology (1912-14). In

1914 he was called to the Bureau of Standards, where he filled the place of physicist. Dr. Meggers made special researches on topics connected with spectroscopy, astrophysics, photography, and measurements of standard wave lengths. On all these subjects he has published articles in technical journals and in the publications of the Bureau.

MEGRUE, ROY COOPER (1883-). An American playwright, born in New York City, and educated at Columbia University. He wrote a great many successful plays, including *Under Cover*, with W. Hackett (1913); *It Pays to Advertise* (1914); *Under Fire* (1915); *Potash and Perlmutter in Society*, with Montague Glass (1915); *Seven Chances* (1916); *Under Sentence*, with Irvin S. Cobb (1916); *Where Poppies Bloom* (1918); *Tea for Three* (1918); and *Honors are Even* (1920).

MEIGHEN, ARTHUR (1874-). A Canadian public official, born at St. Mary's in western Ontario, and educated at Toronto University. For a short time he taught school. He then moved to Winnipeg, where in 1903, after studying law, he was admitted to the bar. In 1908 he was elected as a Conservative to the Dominion Parliament and soon gained a reputation as a debater. He was reelected in 1911 and two years later was appointed Solicitor General. In 1915 he became a member of the Privy Council, and on the reorganization of the Cabinet in 1917, with a coalition membership, he was made Minister of the Interior; this post he retained until his appointment as Premier, in 1920, succeeding Sir Robert Borden. He also held the office of Secretary for External Affairs. He remained in office until the defeat of his government in 1922. In 1918 he was a member of the Imperial War Cabinet.

MEIKLEJOHN, ALEXANDER. See **UNIVERSITIES AND COLLEGES**.

MEILLET, ANTOINE (1866-). A French Orientalist (see Vol. XV). He is the author of many valuable works, among the most recent of which are *Grammaire du Vieux Perse* (1915); *Caractères Généraux des Langues Germaniques* (1917); *Les Langues de l'Europe Nouvelle* (1918); *Aperçu de l'Histoire de la Langue Grecque* (1913-21); *Linguistique Historique et Linguistique Générale* (1921); *Grammaire de la Langue Polonaise*, with Mme de Wilmann-Grabowska (1921), and *Introduction à l'Étude Comparative des Langues Indo-Européennes* (1922). See **PHILOLOGY, MODERN**.

MEINECKE, FRIEDRICH (1861-). A German historian. He was born at Salzwedel, studied at the Universities of Berlin and Bonn, and worked on the Prussian archives (1887-91). He was lecturer at the University of Strassburg (1896-1901), then at Freiburg, and in 1914 at Berlin again. He is the author of *Von Stein zu Bismarck* (1908); *Das Zeitalter der Deutschen Erhebung, 1795-1815* (1913); *Redwitz und die Deutsche Revolution* (1913); *Die Deutsche Erhebung von 1914: Probleme des Weltkriegs* (1917); *Preussen und die Deutschen im Neunzehnten und Zwanzigsten Jahrhundert* (1918); *Weltbürgertum und Nationalstaat* (1919); and *Nach der Revolution* (1919).

MEINHARDT, RODERICH (1882-). An Austrian writer. The son of Adam Müller Guttenbrunn, the novelist, he was born at Vienna. He studied history and art at the university there and became literary adviser to several publishing houses. He is the author of *Nach der*

Heimat Möcht' Ich wieder (1920), *Die am Wege Blieben* (1920); *Untergang*, a play (1920); and *Wiener Totentanz* (1921).

MEISTER, ALOYSIUS (1866-). A German historian, born at Frankfort, and educated at the University of Strassburg and in Rome. He was appointed lecturer at the University of Bonn and in 1911 became professor at the University of Münster. He is the author of *Die Anfänge der Diplomatischen Geheimschrift* (1903); *Grundzüge der Historischen Methode* (1906); *Deutsche Verfassungsgeschichte des Mittelalters* (1907); *Friedrich der Grosse und das Preussische Westfalen* (1912); *Geschichte, Wissenschaft, und Unterricht* (1913); *Kabelkrieg* (1914); *Bismarcks Auswärtige Politik in 1871* (1915); *Die Deutsche Presse im Krieg und Später* (1916); *Richtlinien für das Studium der Geschichte* (1916); and *Der Neue Geschichtsunterricht* (1920).

MELANESIA. See **ETHNOGRAPHY**.

MELARTIN, ERKKI GUSTAF (1875-). A Finnish composer, born at Kexholm. He studied with Wegelius at the Helsingfors Conservatory and later under R. Fuchs in Vienna. For some years he taught theory and composition at the Helsingfors Conservatory. From 1908 to 1911 he was conductor of the symphony orchestra in Viborg and then returned to Helsingfors as director of the Conservatory. He is one of the most important of Finnish composers. His principal works are an opera, *Aino* (Helsingfors, 1907); four symphonies; two symphonic poems, *Suikajoki* and *Traumgesicht*; a violin concerto; incidental music to *Prinsessan Törnrosa*; four string quartets; and choruses, piano numbers, and songs.

MELDRUM, ANDREW MACKENZIE (1876-). An American educator, born at Kilwinning in Ayrshire, Scotland. He removed to the United States in 1894 and studied at the College of the Bible in Lexington, Ky. He also studied at Melbourne University. After being ordained as minister in the Church of Christ in 1902, he held pastorates in Oregon. From 1914 to 1916 he was field secretary and special lecturer of Spokane University, of which he became president in 1916. For many years he toured the world as an evangelist.

MELLON, ANDREW WILLIAM (1855-). An American Secretary of the Treasury, born in Pittsburgh, Pa., and graduated at the University of Pittsburgh in 1873. He at once entered the banking firm of Thomas Mellon and Sons of Pittsburgh, in which he was soon a partner. Later this firm developed into the Mellon National Bank, of which he became president in 1902, and the Union Trust Company and the Union Savings Bank, of both of which he was made vice president. He was long associated with H. C. Frick in the development of the coal, coke, and iron industries of western Pennsylvania and was an officer or director of many financial and industrial corporations. Mr. Mellon founded the town of Donora, Pa., established a large steel plant there, and built the first independent oil pipe line through Pennsylvania. His philanthropies were numerous, and he had much to do with the founding of Mellon Institute in Pittsburgh. In 1921 he was appointed Secretary of the Treasury by President Harding. He won an unusually high reputation as an authority on finance. In connection with his office he held the chairmanships of the Federal Reserve Board, the Farm Loan

Board, the War Finance Corporation, and the World War Foreign Debt Commission.

MELSTED, HENNING FINNE VON (1875-). A Swedish author (see VOL. XV). Among his works are *Osamja* (1915); *Folket i Fangenskap*, on Belgium in German captivity (1916); *Sieriges Fara* (1916); *Ensam*, a play (1917); *Gerda*, a novel (1918); *Mordbrannerskan*, a novel; and *Salomos Dom*, a play (1919).

MELTZER, SAMUEL JAMES (1851-1920). (See VOL. XV.) During the War in Europe, Dr. Meltzer was a major in the Medical Reserve Corps, and when the American Association for Thoracic Surgery was organized in 1918 he was elected president. Nearly up to the time of his death he was engaged in research along widely differing lines, notably in resuscitation by pharyngeal insufflation, injections of magnesium sulphate for anesthesia, experimental pneumonia, etc., and published numerous reports, alone and with collaborators.

MEMEL. This little town, with a population of 41,500 in 1910, at the mouth of the Niemen River in the southeast corner of the Baltic, became, during 1919-24, an important bone of international contention. As a harbor, before the War, it was comparatively insignificant: most of the trade of the region went by way of either Danzig and Königsberg, or Riga and Libau. Lumber was floated down the river to be shipped to England and the Rhenish cities, as well as some flax, seed, cereals, and cattle, while British coal and Norwegian chemical fertilizers were imported. Port facilities were antiquated and terminal conveniences inadequate, for no railway connected Memel with its hinterland. It was only during the War that Germany built a line north to Polanga, to connect at Prekult with the Libau-Mitau railway. By Article 99 of the Treaty of Versailles, the city and a narrow strip of territory to the southwest, containing an area of 945 square miles and a population of 150,000, were cut off from Germany and taken under the control of the Supreme Council. To German protests the Allies replied that while the city was German, the surrounding territory was undoubtedly Lithuanian, and that possession of the port was necessary to assure Lithuanian economic independence. In view of the unsettled state of Lithuanian affairs, it was deemed advisable to send a French force to take possession of the city early in 1920 and to hold it in trust for Lithuania. Friction at once manifested itself. The French were accused of listening too readily to the pro-German officials, of suppressing the local Lithuanian press, of entertaining Polish sympathies, and then of continuing their stay unnecessarily after Lithuania had received *de jure* recognition (Dec. 20, 1922). The local Germans sought the creation of a Memel Free State, while the Poles were frankly obstructionist. The tardiness of the Allies in settling the problem goaded the Lithuanians, chafing already as a result of the loss of Vilna, to take matters into their own hands. On June 10, 1923, therefore, the so-called Committee for the Welfare of the Territory of Memel seized the city, interned the French soldiers, and after a local diet had confirmed the step, had the satisfaction of announcing that Memel had become a part of Lithuania and that the customs lines were abolished. Allied protests were unavailing; the Kovno (Lithuanian) government disclaimed all complicity or even knowledge of the affair. Allied

warships came and departed, and the French garrison left, after a stay of almost four years. The Council of Ambassadors, on Feb. 16, 1923, drew up a statement of principles by which the transfer of the district to Lithuania was to be accomplished; to this, in principle, too, the Lithuanians subscribed. The formulation of a specific convention was another matter. To September, 1923, negotiations dragged on between the Lithuanian government and the Council of Ambassadors and eventually ended in a deadlock because of the Lithuanian refusal to accept the machinery proposed in the draft convention for the regulation of international commerce, specifically Polish, by and through the port. The matter was here complicated by the Polish claims that Memel constituted the natural outlet for about 60,000 square miles of Polish territory, that Poland was part of Memel's economic hinterland, and that Poland's interests therefore needed safeguards. Lithuania then proposed the adjudication of the matter by the Permanent Court of International Justice; the Council of Ambassadors decided, however, to submit the controversy to the League Council. Thus requested, the League Council, late in 1923, invited Norman H. Davis, an American, and two others, to act as arbitrators. On Feb. 4, 1924, the commission set to work, and on Mar. 14, 1924, it reported to the League Council. On that day, as a result of the arbitrators' findings, three conventions were signed by Great Britain, France, Italy, Japan, and Lithuania, which, in effect, provided for the transfer of Memel to Lithuania; the establishment of the city and region as an autonomous unit with full legislative, judicial, and administrative rights; the guarantee to foreign nationals of the same rights accorded the people of Memel; the creation of a harbor board of three made up of a representative each of Lithuania, Memel, and the League of Nations; the free transit by sea, water, and rail of all hinterland traffic. In all the negotiations, a marked conciliatory spirit was displayed by the Lithuanians, and, in the opinion of Mr. Davis, they had made the fullest concessions possible. Poland, however, remained disgruntled. See LITHUANIA, POLAND.

MEMPHIS. The commercial metropolis of Tennessee. The area of the city was increased from 19.3 to 25.3 square miles; the population rose from 132,778 in 1910 to 162,351 in 1920, to 170,067 by estimate of the Bureau of the Census (1923), and by city estimate to 211,058 in 1924. The city created a planning commission which prepared a major and minor street plan and zoning system. A considerable amount of building was carried on, including a municipal auditorium seating between 12,000 and 14,000 persons, new waterworks, three large hotels, several office buildings, industrial plants, apartments, a long viaduct across the Illinois Central Railroad tracks, a railroad bridge 4500 feet long across the Mississippi, extensive river-rail interchange terminals, and many new school buildings and additions, including the new Southwestern College. The Mississippi River Federal Barge Line was operated by the government, carrying over 12,000 tons of freight monthly in 1924, in addition to freight handled by many river packet steamers.

MENCKEN, H (ENRY) L (OUIS) (1880-). An American author and editor, born at Baltimore, Md. He was graduated at the Baltimore Polytechnic and at once began his journalistic

career on the *Baltimore Morning Herald*. Later he came to New York and was connected with the *Evening Sun*. In 1914 he became an editor of *Smart Set*; in 1921, a contributing editor of *The Nation*. He edited the *Players' Edition of Ibsen's Plays* (1909) and *The Free Lance Books* (1919-) and is the author of *Ventures into Verse* (1901), *George Bernard Shaw, His Plays* (1905); *The Philosophy of Friedrich Nietzsche* (1908); *The Artist* (1912); *A Book of Burlesques* (1916); *In Defense of Women* (1917); *The American Language* (1918); *Prejudices, First Series* (1919); *Second Series* (1920); *Third Series* (1922); and *On Democracy* (1922). In 1924 he undertook, with George Jean Nathan, the editorship of the new *American Mercury*.

MENDELISM. See BOTANY; HEREDITY.

MENDENHALL, CHARLES ELWOOD (1872-). An American physicist, born at Columbus, Ohio, and educated at Rose Polytechnic Institute and Johns Hopkins University. He was an aid on the United States Coast Survey, and during 1894-95, an assistant in physics at the University of Pennsylvania, after which he was an instructor at Williams. In 1901 he accepted a call to Wisconsin, where in 1905 he became full professor. His researches included studies on the absolute value of gravity, high temperature measurements, luminous efficiencies, and constants of radiation, on which he wrote important papers for various technical publications. During the War he was major in the science and research division of the Signal Corps and Air Service (1917-19) and chairman of the division of physical sciences in the National Research Council (1919-20). He also served as scientific attaché to the United States Embassy in London (1919).

MENDENDEZ, PIDAL RAMON (1869-). A Spanish philologist (see VOL. XV). He is the author of works on the history and literature of Spain. Among the most recent are *Antología de Prosistas Castellanos* (1917), *Crónicas Generales de España* (1918), *Estudios Literarios* (1920), and *Un Aspecto de la Elaboración del Quijote* (1921).

MENGELBERG, WILLEM (1871-). A Dutch orchestral conductor (see VOL. XV). In 1921 he made his second visit to the United States and conducted the newly established National Symphony Orchestra of New York for the second half of the season (Jan.-March). His sensational success brought about the amalgamation of the new orchestra with the Philharmonic Society and his permanent engagement as conductor for the second half of the Philharmonic season (Jan.-April). He retained at the same time his post as regular conductor of the Concertgebouw Orchestra in Amsterdam for the summer and fall; during his absence in New York this orchestra played under guest conductors.

MENOHER, CHARLES THOMAS (1862-). An American army officer, born in Johnstown, Pa., and educated there and at the United States Military Academy. He went to France in 1917 in command of the 5th Field Artillery (Regular). He later commanded the school of instruction for field artillery at Saumur in France. He was in command of the 42d (Rainbow) Division and later the 6th Army Corps. He was appointed director of the Air Service on Jan. 2, 1919, and chief of the Air Service on July 1, 1920.

MENSHEVIKS. See RUSSIA, *History*.

MENTAL MEASUREMENT. The rise of

intelligence tests during the decade 1914-24 constituted one of the most remarkable chapters in the history of applied science. Significant alike for its bearing on psychological theory and its effect on educational practice, the development of mental measurement was attended both by bitter controversy and enthusiastic hopes. The very nature of the undertaking, the effort to chart the resources and capacities of the human mind, could scarcely permit the scientific and lay public to remain either indifferent or uninterested. Moreover, the peculiar organization of the American school system, its freedom from tradition and from the control of a central authority, and its consequent readiness for pedagogical experimentation, all combined to give impetus to the movement for mental testing. If we add to this the preoccupation of the American public with the human quality of the recent immigration and the extraordinary opportunity afforded by the army mobilization for classifying the intellectual fitness of the racial stocks in the United States, we shall then be in a position to appreciate the extraordinary interest that has been taken in the new scientific technic.

The pioneer construction of tests and scales of intelligence was the work of two Frenchmen, Binet and Simon, in the decade before 1911. Although their work was immediately introduced into the United States, it was not until the publication of the Stanford revision of the Binet tests in 1916 that the movement passed out of the laboratory stage. After that date intelligence testing, from a theoretical scheme, became definitely a technic, which like all technics was to be perfected in actual practice. To understand the aims and purposes of intelligence testing it is necessary first of all to bear in mind the chronic grievance against schools and scholastic education. If the ordinary school examinations tested the practical capacity of the intelligence as much as they test the accumulated stock of book knowledge, there would never have arisen any need for special intelligence tests. While obviously the capacity to absorb book information and the ability to adapt oneself to new situations are not unrelated, it is none the less true that the two capacities are to a large measure autonomous and independent of one another. The question naturally arises why educators have for thousands of years persisted in measuring the parrot-like capacity for information instead of concentrating on the all-important faculty of general intelligence. The answer is quite simple. They had the instrument for measuring the first capacity but not for measuring the second. A written examination is a positive, we might even say scientific, measure of the amount of knowledge which a student possesses at the time he takes the test. To measure general intellectual capacities requires, however, something more than ink and paper. It requires judgment on the part of the examiner, and this judgment, if it is not to be capricious, must have for its support something corresponding to a general table of past performances. This support or tool has been lacking all through the ages, and it was supplied only through the perfection of statistical methods in the latter part of the nineteenth century. In point of fact, when we talk of measuring capacities we are really using a figure of speech to express our prediction of future actions. This prediction, to be reliable, must be

based on a proper interpretation of statistical probabilities, a task not at all simple and requiring expertness of a high order. All the disputes over the use of intelligence tests have hinged on the significance to be attached to certain statistical facts, and unfortunately there is no open sesame to the true analysis. While we may use mathematics to perfect our judgment, mathematics cannot make us dispense with the need for judgment.

The very notion of scales furnishes an interesting sidelight on the nature of the problem involved. Intelligence cannot be measured like certain chemical properties by the application once for all of a specific test. It is a growth; in other words, its manifestations vary with the age of the individual. Hence the necessity of constructing scales of tests, each test representing what experience has shown to be the average aptitude for a given age. The Binet scale was standardized on the basis of 400 Parisian school children. The tests were graded from the ages of three to 16. The intelligence of a child of three, for instance, was estimated on his ability to show nose, eyes, and mouth, his fluency in repeating number digits, etc. For later ages the tests were increasingly abstract, and it is indeed the general opinion that the upper tests of the Binet scale measure more than anything else the ability for abstract thinking. A school child was said to have the intelligence of that age all of whose tests he succeeds in passing. The natural thing to do then was to compare the mental age with the chronological age, but instead of measuring the discrepancy between the two, Binet found it more advisable to calculate their ratio. This ratio is the famous Intelligence Quotient or I.Q. It was seen to remain more constant for a particular individual than the arithmetical difference between the two ages. Thus it meant nothing to say that a child was one year ahead or behind his class, for a year at 12 and a year at six did not have the same significance. The intelligence quotient, representing as it did his classification among his peers, seemed to go with the child through all his years.

In importing the Binet scale into the United States it was found necessary to make extensive revisions in order to overcome differences of language habit. The Stanford revision was standardized on the basis of some 2000 children and adults. It postulated with the Binet system that the intelligence age of the average adult is 16—but properly speaking all that this means is that the tests measure a certain kind of growth up to the age of 16. Beyond that age different factors enter into consideration. The re-tests of individual children carried out at Stanford University seemed to confirm the relative constancy of the I.Q., successive determinations never varying more than 10 per cent. The Stanford-Binet scale is the most widely used of those embodying the principle of the I.Q. Its disadvantage of requiring individual examination has stimulated the development of group tests, graded by point scores. Of this type the best-known is the Yerkes test, under which partial credits are given for partial performance and the individual point score compared with the average point score for a chronological age. The resulting ratio is known as the coefficient of mental ability and differs from the intelligence quotient in that certain inferences cannot be made from it. In addition to

these two general types of mental tests, there are several devised to measure particular abilities and character traits. While all of them have some diagnostic value when interpreted by competent persons, the usefulness of the tests when applied by routine examiners is questionable.

United States Army Tests, 1917-19. The great importance of the army tests lies in the large number of subjects examined. The printed report, published in 1921 as a memoir of the National Academy of Science, has the magnitude of a volume of census returns. Altogether, in the period between September, 1917, and January, 1919, 1,726,966 men, including 42,000 officers, were tested. The vast majority were examined by means of group tests, but individual tests to the number of 82,500 were also given. The two general tests used by the army were the Alpha, a group test for literates, and Beta, a group test for foreigners and illiterates. All the tests, individual or group, employed the method of point score and partial credit, and the scores were later converted into letter grades. For the purpose of this conversion the tests were speeded up so that only 5 per cent could obtain the A grade. This procedure, justifiable from the point of view of statistical convenience, proved a source of much popular misconception. The device did not in any way affect the relative standing of the different individuals, but it did affect decidedly the sociological use to which some of the test statistics were afterwards put. Popular writers pointed with alarm to the fact that less than 15 per cent of the army recruits were A and B men and that the majority were C-, D and D-. When the letter grading was transmuted into the Binet-Stanford system of mental ages, the way was opened for a misinterpretation even more serious. The comparison of the Stanford and the army scales was made by means of 653 soldiers, who were tested by both methods. On this weak bridge the entire array of scores was transported, and when the battle was over, it was found that the average mental age in the army had dwindled to 13 years and 4 months. The assumption of the Binet-Stanford tests was of an adult mental age of 16, but it should be remembered that these mental ages, even granting that they are applicable to adults, were standardized on the basis of what 80 per cent of a given age were able to pass. This norm has been criticized as being altogether too high, and it is evidently one of the factors at any rate responsible for the depression of the army's mental age.

It is naturally impossible in the space of this article even to begin to analyze either the detailed statistical results of the army examinations or the equally vast amount of scholastic computations that have accumulated since the official tests. Nevertheless the leading questions may be profitably discussed without recourse to complicated mathematics. The most important of these is obviously the question of the intelligence itself. A critically minded psychologist has observed that we should avoid all confusion if we only defined intelligence as that which the intelligence tests test. Unfortunately this solution is too simple to meet the problem. The intelligence tests were constructed not without certain preconceptions as to the functioning of the intelligence in the popular sense of the term. Yet it is necessary to consider the

intelligence tests independently of the reality they were constructed to measure, and to regard the intelligence quotient as the technical I.Q. of the Binet-Stanford scale not to be interpreted outside of its context. When we wish to compare the I.Q. with the intelligence as each of us conceives it, we must make a separate judgment. The distance between the I.Q. and the popular conception of intelligence may become ever so much smaller, either through the perfection of the tests or through a change in the popular conception, but there will always remain the necessity for comparison. The fact is generally admitted that the Binet-Stanford tests emphasize a certain kind of ability at abstract thinking. Now it may be true that human civilization has progressed through the perfection of abstract thought, but so long as we do not all of us feel a moral obligation to become mathematicians, it is not necessary to take the I.Q. rating too seriously. The intelligence tests do detect feeble-mindedness, but even feeble-mindedness is in the last analysis a judgment of society. Those who are congenitally unable to live up to the requirements of social life are segregated into institutions. The intelligence tests are able to detect feeble-mindedness only because in some degree they are representative of the existing social order. But it is far from necessary to possess a high I.Q. in order to enjoy in our republic the right to life, liberty, and the pursuit of happiness.

When we turn to the problem whether intelligence is hereditary, we come up against a maze of difficulties. In the first place, we must of course distinguish between intelligence as tested by the tests and intelligence as we conceive it to exist; even then we must leave room for errors of conception. Practically the only guide we have to the problem is the general notion that all things biological represent a growth or an evolution. It is customary to decompose this evolution into two sets of factors, environment and germ plasm. But these two sets of factors are after all abstractions on which we dare not base too far-reaching conclusions. The only proper use we can make of this analysis is to regard biological growth for any short period of time as translatable in terms of a mechanism of action and reaction. But this mechanism is only a rule of thumb which cannot be applied over long stretches of time without leading to absurdities. In the case of intelligence, opposing schools have stressed either one or the other of the two sets of factors, either germ plasm or environment. Those who have upheld the germ plasm theory have made the environment a passive spectator of a predetermined evolution of the germ plasm, on the other hand, the environmentalists have made the germ plasm a helpless *tabula rasa*, on which the external world writes what it will. The complexity of the problem is further evident when we realize that it has been impossible to frame any general and consistent theory of heredity that will account for the transmission of the grosser physical characteristics. It is not that heredity is a pure matter of chance but rather that we observe very little of the process. Intelligence, if we define it in Aristotelian fashion as the cutting edge of the individual, is probably more subject to environmental influence than the general frame, which in the long run, as we know, also evolves. In one sense we are sharpening or

blunting the blade by every specific act that we perform, but in another sense the general sharpness or temper remains stable. It is therefore quite plausible to assume that the general brightness of an individual may become visible in the period of school age, without arguing either for the predetermining of this brightness by heredity or the predetermining of the individual's future life by this brightness. The first assumption, if allowed to prevail, would mean the end of democracy and the inauguration of government by the hereditary I.Q. The acceptance of the second assumption would mean the end of all competition for honors and places, the entire extinction of the social struggle for existence. Needless to say, both of these assumptions would be far-fetched even if the intelligence scales were 100 times as accurate as they pretend to be at present and 100 times as representative of the true capacities of the human individual.

In conclusion we may touch on the question of racial differences. It is well-nigh useless to refer the uninitiated reader to the statistics on the subject because of the startling contrast between the microscopic accuracy of the arithmetical calculations and the hasty generalizations on which the calculations are based. The army examiners, employing a nonverbal performance test for illiterates and foreign-born, found evidence of superiority on the part of the native white stock over the recent immigrants from southern and eastern Europe and more particularly over the negro stock. The figures are difficult to interpret in view of the fact that the northern negroes, whose difference from the southern negroes is social rather than racial, were able to make an enormously better showing. It seems questionable whether the influence of language and other environmental factors was sufficiently eliminated even in the Beta test. The claim has therefore been made that the tests favored the habits of mind of the native white stock at the expense of the other stocks. That there are racial differences seems probable from all the biological and anthropological evidence on the subject. But we have no really sure way of estimating the extent of these differences except by the biological test that there is no natural bar to the cross breeding of the most distant races. As regards the subraces, peoples, and nationalities, it is for heuristic reasons best to consider the social reality as the changing element and the hypothetical germ plasm as relatively one. To do anything else would make the writing of history impossible. Instead of studying French civilization and German *Kultur*, we should then have to concentrate on the metaphysical *Ding an sich* of Gallic and Teutonic germ plasm.

Bibliography. Books on intelligence testing are legion. Pinter's *Intelligence Testing, Methods and Results* (1923) may be recommended to the elementary student. Terman's *Measurement of Intelligence* (1916) and *The Intelligence of School Children* (1919) give the point of view of the leader of the Stanford school. Vol. XV of the *Memoirs of the National Academy of Sciences*, entitled "Psychological Examining in the United States Army" (1921), is an indispensable work of reference. A good controversial discussion of the subject, induced by Walter Lippmann's attack on the army tests, may be found in the 1922 and 1923 volumes of *The New Republic*, and more scientific discus-

sions in the psychological periodicals, particularly *The Journal of Educational Psychology*, vol. xii and vol. xiii.

MENZIES, ALAN WILFRID CRANBROOK (1877-). An American chemist, born at Edinburgh, Scotland. He was graduated at Edinburgh University and later studied at Aberdeen, Leipzig, and the University of Chicago. He was assistant professor of chemistry at Henriot-Watt College in Edinburgh and professor of chemistry at Mungo's College at Glasgow. Meanwhile he also organized and directed (1904-08) summer courses for science teachers in Ireland. In 1908 he came to the United States and became connected with the chemical department of the University of Chicago (1908-12), and during 1912-14 he was professor and head of the department of chemistry at Oberlin. He resigned from Oberlin in 1914 to accept a call to the chair of chemistry at Princeton. He was also associate chemist with the Bureau of Standards in Washington (1918-19). His original researches were chiefly concerned with matters of physical chemistry, such as vapor pressure and vapor density, molecular weights, ebullioscopy, and hygrometry.

MERCHANT MARINE. See SHIPPING; SHIPBUILDING; etc.

MERCERIZATION. See TEXTILE MANUFACTURING.

MERCIER, DESIRÉ JOSEPH, CARDINAL (1851-1925). A Belgian prelate of the Roman Catholic Church (see Vol. XV). During the War he was uncompromising in his opposition to the hardships imposed on the Belgian people by their German rulers and unceasing in his demands for the betterment of conditions. One of his pastoral letters, an eloquent exposition of the civic and national rights of Belgium, resulted in his arrest in January, 1915. Soon released, he remained throughout the German occupation a thorn in the side of the German officials and administration. He was one of the great figures of the War. In 1919 he published *War Memories*. He also wrote several books on philosophy, including *A Manual of Modern Scholastic Philosophy* (1917). In 1922 he visited the United States and was received with great honor.

MERCURY. See QUICKSILVER.

MERCURY BOILER. See BOILERS.

MEREDITH, EDWIN THOMAS (1876-). An American agriculturalist and public official, born at Avoca, Iowa, and educated at the Highland Park College in Des Moines. For several years he edited agricultural papers in Des Moines. In 1902 he established *Successful Farming*. He was a director in many financial institutions and was also active in politics. In 1914 he was a candidate for United States senator and in 1916 for governor of the State of Iowa. He served on the Industrial Conference in 1919 and was a member of several other boards engaged in agricultural investigations. In 1920-21 he was Secretary of Agriculture in the cabinet of President Wilson.

MERRIAM, JOHN CAMPBELL (1869-). An American palaeontologist (see Vol. XV). In 1919 he was chairman of the National Research Council, and in 1920 he became president of the Carnegie Institution at Washington, D. C. He was a member of many scientific organizations.

MERRILL, ELMER DREW (1876-). An American botanist, born at East Auburn, Me.,

and educated at the University of Maine and George Washington University. After serving on the faculty of the University of Maine and with the Department of Agriculture in Washington, he was appointed botanist by the Bureau of Agriculture at Manila, P. I., in 1902. From 1903 to 1905 he was in the service of the Bureau of Government Laboratories, and from 1906 he was connected with the Bureau of Science. In 1912 he was appointed associate professor of botany and head of the department at the University of the Philippines, where he became full professor in 1916. In 1919 he became director of the Bureau of Science in Manila; in 1923, dean of the California College of Agriculture. Professor Merrill carried on many investigations in the Philippines and elsewhere and described more than 2500 new specimens of plants. He was a member of many scientific societies and the author of *A Flora of Manila* (1912), *Enumeration of Bornean Plants* (1921), and many articles on the botany of North America, China, the Philippines and Malaya.

MERRIMAN, MYRA HUNT KINGMAN (Mrs. JOSIAH C. MERRIMAN) (1873-). An American editor and writer, born at Tremont, Ill. She studied journalism, civics, and philanthropy at the Illinois State Normal School and was for many years a member of the editorial staffs of several papers in Chicago. She also acted as traveling South and Central American correspondent for newspapers. In 1894 she became a member of the staff of several papers in California. During the War she was a member of the board of directors of the Bureau of Registration for Woman's Service and was a member of several other important committees. She was secretary of the National Council of Women of the United States in 1920-21 and was a delegate to the International Council of Women in 1921. In the same year she was chairman of the official delegation of 40 women which investigated conditions in Europe.

MESOPOTAMIA, or IRAQ. A British mandate territory, lying between the Tigris and Euphrates Rivers and made up of the former Turkish vilayets of Bagdad, Basra, and Mosul. Area, 143,250 square miles; population in 1920, 2,849,282. The population is largely Arab by race and Mohammedan by religion. Turks, Kurds, Jews (in the towns), Christians belonging to Roman Catholic and Syrian Catholic churches, and some Persians were also to be found. By religions the population was divided into 1,146,684 Sunnis and 1,494,015 Shiahhs (both Mohammedan), 87,488 Jews, 78,792 Christians, and 42,302 others. Basra, at the head of the Persian Gulf, was the chief town; Bagdad was next in importance.

Industry and Trade. Agriculture was the leading activity of the population, and wheat, barley, and rice were grown in considerable quantities. Irrigation was indispensable even in the northern regions and was a constant concern of the government. In 1919 the ancient canal, Saqlawiyah near Felliyyah on the Euphrates, was reopened for the service of some 70,000 acres in winter and 36,000 acres in summer. The importance of the rôle played by irrigation may be gauged from these items in the 1919-20 budget: irrigation maintenance, \$648,800; new projects, \$2,358,388; flood protection maintenance, \$778,560; flood protection, new works, \$389,280. Other canals opened after the War were the Yousoufieh to serve Bagdad, the

New Khalis from the Dial River, the Beni Hasan, and the Georgivah, both from the Euphrates. Agricultural experiments indicated the feasibility of cultivating cotton, tobacco, and ground nuts. Dates, as always, figured in the economic life of the country, and sheep were tended in the Mosul region. The lack of farm labor and limited funds retarded development. Local industries, concerning themselves with tanning and weaving, were to be found in the towns. Into the export trade, dates, grains, carpets, and wool, of the native products, entered largely, while piece goods, carpets, sugar, and tea were reexported from Bagdad particularly via the caravan routes. After the War cotton goods made up nearly half the total imports, the depletion of stocks and the demands from Persia because of the closing of the northern routes accounting for the increase. Other imports were sugar, coming via India from Java and China and destined for Persia and Mesopotamia (11 per cent of total in 1919); tea from India and Ceylon for Persia (35 per cent of total in 1919); silk (35 per cent of total in 1919), tobacco; metals and ores; soap. Total imports at the port of Basra for 1912, 1919, and 1921 were £2,653,000, £9,326,000, £7,237,000 (to this must be added the imports of Bagdad, 1919, £2,940,000; 1921, £6,470,000); total exports at Basra for 1912, 1919, 1921 were £3,246,000, £2,406,000, £1,898,000 (Bagdad, 1919, £4,940,000, 1921, £4,658,000).

Communications. River transportation continued to occupy a prominent place even after the War; particularly extensive improvements were made in the Tigris. The navigation of the two rivers was as before, controlled by a British company. Basra was the scene of great harbor developments as well. Up to 1914 the only railway line was the standard gauge branch of the Bagdad railway from Bagdad to Samarra (75 miles). However, military exigencies caused the construction of the following: Basra to Nasiriyah (140 miles), Basra to Amara (109 miles), Kut-el-Amara to Bagdad (105 miles), Bagdad to the vicinity of Khanikin (103 miles), and thence to the Persian frontier. The Bagdad railway line was extended to Tekrit, and then, after the Armistice, on to Qalat Sharqat (total 186 miles). In all, some 1100 miles of line were built for military purposes. An outstanding event was the opening of the line from Basra to Bagdad (354 miles) in January, 1920, which made possible a comfortable train ride of 22 hours from city to city. The line from Bagdad to the Persian frontier at once reduced freight rates and thus facilitated intercourse.

Minerals. Oil was reported to exist in rich quantities north from Mandali to Bagdad. The Anglo-Persian Oil Company obtained concessions to work some of these fields. Wells were sunk at Quaiyarah, but in 1923 the yield was still inconsiderable. Asphalt was found at Hit on the Euphrates.

Government. Revenues for 1918-19 were £2,080,000 and expenditures, £1,117,000; for 1919-20, revenues were £3,437,000 and expenditures £3,692,000. Customs revenue, which forms about half the annual receipts, amounted in 1920-21 to £1,426,288; 1921-22, £1,622,232. The British forces stationed in the country were under the control of the Air Ministry; the local Iraq army was in the process of formation. The constitution, as finally completed late in 1923, contained many liberal sections, at the

same time that it showed the restraining hand of British influence. The usual constitutional guarantees were given: freedom for race, religion, language, and of speech, assembly, and worship; the Emir, however, was sovereign and irresponsible, although all edicts were to be signed by the prime minister; there was to be a nominated senate and an elected chamber to which the ministry was to be responsible; validity was assured for the laws of the Ottoman régime and the British occupation, an arrangement interpreted by observers as applying to the oil concessions held by the Anglo-French Petroleum Company; and all concessions and monopolies were to be granted only in accordance with the law.

History. The Tigris-Euphrates valley, as rich in historic associations as in natural resources, had been a focal point for the conflicting imperialist aspirations of Germany and Britain from the very inception of the Bagdad Railway, at the close of the nineteenth century. In June, 1914, on the eve of the War, Great Britain and Germany reached a secret agreement, not published until 1923, whereby Basra was to become the terminus of the railway, navigation rights in Mesopotamia were reserved to the British, and irrigation in lower Mesopotamia was to be undertaken by Great Britain. About the same time, the two Powers agreed, and Turkey provisionally assented, that an Anglo-German syndicate, 75 per cent British and 25 per cent German, was to obtain a concession for exclusive oil prospecting in Mesopotamia. This bargain, however, failed to receive final approval before the outbreak of war in 1914. Even before Turkey entered the War, London ordered British troops to concentrate against Mesopotamia, in September, 1914, to occupy Abadan Island at the head of the Persian Gulf, and to take further belligerent measures if necessary to protect the Anglo-Persian Petroleum Company's refineries, tanks, and pipe lines in southern Mesopotamia. After Turkey declared war, Indian troops were disembarked on the shores of the Shatt-el-Arab, occupied the city of Basra, on Nov. 22, 1914, and advanced upstream. General Townsend's ill-starred campaign against Bagdad, General Maude's later and more successful attack on the city, and the other military operations of the War are described elsewhere (see *WAR IN EUROPE, Turkish Front*).

In the occupied area, the British zealously courted the favor of the native Arabs by making concessions to native customs, by tactful treatment of Mohammedan religious interests, and by more than generous promises to Arab nationalism. After occupying Bagdad, General Maude issued a proclamation inviting the people to participate in the government, so that they might unite with the Arabs of other regions in realizing their racial aspirations. Meanwhile, however, by the secret Sykes-Picot Treaty of 1916, Great Britain and France had made an anticipatory division of the spoils, assigning Mesopotamia to Great Britain. The unrati-fied peace treaty of Sévres (1920), and likewise the definitive treaty of Lausanne (1923), deprived Turkey of sovereignty over Mesopotamia; and the latter treaty left for future solution the problem whether Mosul should be included in the ceded area. The Mosul region was peculiarly attractive as an oil field reputed to be of vast value; it had been allotted to France

by the Sykes-Picot Treaty, transferred to England by another Anglo-French bargain in December, 1918, and included in the British mandate for Mesopotamia, notwithstanding Turkish protests on the score of self-determination. At the San Remo Conference of April, 1920, the Allies conferred on Great Britain a Class A mandate over Mesopotamia, and an Anglo-French oil agreement was concluded, whereby a 25 per cent share of the future oil output of Mosul was granted to France, and a pipe-line was to be constructed through Syria as an outlet for Mesopotamian oil. Against this oil agreement the United States government entered a vigorous protest, in a note dated Nov. 20, 1920; at the Lausanne Conference in 1923 the American delegation blocked a British attempt to obtain Turkish confirmation of the predominantly British Turkish Petroleum Company's monopolistic concession. The controversy regarding the Mosul oil field was further complicated by the Chester Concession (q.v.) and by claims advanced in behalf of Abdul Hamid's heirs. The British oil interests, it was unofficially reported, made efforts to conciliate Washington by quietly offering the several American claimants minor shares in Mesopotamian oil. In the meantime the uncertainty prevailing in regard to the future status of the country had encouraged the development of a strong nationalist agitation by young Arab officers, who quoted Wilson's speeches and various English and French manifestoes to prove Mesopotamia's right of self-determination. Popular antipathy to the efficiency of British tax collectors, to forced labor on irrigation works, and to British disregard of tribal and religious leaders, provided additional fuel for the smoldering fires of discontent which burst into open rebellion in 1920. The British army of 60,000 men had to be increased to 90,000 before the revolt was quelled, in December, 1920. Under these unfavorable circumstances the British endeavored to create the administrative machinery to fulfill their mandate. In the autumn of 1920 a Council of State was set up, under the tutelage of Sir Percy Cox, the British High Commissioner. Insistent Arab demands for a native government, reinforced by equally insistent protests by English taxpayers against the large military expenditures in Mesopotamia, whose cost, from the Armistice to the end of 1921, was estimated at £100,000,000, led the British government to consider favorably the claims of Prince Faisal (q.v.), son of the King of Hedjaz. The Council of State on July 11, 1921, unanimously offered him the crown, and after an almost unanimously favorable but hardly democratic plebiscite, 96 per cent for Faisal, he was officially proclaimed King of Iraq, at Bagdad, Aug. 23, 1921. The new kingdom of Iraq, nominally a sovereign state, was nevertheless subject to British supervision under the mandate, and to clarify this relationship, a treaty was signed on Oct. 10, 1922, by which Iraq agreed to be guided by the advice of the British High Commissioner in financial, military, and international matters, and Great Britain promised to facilitate Iraq's entry into the League of Nations, in due course. A subsequent protocol, signed Apr. 3, 1923, fixed the term of the earlier treaty, and implicitly of the mandatory relationship; the treaty was to terminate either on the entry of Iraq into the League or four years after the ratification of

peace with Turkey. The independence granted to Iraq was evidently of a very limited nature. The British continued to supervise native administration in the vital departments, a British Civil Administration continued to function temporarily side by side with Faisal's government, and the British Royal Air Force remained in military control of the country. In 1922, to give one instance of British policy, the minister of the interior was exiled to Ceylon because of his too pronounced nationalist views. The constitution or Organic Law drafted in 1923 and approved by the Council of Ministers made Mohammedanism the state religion and Arabic the official language, but assured equal civic rights to all, regardless of creed or race. Its political clauses provided the customary machinery of parliamentary government, with a responsible cabinet, but a sudden transition from Turkish oppression and tribal decentralization to genuine democracy, in a country with little popular education or political experience, could be hoped for only by the most optimistic of patriots. When the Constituent Assembly was inaugurated at Bagdad, Mar. 28, 1924, for the purpose of ratifying the Organic Law and the British treaty, strong opposition to the latter was promptly manifested. By this time it had become public knowledge that the treaty, with subsidiary agreements, including one dated Mar. 25, 1924, would enable Great Britain to maintain troops in Iraq until 1928 and perhaps longer; to train the native army, and to appoint administrative advisers for 15 years or more. The Arab kingdom, it appeared, was after all merely a British protectorate, confronted with political, educational, and financial problems of the utmost gravity but endowed with natural resources which might, under able management, enable the people to lay the economic and cultural foundations for genuine self-government in the future. On June 11, on the last day allowed the government by the British, the Iraq parliament approved the treaty and British control was accepted.

MESTROVIĆ, IVAN. See SCULPTURE.

METALLURGY. See COTTRELL PROCESS; ELECTRIC FURNACES

METCHNIKOFF, ELIE (1845-1916). (See Vol. XV.) The death of the distinguished savant occurred at the age of 71. It appeared after his death that he had, whether by art or nature, overcome the handicap of short life which beset his near kin, none of whom had exceeded 55 years. He had drunk his artificially soured milk faithfully each day for 19 years and considered that his doctrines of survival had been upheld in his own case. His widow, Olga Metchnikoff, has written his biography.

METEOROLOGY. The decade 1914-24 witnessed a great expansion of the meteorologist's activities through increased emphasis on meteorology in military operations, aviation, agriculture, weather insurance, and numerous commercial and industrial fields. A prodigious advance was made in the organized collection and dissemination of weather information over land and sea by telegraph, cable, and radio. Daily synoptic charts now cover the larger part of the northern hemisphere, including the ocean areas, and the systematic exploration of the upper air by kites and pilot balloons has increased markedly in amount; appreciable improvement in daily weather forecasts has re-

sulted. Correspondingly rapid progress has been effected in the theoretical meteorology.

By 1924 several capable physicists and mathematicians were at work on the foundations of weather forecasting, and order was slowly being evolved out of chaos, although as yet it was possible to supplement empirical knowledge of many phenomena with only partial explanations on physical and dynamic grounds. While the time seems remote indeed when forecasting can wholly cease to be an empirical art, nevertheless every advance, however small, in our theoretical understanding of the physical processes going on in the atmosphere provides increased insight which cannot fail sooner or later to react on meteorological practice and to lead to improvement in forecasting.

Meteorological Observations. To provide a solid basis for the improvement of day-to-day predictions, for the extension of forecasts over longer periods of time, and for the development of the mathematical theory of atmospheric phenomena, we need an adequate body of both surface and free-air observational data from land and sea, together with a skillful coordination of these facts of observation by the mathematician and physicist. Nothing can be done without sufficient observations, but facts do not as a rule explain themselves, and we cannot hope by simply looking at maps to reach the solution of our problems.

Moreover, there is no indication whatever that in order to reduce atmospheric phenomena to law it is necessary to discover new physical laws at present unthought of, or, despite the unfounded claims of some investigators, to seek the solution in some vague, hitherto unrecognized cosmic or electromagnetic influence.

Observational and Statistical Meteorology. The temperature of the air falls at an average rate, nearly the same in all parts of the world, of about 6°C per kilometer increase of height up to an altitude which, according to latitude, season, and surface barometric pressure, varies from about 9 to 16 kilometers, beyond which the temperature ceases to fall in a vertical direction. This upper layer of zero lapse rate is called the stratosphere or isothermal layer; the lower region is known as the troposphere. The temperature of the stratosphere is below 200° Absolute over tropical regions, but is greater in higher latitudes and is above 220° Absolute over northern Europe. Roughly, the mean temperature of the air column from the surface to 20 kilometers is the same, and hence the pressure at 20 kilometers is the same, the world over. The diurnal temperature variation at the surface extends upward only one or two kilometers; the annual temperature variation in the troposphere diminishes somewhat with height and is quite small in the stratosphere. The tropopause, or boundary between troposphere and stratosphere, is relatively low in cyclonic areas, high in anticyclones.

To understand fully the weather of any given locality, and to anticipate its changes to any great extent in advance, it is necessary to take a worldwide view. Cold waves, periods of drought, abnormal seasons, etc., are intimately connected with the prevailing distribution of barometric pressure, and the resulting general circulation, over an entire hemisphere. Profound modifications of the pressure distribution are often first indicated in polar regions. Loss of heat from these regions results in the ac-

cumulation of great volumes of cold air which sooner or later must break out over lower latitudes and cause great periodical readjustments of pressure distribution over the hemisphere, and these in turn determine the winds, storm paths, and weather conditions in general.

So many factors are operating simultaneously and in such a complex manner to determine exactly what sequence of phenomena shall take place that it is hopeless to attempt to work out the relations involved *a priori* from theoretical considerations. Our immediate efforts must be directed toward ascertaining these relations empirically; the methods of mathematical statistics have come into extensive use for this purpose. The method of correlation has been used in the hope of empirically discovering relations which would be of value in long-range forecasting, but in general the correlation coefficients obtained up to 1924 are too small to render this method highly successful; prediction requires highly correlated variables. The present position of long-range forecasting in general is not at all hopeful; forecasts for more than a few days in advance, by whatever method, are made only at a great sacrifice of detail, and are most uncertain. Fair success has attended G. W. Walker's forecasts of the monsoon rainfall of India by the use of the correlation coefficients between the amount of this rainfall and sundry meteorological conditions over various parts of the globe in the spring of the same year or earlier. On the other hand, if correlation is resorted to only for the purpose of discovering relations between different phenomena, a small coefficient, if sufficiently larger than its probable error, is just as likely to give valuable information as a large one, although the interpretation of the coefficients frequently is difficult and uncertain, and the physical reasons for their existence impossible to assign.

The highest correlation coefficients found are those of Dines between pressure and temperature at the same levels in the upper air. Close to the surface the correlation between pressure and temperature is quite low, but from 4 to 8 kilometers the coefficients are well over 0.90, and when corrected for errors of observation some of them seemingly become unity, and this indicates direct proportionality between pressure and temperature at those levels. The surface temperature is governed by many factors, such as time of day, state of sky, etc., which higher up are absent or of lesser importance. Dines holds that the chief item in determining the temperature in the upper air is the dynamic heating and cooling due to vertical movement, while C. K. M. Douglas on the other hand maintains that the temperature variations in the upper air are mainly the result of the passage of different air currents, the temperatures of which depend on their place of origin and are low if the air comes from the far north, even though it may curve around a cyclone and arrive at the place of observation from the southwest.

Undoubtedly the relative importance of vertical motion and horizontal transport varies according to the geographic location of the place of observation and the height. From a summary of aerological data obtained in the United States, Gregg finds that south component winds are considerably warmer than north component winds at all levels in the troposphere, except when there is a temporary reversal in the

latitudinal temperature gradient or when the air follows a curved path around a cyclone or anticyclone, although the relation is somewhat more pronounced at one and two kilometers than above or below that height. A statistical study of kite data enabled Meisinger to devise a practicable and reliable method of constructing isobaric charts for the one and two kilometer levels over the eastern United States at 8 A.M. from surface data alone.

Climatic Changes. Some investigators hold that the earth is undergoing a gradual desiccation, but the consensus of the most expert meteorological judgment is that there is not as yet sufficient unimpeachable evidence to justify a belief in any progressive change of climate within historic times in any part of the world. Small and more or less periodic fluctuations, such as those accompanying the sunspot cycle, now exist, and can be traced back into the past through the evidence afforded by growth rings in large trees and other things; and the existence of well-marked local fluctuations of climate in the past is well established. So far as climatic changes during geologic time are concerned, there is a decided tendency to seek their explanation in purely terrestrial causes, with a lessened appeal to astronomical factors. The work of Humphreys and others has shown that dust veils in the very high atmosphere due to great volcanic explosions are effective in somewhat diminishing earth temperatures and may have been a contributing cause to the ice ages.

Atmospheric Circulation. At first sight it might seem natural that the motion of air should be directly from regions where barometric pressure is high to regions where it is low, but the most casual examination of a weather map shows that this is not the case; it is indeed the primary tendency, but this tendency is almost completely checked by the effect of the earth's rotation, and we get instead a circulation practically *parallel to the isobars*. The only forces acting on a particular volume of air are gravity, hydrostatic pressure, arising from the action of gravity on the rest of the earth's atmosphere, and friction, including internal friction due to viscosity and turbulence. The acceleration of the air under these forces is composed of two parts, acceleration relative to the surface of the earth, which is observable, and acceleration common to this surface itself, the latter giving rise to the so-called deflecting force of the earth's rotation. After a steady state has been attained, which takes but a brief time, *in the absence of friction* the direction of the wind is *along the isobars*, and the velocity is so adjusted that the force arising from the pressure gradient, tending to push the air in toward the region of low pressure, is just balanced by the tendency of the moving air to turn to the right, in the northern hemisphere, because of the earth's rotation, together with the outward tendency due to the centrifugal force arising from the curvature of the path. This resulting wind is known as the *gradient wind*. In the strata near the ground the retardation due to friction causes the air to lose some of the velocity necessary to maintain the balance, and the wind direction is more or less inclined away from the isobars toward the lower pressure.

If, as in lower latitudes, the influence of the earth's rotation is relatively small and friction is negligible, the pressure differences between

points at the same level in the atmosphere are mainly occupied in producing acceleration relative to the ground in accordance with the ordinary laws of hydrodynamics; that component of the gradient wind determined by the centrifugal force known as the cyclostrophic component is alone important as soon as the wind reaches a very moderate velocity. Such winds, which have been called Eulerian by Jeffreys, are exemplified in the tropical cyclone. If, as is generally the case in the comparatively slow-moving extratropical cyclone, the cyclostrophic component is negligible, the pressure differences are mainly occupied, in the absence of friction, in guiding the air under the influence of the earth's rotation, the resulting winds are known as geostrophic. If, as in land and sea breezes, friction is the main thing which the pressure differences have to overcome, the winds blow in the direction of the gradient, but without acceleration, and have been styled by Jeffreys antitriptic winds.

In the absence of direct observation, the gradient wind indicated by the surface pressure chart is the best estimate which can be given of the actual wind at an elevation of 1500 feet. For much greater heights, the surface map may fail to give a correct idea of the pressure distribution there. The law of approach from the surface wind to the undisturbed gradient flow above is very complex; a number of empirical formulas have been devised to express the variation of velocity with height in the lower levels, the best of these is probably one due to Chapman. The greatest insight into the motion of the air in the lowest strata has been given by the mathematical theory worked out since 1914 by G. I. Taylor, L. F. Richardson, F. J. W. Whipple, and others.

Friction and surface irregularities put the lower air into a very turbulent state; whirls and eddies of varying sizes are constantly being formed and reveal their presence in the gustiness of the wind and in the dispersion of the smoke from a chimney. While the spin of an eddy is maintained, the mass of air composing it is endowed with a special forced motion, but presently the eddy disintegrates, and the air which has been forcibly transported in the eddy mixes with its new surroundings. The result, even in the lightest wind, is the mixing of adjacent layers of air; the air transported by the eddies carries with it its momentum, heat, and water vapor, and thus the eddy motion causes a gradual diffusion of these in accordance with laws identical in form with those governing the diffusion caused by molecular motions. The lower layers gain in momentum and generally in heat, at the expense of the upper; the effect is to endow the lower atmosphere with a virtual or pseudoviscosity many thousand times greater than the ordinary molecular viscosity, and with a correspondingly great eddy conductivity for heat and for water vapor. The values of these coefficients of eddy conductivity and eddy viscosity depend on the configuration and nature of the ground surface, the temperature of this surface, the time of day, season, cloudiness, etc. Above the first one or two kilometers the influence of surface turbulence may generally be regarded as eliminated. Eddy motion or atmospheric turbulence has been found to play an important part in the diurnal and seasonal variations of wind velocity, and in the formation of clouds and fog.

Cyclones. The instantaneous picture provided by the synoptic chart gives no indication of the true trajectories of the moving air; when these trajectories are worked out by special investigations, it is found that the cyclone is not composed of the same air circulating round and round the centre as the storm travels. Also, the maps show no signs of the distribution of temperature, wind, etc. which the existence of a vortex would imply; hence for some time the old vortex theory of extratropical cyclones has been in disfavor. Nevertheless, a vortex theory can be made to account for many facts of observation, and it may be shown that under the actual circumstances of the case it would be difficult or impossible to recognize the presence of a vortex, particularly from the surface map, even if one existed.

We know that the air is full of imperfect whirls or eddies of all sizes; and Fujiwhara has recently shown that under suitable circumstances large vortices are built up through the absorption of the energy of the numerous small whirls into whirls of the next larger size, and so on, and similarly a large vortex dissipates by successively developing series of vortices of the next lower order. Rayleigh in 1917 showed that, provided there were already some vorticity

in the atmosphere, all that was necessary to effect the development of a single large vortex was the removal of air from the region that would form the core. Thus the initial step of adding energy to the existing small imperfect vortices which we know to be in the air could be effected by removing a part of what would be the central portion of the resulting cyclonic vortex.

The old thermal convection theory of cyclones, which postulated the ascent of a large body of air as a coherent mass, is untenable, because it does not explain the observed relative coldness of the troposphere in cyclones. Sir Napier Shaw has suggested instead, as the process of the required removal of air, its eviction by a scouring action in the layers through which penetrative convection passes. The rising air drags up with itself a surprisingly large portion of these layers through eddy mixing; this might account for the development of a cyclonic vortex attended by a reduction of pressure and a consequent lowering of the temperature. Shaw's theory seems quite applicable to tropical cyclones, and appears capable of accounting for some at least of the extratropical ones.

On the other hand, the meteorologists of the

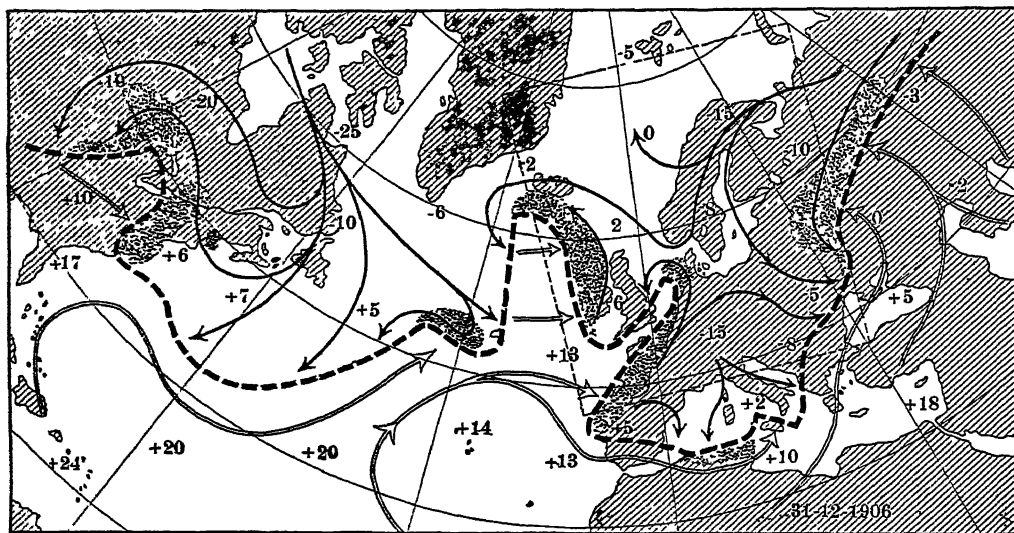

Vertical Section to South of Center

THE STRUCTURE OF THE NORMAL CYCLONE ACCORDING TO V. BJERKNES

Meteorological Institute at Bergen, Norway, have brought to light details of cyclonic phenomena, not known before, which have led them to quite another conception of the nature of an extra-tropical cyclone. Deprived of weather telegrams from the greater part of Europe during the War, the Norwegian meteorologists found their isobaric charts, which covered only a very limited area, of comparatively little use for forecasting, and they were led to a serious attempt to use in practice a method of forecasting which V. Bjerknes had originally evolved from theoretical considerations. Detailed reports from a very close network of stations revealed the existence in the normal cyclone of two lines of discontinuity, meeting at the centre and dividing the cyclonic area into quite unequal portions. These

the two fronts, apart from wet fog or drizzle, is attributed to the local instability of air passing over warmer sea or land; it is particularly prominent over the land in summer and over the sea in winter.

Detailed maps show that the line of discontinuity formed by the warm and cold fronts together extends continuously from cyclone to cyclone. After extensive experience with detailed maps, it becomes possible to recognize the line on less detailed ones, it is then found that the line completely surrounds the entire polar regions, and the name Polar Front has been given to it; the air on the northern side is of polar origin, that on the southern side of tropical origin. Heavy cold air flows out along the ground from polar regions, separated from

FRONT OF POLAR AIR, DEC. 31, 1906.

The rainstorm which is occurring near the Great Lakes arrived at the coast of Norway on Jan 5, 1907.

two lines mark the boundary of a projection of warm air, generally from the southward, into a region of cold air. The line running from the centre towards the eastern or advancing side is called the steering line, or more recently the warm front; under normal conditions it is marked by a rise of temperature, preceded by a considerable and prolonged fall of rain. The other line, running from the centre in a south-westerly direction, is called the squall line, or cold front; it is marked by a sudden fall of temperature accompanied by a brief shower of rain.

The cyclone is thus divided into a warm sector and the cold remainder. The lines of discontinuity have been explained as delineating the ground plan of a complicated surface of discontinuity which extends up into the free air and separates cold air of northern origin from warm air of southern origin. The rain in advance of the warm front is attributed to the general ascent of the warm air from the south up over the bank of cold air to the north, along a gentle slope; and the rain of the cold front is attributed to the undercutting of the warm air by the cold air in its rear with a somewhat steeper surface of separation. Rainfall in regions outside the two which are associated with

the overlying warm air by a surface of discontinuity. The Polar Front has a wavy form, cold and warm tongues of air alternately extending toward equator and pole and is in continuous undulating motion, sweeping the whole temperate zone from west to east, and producing the weather changes of temperate latitudes. At the northern ends of the warm tongues are the centres of the cyclones; the broad tongues formed by the expulsion of great masses of accumulated polar air are the anticyclones between. If a tongue of warm air extends too far, and a portion of equatorial air gets completely surrounded at the ground by colder air, the cyclone fills up and expires, and a secondary may develop at the point of overlapping of the two cold fronts. The poles are not of course the only possible sources of a discontinuity; the northern slopes of the Asiatic continent are an effective substitute, both winter and summer.

The above empirical representations of the facts of the synoptic charts have already proved of quite material assistance to forecasting in Norway. Bjerknes has, in addition, sought to give them a dynamic interpretation. He holds that the synoptic maps can be simulated by wave motion on either side of the surface of discontinuity. The discontinuity is considered

a natural consequence of the dynamic conditions of an atmosphere on a rotating globe. The cyclonic depressions of middle latitudes begin as convolutions of the surface of discontinuity due to the instability of adjacent warm and cold air in relative motion. At sea level they appear as collections of approximately circular isobars because the surface of discontinuity is not vertical but tends toward parallelism with the axis of the earth or even less inclined to the surface than this. The successive cyclones of the temperate zones are thus regarded as waves on the boundary surface between the cap of polar air and the surrounding warm air masses. The corresponding boundary line at the ground, the Polar Front, traverses the centres of depressions all the way around the earth. The extreme northern ends of the warm waves coincide with the centres of low pressure, and the cold waves of polar air between them constitute the moving wedges of high pressure. The examination of depressions individually, from their formation to their disappearance, shows that young depressions correspond to slight waves with small excursions from the equilibrium state; later, the amplitudes increase simultaneously with a deepening of the depression. The ascending currents starting from the warm wave gradually diminish the area of the warm sector of the cyclone. The tongues of polar air on both sides of it accordingly approach each other and finally close together, so that air of cold origin surrounds the cyclonic centre on all sides. The potential energy of the system of adjacent cold and warm air masses is then lost, and the cyclone begins to fill up. The missing asymmetry of structure makes the cyclone during its last stages slow-moving or stationary.

The warm, cold, and occluded fronts are now shown on the Norwegian weather maps, and forecasts are made in accordance with the principles of the Polar Front theory. In spite of

of both the vortex and the polar front theories, is needed. Alternative conceptions of the mechanism of extratropical cyclones recently put forward by Kobayasi and by Ryd lead to the squall line as a consequence, not a cause, of the cyclone.

Meteorological Tides. The Tidal Institute of the University of Liverpool, founded in 1919, did much valuable work looking toward forecasting the effects of winds and barometric pressure on tides and on the level of the sea in general. Hayford succeeded in evaluating the effects of winds, pressure, and seiches on the levels of the Great Lakes.

Mathematical Meteorology. As a matter of research, Bjerknes and his colleagues have tried to formulate a mathematical theory of the general circulation of the atmosphere considered as a circumpolar vortex, on the basis of the polar front theory and the hydrodynamics of fluids in which the density is a function of other variables besides the pressure. Incidentally, they have also attempted to work out the course of the future weather in a limited region by mathematical calculations based directly on physical laws applied to initial data as complete as possible, mainly by employing graphical methods to solve the differential equations which embody atmospheric processes. L. F. Richardson, in an admirable study of theoretical meteorology, has coördinated practically every physical and dynamic process of the atmosphere in one systematic set of differential equations and has applied the calculus of finite differences to obtain an approximate analytic solution which might be employed in computing the coming weather. The value of the insight into the mechanism of atmospheric phenomena which such studies provide cannot be overestimated, but of course the calculations of coming weather by such methods are so prohibitively laborious, and the available observational data on which to base them are so imperfect and incomplete at best, as to preclude any thought of the immediate direct application of such methods in practical forecasting.

Miscellaneous. Valuable studies of the radiation of the sun, the nocturnal radiation of the earth, the return sky radiation, and atmospheric radiation have been carried out by Abbot and his colleagues, Dorno, Ångström, Boutaric, Kimball, and others. Brunt has estimated the total kinetic energy of the general circulation to be 3×10^{27} ergs, and the rate of dissipation to be such that 2 per cent of the effective incoming solar radiation must be converted into kinetic energy to maintain this circulation. Clayton, in Argentina, has made the variations of the solar constant a basis for forecasts; but the claim that fluctuations in the solar constant are responsible for all weather changes can hardly be substantiated. What connection, if any, exists between changes in solar radiation and any special weather conditions that may follow remains to be established. Vegard has concluded that auroras are produced by streams of negatively electrified particles (presumably from the sun) passing through the high atmosphere. The lower limit of the aurora is most frequently found at 100 or at 106 kilometers. Streamers extending to an altitude of 500 kilometers have been observed. Vegard's observations indicate that all the lines of the auroral spectrum, including the enigmatic green line, are due to nitrogen.

In a new study of the composition of the up-

LIFE CYCLE OF A CYCLONE ACCORDING TO
V. BJERKNES

its great successes in correlating many of the facts of cyclonic phenomena, the theory has not been completely confirmed by such observations as are available to test it, nor is it altogether free from theoretical difficulties. Considerable further investigation, along the lines

per air, Chapman and Milne conclude that up to 110 kilometers nitrogen composes more than half the air, then becomes less predominant, until at 200 kilometers helium alone is present. Vegard's work on the aurora and its spectrum has led him to conclude that nitrogen is predominant to the very top of the atmosphere. Vegard's observations of auroras, as well as Lindemann and Dobson's study of the phenomena of meteors, indicates that the density of the atmosphere above 60 kilometers must be much greater than was formerly supposed. The latter account for this density by postulating a temperature of 300° Absolute for the air between 60 and 160 kilometers, brought about by the absorption of solar radiation in the ozone layer, but Vegard finds this incapable of explaining his observations and favors the hypothesis that the nitrogen is kept up by virtue of existing in the upper strata in the form of fine solid crystalline dust which is highly positively electrified through the photoelectric action of the short wave length solar radiation.

Scientific Organization. Existing international scientific organizations were disrupted by the War. In 1919 the International Research Council was formed to effect international cooperation in scientific work. A section of the International Geodetic and Geophysical Union of this Council is devoted to meteorology. The second meeting was held at Rome in 1922.

Necrology. The following eminent meteorologists died between 1914 and 1924: Henrik Mohr, Sept. 12, 1916; Cleveland Abbe, Oct. 30, 1916; Max Margules, Oct. 4, 1920, and Julius von Hann, Oct. 1, 1921.

Bibliography. New books of importance on meteorology were: R. G. K. Lempfert, *Meteorology* (London, 1920); C. F. Talman, *Meteorology* (New York, 1922); Sir Napier Shaw, *Forecasting Weather*, 2d ed. (London, 1923); W. J. Humphreys, *Physics of the Air* (Philadelphia, 1920); F. M. Exner, *Dynamische Meteorologie* (Leipzig, 1917); L. F. Richardson, *Weather Prediction by Numerical Process* (Cambridge, 1922); J. Hann, *Lehrbuch der Meteorologie*, rev. by R. Süring, 4th ed. (Leipzig, 1923); W. J. Humphreys, *Weather Proverbs and Paradoxes* (Baltimore, 1923); W. Köppen, *Die Klimate der Erde* (Berlin and Leipzig, 1923); W. G. Kendrew, *Climates of the Continents* (Oxford, 1922); A. E. Douglass, *Climatic Cycles and Tree Growth* (Washington, 1919); *Smithsonian Meteorological Tables*, 4th ed. (Washington, 1918); J. W. Smith, *Agricultural Meteorology* (New York, 1920); J. M. Pernter and F. M. Exner, *Meteorologische Optik*, 2d ed., (Vienna and Leipzig, 1922). See PHYSICS; EARTHQUAKES; SEISMOLOGY

METEORS. See ASTRONOMY.

METHODIST EPISCOPAL CHURCH.

In 1924 there were about 15 different divisions of Methodists, aggregating about 8,000,000 members. The Methodist Episcopal Church was the largest branch. In the United States the membership increased from 3,566,542 in 1914 to 4,336,841 in 1923, the number of ministers from 17,804 to 18,706, and the number of churches from 26,296 to 26,621. The Sunday schools in 1914 numbered 26,840 with an enrollment of 3,746,521; in 1923, 26,345, with an enrollment of 4,366,529. The membership throughout the world increased during the same period from 4,161,306 to 4,952,212. Included in affiliation with the church in the United States was the

work in Denmark, Finland, Korea, China, Norway, Germany, Sweden, Switzerland, Italy, Mexico, Philippine Islands, and several countries in South America. In addition to these mission stations, there were grouped mission conferences in Austria, Bulgaria, Jugo-Slavia, Africa, Netherlands India, Porto Rico, Rhodesia, France, Russia, Alaska, Hungary, and Hawaii. Much of this work was carried on throughout the decade 1914-24 by the Board of Foreign Missions and the Women's Foreign Missionary Societies. The church had 80 hospitals, and during the year 1923 it cared for 148,000 persons. There were, in 1924, 38 homes for the aged and 45 for children. One of the great boards of the church, the Board of Pensions and Relief, had under its immediate care over 8000 retired ministers, ministers' widows, and ministers' orphans under 16 years of age. The annuity claim of this great company was about \$3,375,000 a year. The council of the boards of benevolence between 1920 and 1924 handled over \$66,000,000, which went to the home and foreign fields. In the United States there were 196 colleges, universities, and secondary schools, with over 89,000 students. Outside the United States, in the mission fields, were schools of all kinds, aggregating 3849, with 163,000 pupils. The publishing interests of the Methodist Episcopal Church were conducted by the Methodist Book Concern, which had three publishing plants, at New York, Cincinnati, and Chicago. Average sales were over \$5,000,000 a year.

After many years of effort to join the Methodist Episcopal Church and the Methodist Episcopal Church South, an agreement for union was reached and put before the General Conference of the Methodist Episcopal Church at Springfield, Mass., in 1924, which voted 802 to 15 in favor of the unification plan as agreed on by the Commission of the two churches. This led to the calling of a special session of the General Conference of the Church South, meeting July 2, 1924, at Chattanooga, Tenn.; after three days of vigorous debate, a vote taken on July 4 was 297 to 75 in favor of unification. In August, 1924, the plan had yet to go before the annual conferences of the churches of the South and North; if they gave it a two-thirds majority, unification would then be in effect; and the two General Conferences would be called to meet together.

METHODIST EPISCOPAL CHURCH, SOUTH. This branch of the denomination came into existence in 1845 through a division of the original Methodist Episcopal Church by General Conference action in 1844 when it became evident that the church could not find a policy on slavery acceptable to both sections of the country. It is the second largest branch of the church. The number of communicants increased from 1,996,877 in 1914 to 2,418,336 in 1923; the number of churches from 17,006 to 17,504; and the number of traveling preachers from 7203 to 7970. The number of Sunday-school pupils rose from 1,479,977 to 2,050,137; officers and teachers from 134,930 to 162,439; and members of the Epworth League from 133,380 to 247,552. The denomination maintained a large number of educational institutions, chiefly in the South, comprising 29 universities and colleges, 28 junior colleges, one Bible and Missionary Training School, 28 academies, and 8 mission schools. Its Board of Missions superintended missionary work in Brazil, Mexico

China, Japan, Korea, and the Congo. Through the Centenary Movement projected in 1918, \$50,000,000 was raised for missionary work, and through the Christian Education Movement, inaugurated in 1920, \$20,000,000 was raised for educational work. A plan to unite the two largest branches of American Methodism was accepted by the General Conferences of both branches. Headquarters were in Nashville, Tenn.

METHODISTS, CANADIAN. Five organizations in Canada similar in their beliefs, the Methodist Episcopal Church, the Wesleyan Methodist Church, the Primitive Methodist Church, the Methodist New Connection Church, and the Bible Christian Church, united to found the Methodist Church in Canada in 1883. Besides Canada and Newfoundland, the denomination has churches in Bermuda affiliated with it. The organization and administration of the church is effected through 12 Annual Conferences, subdivided in many districts. The membership increased from 376,761 in 1915 to 407,264 in 1923, but the number of ministers declined from 2871 to 2106, the number of Sunday schools from 3824 to 3754, and the number of pupils from 420,210 to 407,264; the number of teachers and officers increased from 41,929 to 43,334. The denomination had under its supervision 17 colleges and universities. Foreign missions were maintained in China and Japan.

METHODISTS, COLORED. The Colored Methodist Episcopal Church was organized in 1870 as a separate body under the oversight and care of the Southern Church. According to statistics published by the denomination, the membership increased from 275,000 in 1914 to 366,315 in 1922; the number of preachers in 1914 was about 3000, compared with 3039 ministers and 2590 lay preachers in 1922. The number of pupils in the Sunday schools increased from 79,876 in 1917 to nearly 193,000 in 1922, and officers and teachers increased from 7098 to 18,884; Sunday schools fell from 4007 to 2543. Churches increased from 3000 to 3824. The denomination supported nine colleges and published three periodicals.

METHODISTS, WESLEYAN. The mother church of the denomination and the principal branch in Great Britain and Ireland. It was founded in 1729, the first society was formed in 1739, and the first conference held in London in 1744. The church in 1924 was composed of five main conferences: Great Britain, Ireland, Foreign Missions, France, and South Africa. The membership figures of the denomination showed an increase from 922,796 in 1915 to 933,167 in 1923; the number of churches grew from 17,671 to 18,081, and the number of lay preachers from 30,221 to 33,549. The Sunday schools increased from 10,794 to 11,312, but the number of pupils dropped from 1,121,682 to 1,055,699, and the number of officers and teachers from 143,182 to 133,431. A publishing house was maintained in London.

Primitive Method Church. Known in England as the Camp Meeting Methodists. Church membership increased from 206,812 in 1915 to 210,923 in 1923, but the number of churches fell from 4903 to 4623, the number of ministers from 1149 to 1091, the number of lay preachers from 15,537 to 13,939, and the Sunday schools from 4204 with an enrollment of 447,050, to 4026 with an enrollment of 419,632.

United Methodist Church. Membership in this denomination rose from 185,769 in 1915 to 186,257 in 1923, the number of churches from 3013 to 3043, the number of lay preachers from 6156 to 13,939; and the ministers decreased in numbers from 848 to 745, the Sunday schools from 2286 with 294,039 pupils and 40,744 officers and teachers, to 2216 with 274,056 scholars and 38,422 officers and teachers.

Wesleyan Reform Union. This denomination remained fairly stationary during the decade. Its membership in 1915 was 8526 as compared with 8593 in 1923, the number of churches (206) was the same in both years, the ministers numbered 25 in 1914 and 24 in 1923, and the lay preachers 500 in the earlier year and 432 in the latter. The Sunday schools numbered 195 at the beginning of the decade and 196 at the close.

Independent Methodist Churches. Membership of this denomination increased from 9215 in 1915 to 9639 in 1923, while the number of churches decreased from 163 to 144 and the ministers from 411 to 374.

Australasian Methodist Church. This denomination increased in membership from 149,878 in 1915 to 160,911 in 1923, while the number of churches dropped from 5147 to 4706 and the lay preachers from 8634 to 8218.

New Zealand Methodist Church. This denomination showed a slight decline during the years between 1915 and 1923. Its membership dropped from 24,218 to 22,916, its ministers from 198 to 181, lay preachers from 928 to 774, Sunday schools from 411 to 405 and pupils from 29,917 to 29,154. The number of churches, however, rose from 459 to 825.

Japan Methodist Church. Church membership increased from 13,838 in 1915 to 22,000 in 1923, and church buildings from 245 to 337, but the number of ministers decreased from 232 to 230.

METROPOLITAN OPERA HOUSE. See *Music, Opera*.

METZLER, WILLIAM HENRY (1863-). An American mathematician, born at Odessa, Ont., and educated at Toronto and Clark Universities. From 1892 to 1894 he was instructor in mathematics at the Massachusetts Institute of Technology and then accepted a call to Syracuse, where in 1896 he became Francis H. Root professor of mathematics and head of the department. During 1911-17 he served as dean of the Graduate School and in 1921 became dean of the College of Liberal Arts. Professor Metzler's original investigations, on which he published important results, included studies on symmetric functions, vanishing aggregates, and compound determinates. He served as editor of *The Mathematics Teacher* and the *Journal of Pedagogy*.

MEXICAN BEAN BEETLE. See *ENTOMOLOGY, ECONOMIC*.

MEXICO. A republic of North America with an area of 767,168 square miles, almost equal to the combined areas of Great Britain and Ireland, France, Germany, and Austria. Its total population of 14,100,000, according to the 1921 census, is 30 per cent less than the combined populations of New York and the New England States. Mexico City is the most important centre, with a population over 900,000. It is the capital of the republic and the chief centre of manufacturing, trade, and banking interests. Other important cities are: Guadala-

jara, 149,308, a railway, manufacturing, and agricultural centre of the west coast; Puebla, 101,000; Tampico, 94,378, the most important oil centre and second port of the country; Monterey, 81,000, San Luis Potosi, 83,000; Vera Cruz, the chief port, 75,000; Merida, capital of Yucatan, 62,000; and Chihuahua, 48,310.

Industries. Mexico was known during 1914-24 principally for its enormous mineral resources, but a very noticeable movement from the rural to the urban centres was apparent, and Mexico was becoming more and more a manufacturing nation. Before the outbreak of the 1910 revolutions, Mexico was the leading industrial nation in the Western Hemisphere, south of the United States.

Petroleum. Prior to 1910, mineral oil was a very small factor in the economic life of Mexico. In that year, the total oil production was 3,634,080 barrels. By 1914 it had jumped to 26,233,403 barrels, an increase of over 700 per cent. Despite political disturbances, which damaged all other industrial enterprises, petroleum production increased steadily from 1914 to 1921, when the peak of production was reached with an output of 193,397,587 barrels, valued at \$182,936,817. Because of exhaustion of old wells and the uncertainty of property ownership, production in the next two years was less. The 1922 production was 182,278,457 barrels (\$167,307,872); 1923, 149,529,088 (\$142,916,885). Total production since 1901, when the first well was brought in, was 1,053,257,562 barrels, valued at \$828,241,710. (All conversions are made at the rate of two Mexican pesos to the dollar.) Mexico was the second largest petroleum producer in the world, standing second to the United States. In 1923, the United States produced 735,000,000 barrels; all other countries except Mexico, 116,000 barrels. Only about 15,000 acres of oil land were exploited in Mexico, while many thousands of acres more were said, on good authority, to contain oil deposits.

Mining. The mineral resources of Mexico were enormous. Except for a short time during the most disturbed period of the revolution, Mexico was the leading silver producing country in the world. The Spaniards worked the silver mines in the early part of the sixteenth century, and the natives before them. The principal minerals were silver, gold, copper, lead, iron, and zinc, although there were also deposits of coal, platinum, mercury, manganese, antimony, sulphur, bismuth, and graphite. The five most important minerals produced in Mexico were silver, gold, copper, lead, and zinc. In 1914, production in general was at an extremely low ebb. After that year there was a very noticeable revival of production; the year 1923 marked a decided increase over previous years. Production in metric tons for 1914, compared with 1922 and 1923, follows:

Mineral	1914	1922	1923
Gold	8 6	23	24
Silver	811	2,522	2 825
Copper	36,337	26,978	53,372
Lead	20,350	110,456	155,721
Zinc	4,620	6,142	18,481

Agriculture. About 5 per cent of Mexico's total area was available for agricultural purposes. Principally as the result of the applica-

tion of so-called agrarian reforms, production decreased greatly in the decade, and large quantities of food crops were imported annually into Mexico. The principal crops raised were corn, wheat, beans, sisal, and cotton. In 1914, production of food crops in Mexico was as follows. corn, 1,992,555,000 kilograms (106,203,181 pesos); wheat, 119,440,000 kilos (9,553,200 pesos); beans, 142,325,357 kilos (15,665,800 pesos). Importations during 1914 were: corn, 1,268,262 kilos (92,444 pesos); wheat, 4,222,737 kilos (30,814 pesos); beans, none. The 1922 production (last year for which official figures were available) was: corn, 1,773,905,089 kilos (104,034,305 pesos); wheat, 370,844,541 kilos (44,501,345 pesos); beans, 115,187,942 kilos (16,123,312 pesos). Imports during 1922 were: corn, 83,906,485 kilos (5,032,111 pesos); wheat, 5,912,812 kilos (548,546 pesos); beans, none. In 1923 the corn crop was exceptionally large, wheat was short, and the bean crop about the same as in 1922. Of the commercial crops, sisal and cotton were the most important. Sisal production in 1922 was 122,400,000 kilograms, and cotton, 38,644,932 kilograms. In 1923, cotton production declined to 27,029,318 kilos, while early 1923 reports indicated the estimated henequen (sisal) crop would be 156,750,000 kilos. The henequen crop for 1924 was estimated before the outbreak of the revolutionary disturbances of December, 1923, at 175,000,000 kilos. The cotton crop in 1924 was expected to be much larger than that of the past few years.

Manufacturing. Manufacturing in Mexico was limited but growing. The textile industry was, in 1924, the most important. In 1923 the Mexican textile mills consumed over 70,000,000 hales of raw cotton. On Oct. 31, 1923, the total investment in buildings and machinery alone was \$36,054,000. A total of 140 mills, of which 108 were in operation, employed 38,232 hands. The total sales effected during the six-month period, May 1 to Oct. 31, 1923, were valued at \$23,878,000. Other important manufacturing industries were boots and shoes, with an average annual production of over 700,000 pairs; lumber works; flour mills, of which there were 82 in operation in 1922, with a total capital investment of over \$6,000,000; hat factories, producing annually about 800,000 pieces; many chemical industrial establishments, producing some 25,000 tons of laundry soap, 4300 tons of candles, thousands of quarts of turpentine, varnish, etc., annually. Five cement factories had a total annual capacity of 310,000 metric tons. Various difficulties kept native production down, and large amounts had to be imported annually. Some 235 mills produced 121,000 metric tons of sugar in Mexico in 1923.

Commerce. The last year for which official figures were available was 1922. Imports then were valued at 303,808,370 pesos, and exports, including petroleum, at 865,933,272 pesos (Two pesos equal one dollar). In 1913, imports were valued at 192,292,462 pesos and exports at 300,405,552 pesos. It was significant that despite disturbed political conditions, Mexico's trade was maintained throughout the long period of revolutions. The year 1915 marked the lowest level; imports were 52,821,306 pesos and exports 251,202,988 pesos. Figures for the first six months of 1923 were: imports, 150,167,740 pesos; exports, 123,853,703, showing a distinct falling off in exports as compared with imports.

The highest trade totals were registered in 1921, when imports were 508,074,097 pesos and exports 728,227,156. It is interesting to note that in 1921, United States exports to Mexico had a value four times as great as the exports of 1910, the last normal year in Mexico. Based on United States exports to Mexico in 1910, 1921 exports of cattle were over 25 times as large; rice, 21 times as large; wheat flour, 12 times; corn, $3\frac{1}{2}$ times; cotton manufactures, 15 times; iron and steel products, $4\frac{1}{2}$ times; and meat and meat products, 4 times. Principal Mexican imports were textiles, foodstuffs, iron and steel products, and various manufactures. The leading sources of imports were the United States, Great Britain, France, and Germany. Principal exports were crude petroleum, raw minerals, henequen (sisal), coffee, vanilla, and cotton. The chief countries of destination were the United States, France, Great Britain, and Germany. In 1913, Mexican imports were divided as follows: the United States, 50 per cent; Germany, 13 per cent; Great Britain, 14 per cent; France, 9 per cent; all others, 14 per cent. In 1921, these percentages were: the United States, 67 per cent; Germany, 5 per cent, Great Britain, 9 per cent; France, 9 per cent; all others, 10 per cent. For the first half of 1923, Mexico's imports were divided as follows: the United States, 68 per cent; Germany, 11 per cent; Great Britain, 8 per cent; France, 4 per cent; all others, 9 per cent.

Pastoral Activities. In 1923, the live stock census taken by the government showed a general decrease of approximately 60 per cent in all live stock as compared with 1902, the year in which the last previous census had been taken. Restocking of Mexico's once famous ranges proceeded to only a limited extent, largely because of the uncertainty of land tenure after 1917, and partly because of the lack of capital.

Communications. The period 1914-24 was marked by serious damage to all rolling stock in Mexico, the latest revolutionary movement, that of December, 1923, to May, 1924, adding to the general disruption owing to the fact that about half of the railroads in the country were in the hands of the revolutionaries. Beginning with the creation of the National Railways of Mexico in 1907, by which means the Mexican government acquired 55 per cent of the stock of many of the most important lines, government control was gradually extended until at one time practically all important lines in Mexico were merged into one system, controlled and operated by the government. Following that day, rumors were recurrent that the National Railways were to be returned to their former owners, but denials were always made. On Mar. 10, 1924, an official report gave the ownership of Mexican railroads as follows:

National Railways (majority stock controlled by government,	13,205 495 kilometers
Government owned railways	516 765 "
Private railways	7,529.195 "
<hr/>	
Total kilometers in operation	21,251.455
Total in miles	13 282

One of the most important single companies listed under "private corporations" was the Mexican Railway, a British corporation, which

ran its main line from Vera Cruz to Mexico City, with a total mileage of 474 miles. This line was taken over in 1916, merged with the National system, and returned in 1920. There were 24 important shipping companies whose boats made regular stops at Mexican ports. Four of these companies were American, operating 19 vessels calling at Mexican ports; 1 Spanish, with 5 vessels; 2 Dutch, with 9 ships; 1 Italian, with 4 vessels; 2 Norwegian, 5 vessels; 2 English, 3 vessels; 2 Mexican, 17 vessels, 3 German, 6 vessels; 2 Czecho-Slovak; 1 Japanese, 9 vessels; 1 French, with 15 vessels; and 1 Argentine company, with 3 vessels. The principal ports were, on the Gulf, Vera Cruz, Tampico, Puerto Mexico, Progreso; on the Pacific, Mazatlan, Salina Cruz, Manzanillo, and Acapulco. Serious port strikes and revolutionary disturbances at Vera Cruz damaged the port's business greatly, particularly during 1923, and its eminence as the leading port of Mexico was from then on seriously menaced by Tampico. During 1923, the Mexican government proclaimed Puerto Mexico and Salina Cruz on the Isthmus of Tehuantepec, and Guaymas on the Pacific, free ports. Formal opening was delayed by the revolutionary outbreak of 1923-24. There were in Mexico 55,786 miles of government-controlled telegraph wires, operating 567 offices, and 17,667 miles of privately owned wire, with 825 offices. There were, too, 27 government wireless stations despatching 153,386 radiograms in 1921. The government also controlled 1181 miles of telephone wire, served by 9 offices; while private companies controlled 51,461 miles of telephone wire and 862 offices. In 1922, 82,982 telephones were in service.

Finance. Compared with 1911, government revenues in Mexico increased over 160 per cent, but expenses mounted in proportion. While the financial statements of the last two or three years of the period showed a favorable balance, no mention was made in these statements of unpaid current obligations and the many claims arising from losses suffered during the long years of revolutions and from current confiscations of lands under the various state agrarian laws. In the 1922 and 1923 statements, no provision was made for a sinking fund to meet either interest or principal of any of these numerous obligations. In 1911, total government receipts were 111,142,401 pesos and expenditures 100,913,923; in 1922 receipts were 277,567,019 pesos and expenditures 267,137,468. It is of importance to note that the 1911 financial statement provided for an expenditure of almost 29,000,000 pesos for the public debt, an item which was entirely omitted in the 1922 balance sheet. The 1911 statement showed expenditures of 20,434,155 pesos for the War Department, and this had jumped to 111,021,291 pesos by 1922, not counting an expenditure of 12,917,432 pesos for the army uniform factory.

All sorts of taxation were greatly increased, and the year 1924 was ushered in with a general income tax and an increase in practically all other Federal taxes, as the financial situation of the government was admittedly very serious. Various schemes for floating a loan in the United States were reported from time to time, but none materialized. Very important steps were taken in the last few years in Mexico towards a complete financial rehabilitation, and if political disturbances should cease Mexico

would soon be once more among the favored nations financially. One of these innovations was the de la Huerta-Lamont agreement, commonly called the Bankers' Agreement of 1922, which provided a plan for the refunding of Mexico's foreign debt. Under the terms of this agreement, 30,000,000 pesos were paid by the Mexican government to the Bankers' Committee in New York during 1923, and provisions were made for an increase of an additional 5,000,000 pesos yearly until, by the fifth year, 50,000,000 would be paid. Despite the very serious financial embarrassment of the Mexican government during the last months of 1923 and the opening months of 1924, the payments falling due in 1923 (30,000,000 pesos), as well as the first payments corresponding to 1924, were faithfully made. Another important step in the financial history of Mexico was the adoption of a budget system in 1922. Under that budget, revenues for 1923 were estimated at 278,000,000 pesos, and expenses at 297,000,000. Although no official figures were available, decreased petroleum production and consequent loss of revenue, plus the losses due to the closing of Vera Cruz and other sources of customs revenues, decreased the 1923 figures far below original estimates. It seemed likely therefore that despite the fact that many of the budgeted expenditures were contingent on funds being available, the years 1923 and 1924 would show considerable deficits.

The need of a circulating medium other than metallic currency was recognized in Mexico, but the abuses of overinflated paper currency, particularly during the years 1914-17, created a very strong feeling against that sort of circulating medium, and all paper money was excluded by law. Business was cramped in consequence. To remedy this situation, a sole bank of issue was projected, the opening of which was rumored and prophesied on many occasions. Important details of capitalization, and especially the question of control which the Mexican government wanted held in Mexico, had, to 1924, delayed formal plans. The banking crisis of 1922, when the important Banque Française du Mexique failed, drawing a number of smaller banks into bankruptcy with it, passed without the further serious economic disturbances which had at first been feared. Economic stringency limited practically all banking operations, and credit continued to be very restricted, and money tight. Compiled statements on the condition of Mexican banks on Oct. 31, 1923, showed the commercial banks with a total of 27,441,664 pesos cash on hand and total deposits of 85,104,510 pesos, while the banks of issue showed 14,045,720 pesos cash on hand and 35,586,575 pesos deposits, making a total of 41,487,393 pesos cash on hand and 120,691,085 pesos total deposits. The cash on hand was divided as follows: gold, 32,209,041 pesos; silver, 3,100,103 pesos; fractional silver currency, 5,834,577 pesos; and United States currency, 655,077 pesos. Mexico City predominated in commercial banking business, with more than 75 per cent of the deposits and an equal percentage of the total cash on hand.

Education. The school system in Mexico was largely under government control. From 1896, earnest attempts were repeatedly made to better the general standard; lack of funds and disturbed political conditions interfered seriously with projected improvements from 1910. Nevertheless, in 1922, the school budget amounted to

45,000,000 pesos as compared with 2,000,000 pesos in 1920 and 9,000,000 pesos in 1921. In 1907 there were 11,940 elementary schools supported by the national, state, or municipal governments, with 776,622 pupils, and 2499 private schools with 152,917 pupils. In 1922 these numbers were as follows: government primary schools, 8388, private, 1327 schools; 711,592 pupils in government schools; 108,183 pupils in private schools. The total number of teachers in 1922 was 20,407 in all primary schools. The highest per capita school attendance outside of the Federal District, which includes Mexico City, was registered in the extreme northern state of Sonora, and this was followed by Lower California, Coahuila, and Quintana Roo, in the order named. The lowest percentage of attendance per capita was in the State of Oaxaca. The Constitution of 1917 made school attendance compulsory for all children under 15 years of age. This same document forbade the establishment or direction of primary schools by religious bodies of any denomination, but there remained a comparatively large number of such schools established throughout the country. In recent years States passed individual laws aimed at religious schools, but these were not rigidly enforced. In 1916 it was officially stated that 80 per cent of the population in Mexico was illiterate. Determined efforts on the part of interested educators of note, chief among whom stood José Vasconcelos, resulted in reducing this high percentage by 1924 to about 65 per cent. Great strides were being made in Mexico toward a better and more general and accessible system of education, and the programme for the first half of 1924 called for the formal opening of the Benito Juárez Educational centre, in Mexico City, to accommodate 4000 children of both sexes, and equipped with library, swimming pool, etc. The Gabriela Mistral, in another section of Mexico City, was also to receive 4000 students, boys and girls, as well as some older students. A national stadium and a Hispano-American Flag Room and library were also to be opened, while on May 15, 1924, on the outskirts of Mexico City, the José María Morelos school was to begin functioning by receiving 5000 students. In May, 1924, it was planned to inaugurate the Technological Institute in Mexico City. In 1910, the National University in Mexico City was refounded, and in 1924 it possessed an enrollment of over 7000 students. A number of special schools were also maintained by the government; chief among them were schools of law and medicine, agriculture, engineering, mining, commerce, and fine arts. Over 150 libraries and 34 museums were established throughout the country in the larger cities. The National Library alone, in Mexico City, contained over 200,000 volumes.

HISTORY

From the accession of Gen. Victoriano Huerta as provisional president on Feb. 18, 1913, until the defeat and flight of Adolfo de la Huerta in 1924, Mexico passed through a series of revolutions, civil wars, and attempted revolutions, in all of which foreign economic interests, and especially the interests of the United States, were so significantly involved as to rival if not overshadow in importance the domestic agrarian, religious, and constitutional issues which were at stake. The Huerta government was from

the outset in ill favor with the Washington administration, partly because Huerta was considered to have been responsible for the killing of the deposed president, Madero, on Feb 23, 1913, partly because President Wilson believed Huerta's rule to be an obnoxious "military despotism", and partly, as the letters of Walter Hines Page disclose, because a strong suspicion prevailed at Washington that Huerta was merely the tool of Lord Cowdray, the British oil magnate. By refusing to recognize Huerta, President Wilson had made it almost impossible for the provisional government to borrow money. By lifting the embargo on arms, on Feb 3, 1914, a step which played directly into Huerta's enemies' hands, for they controlled the North and alone could purchase munitions in the United States, the American government afforded valuable assistance to the rebels. It is doubtful whether the ensuing struggle between Huerta's Federalist forces and Carranza's Constitutionalists was plainly between despotism and democracy. The rebels were not exactly the whole-hearted defenders of peasant rights, for Carranza was himself one of the largest land-owners, while Huerta during his short term had already moved to alleviate agrarian distresses; the rebels made no secret of their enmity toward the Roman Catholic church and openly persecuted the clergy; the meddling of foreign interests whose great property rights made Mexico a peculiar concern was not to be overlooked, the ambitions of military leaders, the desire for plunder and power, were undoubtedly potent factors. In short, the conflict was due to a complexity of interacting causes. President Wilson's "watchful waiting" policy materially influenced the outcome. Huerta was soon beset by enemies. To the north he was pressed by Villa, Angeles, and Gonzalez; to the west by Buelna, Cabrera, and Obregon; to the south by Zapata and Alvarado. One after another of his ministers deserted him, Rojas, Lozano, Tamarez, and Moheno (May-July, 1914). The *coup de grâce* was struck when American suspicious aloofness turned into direct interference. The arrest of American marines bound on a peaceful errand at Tampico on April 9 was immediately apologized for, but Admiral Mayo's insistence that a salute be rendered to the flag, in which he was reluctantly supported by Wilson, and Huerta's refusal unless the Mexican flag be similarly saluted, were the factors leading to the break. On April 21 American marines landed at Vera Cruz for the purpose of seizing the custom house. But firing from the houses made it necessary to clear the streets and take over the terminals and cable and telegraph offices. In the fighting 18 marines were killed and 70 wounded. The storm of resentment was universal in Mexico. Carranza might have joined Huerta in defying the United States had it not been for the cooler counsels of Villa. Thus isolated, Huerta was compelled to accept the proffer of mediation tendered by the A. B. C. Powers, i.e. Argentina, Brazil, Chile. Mediators met at Niagara Falls on May 20, but no solution presented itself that was at once acceptable to the Huertistas, the Carranzistas, and the Americans. Carranza's generals, in a conference at Torreon in July, 1914, expressed themselves as unequivocally opposed to any treatment with Huerta short of unconditional surrender. The result was a decision to continue the fighting. This turn of

affairs hastened Huerta's fall; he resigned on July 15. His successor, Francisco Carbajal, remained in office less than a month. The Constitutionalists now hastened their advance. San Luis Potosí fell on July 17, Guaymas on July 18, Manzanillo on July 24, Guanajuato on July 28; Pachuca, Toluca and Morelia, August 9-10. On August 13 a protocol was signed arranging for the peaceful capitulation of Mexico City. On August 15, General Obregon rode into the capital at the head of 15,000 men. On August 20 Carranza made his triumphal entry.

Carranza's accession failed to inaugurate the peaceful reign of democracy. In September the bandit Zapata, erstwhile Constitutionalist, resumed his lawless activities on the refusal of Carranza to accept his agrarian reforms. Another revolt was the work of Gen. P. Orozco in the neighborhood of Aguascalientes. Late in August a counterrevolutionary movement was inaugurated near Puebla by 20,000 former Federal soldiers under the leadership of Generals Almazan, Aguilar, and Argumedo. Villa, however, was the most formidable enemy of the new government. On September 23 he declared war on Carranza, and with no decisive results hostilities dragged on. A convention of military delegates called by Carranza in October in Mexico City moved to Aguascalientes where it was dominated by Zapatistas and Villistas. On October 30, the convention decreed the retirement of both Carranza and Villa and on November 2 elected Gen. E. Gutierrez provisional president. Carranza refused to heed the decree of the convention, and, establishing himself at Puebla, prepared for trouble. On November 24 the Carranzista forces were withdrawn from Mexico City, leaving the capital a prey to the Zapatista bandits, who were at once joined by Villa. Meanwhile the Americans had evacuated Vera Cruz and possession was taken by Carranza. Amid the conflicts between the rival factions the state of the civilian population was anything but happy. From the provinces came reports of churches desecrated, of violence done to priests and nuns, of towns and estates plundered. The lot of the clergy was particularly unfortunate and elicited the commiseration of Pope Benedict XV on Oct. 25, 1914.

The history of the next two years is the story of the varying fortunes of Villa and Carranza, of Constitutionalists and "Conventionists". A third party, for a brief time, was injected into the squabble, when Gutierrez, who had been unseated on Jan 17, 1915, gathered a force and established headquarters at Pachuca. On January 26, having been defeated in skirmishes about the city, Villa evacuated Mexico City and retreated northward. In February he encountered the forces of Gutierrez and Carranza in separate battles of San Luis Potosí and won decisive victories. On February 13 he captured Guadalajara, but early in March "Conventionists" retook Mexico City. Thence on, his star declined. In three disastrous attempts to capture Celaya from General Obregon, Villa lost in killed and wounded more than 20,000 men. In May he had to give up Monterey and suffer defeat at Paredon and Trinidad Station. In all these forays Mexico City was always the focal point. During 1915, Constitutionalists and Conventionists each held the city for three periods, to the infinite harm of the population, native and foreign. Levies were imposed on foreigners,

and shops were pillaged; rioting became a commonplace. By June the city was almost completely isolated, and the dearth of food presented a very real danger. This, and the continued protests of foreign nations against the destruction of lives and property, once more brought the United States on the scene. On June 2, President Wilson issued a declaration of policy which held out the promise of aid to any party capable of winning a decisive victory. This served as a spur to renewed activity. Mexico City was taken, lost, and taken again in the month of July by Constitutionalists under Gonzales. Meanwhile the United States had invited the ambassadors and ministers at Washington of Argentina, Brazil, Chile, Bolivia, Guatemala, and Uruguay to a conference for the consideration of Mexican affairs. The conference assembled in August, and in an appeal dated August 11 it called on the warring factions to get together for an amicable discussion of their differences and the best interest of their country. Villa consented; Carranza refused on the ground that he could not tolerate "that the interior affairs of the republic be handled by mediation or by the initiative of any foreign government." Regardless of this check, the conference met once more in New York City on September 18 and decided that recognition would be accorded that group which could give evidence of possessing "material and moral capacity necessary to protect the lives and property of natives and foreigners." Three weeks later the conference accorded *de facto* recognition to Carranza. With the other nations, Colombia and Nicaragua joined a little later. Immediately after, 200 of Zapata's officers laid down their arms, and Gutiérrez likewise surrendered. Villa alone remained. His next move was startling and could be interpreted only as the result of a desire to force American intervention. On Jan. 11, 1916, a band of Villistas stopped a train near Santa Ysabel, removed a party of 19 engineers on their way to open a group of mines, and in cold blood killed all but one.

Indignation in the United States reached fever heat. Resolutions were immediately introduced in Congress demanding intervention; the President's "watchful waiting" policy was strongly attacked. Only calmer counsels prevented the passage of the resolutions and the forcing of the President's hand. Information divulged by Secretary Lansing indicated how precarious was the position of Americans in Mexico and on the border. Figures showed that 76 Americans had been killed in the three years preceding Jan. 1, 1916. Of these, 24 had been killed from causes arising directly out of revolution; 44 by bandits, Indians, and civilians; and 8 in a railroad accident which was a result of the disorders. Between 1913 and 1915, 20 American civilians, 16 American soldiers, and 62 Mexicans were killed on the American side of the border. Two months later the events occurred which led the United States to intervene directly. On March 9, the border town of Columbus, N. M., was suddenly raided at night by some 1500 Villistas, and 11 civilians and 9 troopers were killed. With the almost unanimous consent of Congress, the President despatched a punitive expedition under General Pershing across the border in hot pursuit of Villa. Carranza's conduct throughout the preceding discussions had been extremely ungracious. Conditions laid down by

him, though onerous, were accepted; the pursuing forces were not to cross the line within six miles of any town on the border or to occupy any city or town; railroads could be used only in case trains were not guarded. From Casas Grandes three divisions of troops radiated in different directions. Near Guerrero a clash took place which resulted in the rout of Villa and his men. The most important conflict, during the chase, ironically enough, took place between Americans and official Mexican troops. On April 12, a detachment of cavalry, about to encamp outside the city of Parral, was suddenly attacked in the rear and both flanks and compelled to retire to a nearby village for shelter. Only the arrival of reinforcements at nightfall prevented the occurrence of what might well have been a tragedy. Villa, however, was not heard from, though the American occupation continued. In May, Generals Scott and Funston met with Generals Obregon and Trevino, but without result. On May 22, Carranza, in a long note in which he questioned the sincerity of American purposes, demanded the immediate withdrawal of the American troops. The American reply was the sending of all available regulars to the border and the calling out of the militia of Texas, Arizona, and New Mexico. On June 18 the entire organized militia and national guard of all the other states were called into the service. By July 31, 112,000 militia troops were transported to the border. Border raids continued from time to time, and small detachments occasionally crossed the boundary line in pursuit. On June 20, Secretary Lansing replied to Carranza and bluntly refused the withdrawal of the American troops. On the same day American troops were attacked at Carrizal by Mexicans and after a hot fight were compelled to retreat. The Americans killed and wounded numbered 16, the captured, 24. A few days later the prisoners were released. During the following month the American troops gradually withdrew northward. On July 4, in a note to the State Department, Carranza suggested mediation on the part of Latin-American countries as a way out of the difficulties. From Sept. 15, 1916, to Jan. 15, 1917, a commission assembled in the United States; but it was made up of only American and Mexican delegates. While the commissioners sat, civil war again broke out. In October and November, 1916, Villistas were active in the neighborhood of Chihuahua. During the prolonged sittings of the commission it became evident that the only real question under discussion was the right of the United States to send punitive expeditions into Mexico. On November 24 a protocol was signed by all the delegates which called for American withdrawal in 40 days, though the United States reserved the right to pursue bandits who had invaded American territory. It was not clear in 1917 just what had been accomplished. Mexico refused to accept the protocol: the problem of guarding the American border was left unsolved; and those larger questions of international relations which had been the peculiar concern of President Wilson were not touched on. On Feb. 5, 1917, the withdrawal of troops from Mexico was complete, and the militia on the frontier was rapidly being reduced about the same time that Henry P. Fletcher, American ambassador, left for Mexico.

On Oct. 22, 1916, delegates had been elected

to a Constitutional Assembly This body, representing only adherents of a *de facto* government, met at Sueretaro on December 1, and by Jan 31, 1917, it had completed a new fundamental law The document contained many advanced provisions; the presidency could be held for only a single term, suffrage was to be universal without distinction of sex, a radical labor code provided for an eight-hour day, the minimum wage, compulsory profit sharing, and a free employment bureau; the religious orders were expropriated, their churches, schools and hospitals confiscated, and the schools secularized. The most famous provision, Article 27, restored communal lands to Indian villages; authorized each state or territory to fix the maximum area which any person might own and to subdivide excess holdings; deprived religious organizations of the right to own land, and, probably most important of all, declared ownership of all minerals and petroleum resources to be vested "in the nation" Only Mexicans by birth or naturalization were to have the right to acquire ownership of lands or to obtain mineral and oil concessions; foreigners could receive such rights only by agreeing to renounce their rights of appeal to their home governments. On Mar 11, 1917, Carranza was elected president. Most of the events of the next three years hinged on Article 27. It had been incorporated in the constitution against Carranza's wishes and as a result of the agitation of the more radical followers of Obregon Immediately on its promulgation, state after state formed agrarian commissions which proceeded to confiscate and redistribute the land in the interest of the Indian peons. Carranza, in order to check these local commissions, found it necessary to appoint a National Agrarian Commission for the administration of the matter on a more scientific basis. It thus became evident that something like an agrarian revolution had been started International complications soon arose to thwart this attempt at putting the Mexican house in order The nationalization of the subsoil struck at the foreign ownership of the very rich oil fields in Mexico. On Feb 19, 1918, the Mexican government proceeded to inaugurate this policy by imposing area taxes and ground taxes on foreign concessions. Other decrees of a similar purport followed during the year Protest, of course, was inevitable, and, as events proved, unavailing On April 2, Mr Fletcher, on behalf of the American government, filed a note declaring that "the seizure of property at the will of the sovereign without legal process equitably administered and without provision for just compensation has always been regarded as a denial of justice and a cause for diplomatic representation" The refusal of foreign operators to conform with the governmental decree was followed by a refusal to issue drill permits. The lower Mexican courts upheld the government; not until much later was the air cleared. Appeal taken to the Supreme Court finally brought in 1922 the decision that while under Article 27 the right of ownership by the state to all subsoil resources could not be questioned, nevertheless all individuals and companies who had purchased properties for the express purpose of exploiting their mineral and oil deposits were to be protected in their private rights. The retroactive character of the article was therefore disclaimed. On this basis, drilling

permits were once more issued in 1922, and partial operations were inaugurated after a four-year cessation of activities

The ensuing years of Carranza's administration could hardly be characterized as fulfilling the high democratic hopes entertained for the Constitutionalist movement. Peace, of course, Mexico never enjoyed Banditry continued to operate in defiance of the Mexican soldiery, though possibly with their connivance, too. In reprisal for Mexican outrages, American border troops often found it necessary to cross the frontier in pursuit of raiders. During 1919 alone, more than 300 serious outbreaks were reported to the Senate Committee on Foreign Relations. A particularly flagrant act was the capture and holding for ransom of William Jenkins, a United States consular agent, on October 19. Despite the strong protests of the State Department, the Mexican government refused to release Jenkins on the ground that he was implicated in his own abduction On December 4, however, he was suddenly set free While commerce increased under Carranza and taxes were being collected more widely than before, anarchy in government was conspicuous. Official corruption flourished; dissension among the leaders added to the prevailing unrest, the constitution, with its radical pretensions, was flagrantly disregarded How unstable affairs were, the events of 1920 indicated. As the presidential election campaign progressed through 1919 and 1920 it became evident that Obregon, with the support of the army, the radicals, and the foreign interests, was going to win over Carranza's nominee. Carranza's action was typical Obregon was summoned to Mexico City under arrest. Meanwhile the state of Sonora had broken out into open revolt because of Carranza's attempt to control it. By the end of April the West and North were under arms. In the interim Obregon had made his way safely from Mexico City to the insurgents' camp and was in the field. On April 23, the revolutionists proclaimed a new provisional government with Adolfo de la Huerta as president. On May 7, after the city of Vera Cruz had capitulated to the insurgents, Carranza fled from the capital and made for the seacoast, ostensibly to escape the country. His flight was impeded at almost every step. On May 21, after having surrendered himself to the troops of General Herrera, he was treacherously shot and killed while asleep in a hut near the village of Tlaxcalantongo in Puebla.

On May 24, 1920, the Mexican Congress chose Adolfo de la Huerta as provisional president; in the September election Obregon was victorious, meeting with only a nominal opposition. He was inaugurated on Dec 1. Obregon's administration was marked by steady progress His sympathies with labor and the agrarian elements were indicated in legislation designed to further their prosperity through the enforcement of the labor code and the agrarian articles of the constitution The restoration of lands formerly held by villages and tribes, which had been expropriated by individuals, steadily proceeded, and so did the partitioning of the great estates. During the first half of 1923 alone, over 600,000 acres were restored and 1,500,000 acres turned over to peasants by the Mexican Agrarian Commission. Federal lands, including water rights, were thrown open to homesteaders. No attempt was made to inter-

fere with the Socialist régime of Governor Corrallo in Yucatan. From 1921, the rehabilitation of the railways made a continuous advance, even building was undertaken on a large scale. The army was reduced to 50,000 men, and the pay of the official bureaucracy was cut. A consistently friendly attitude was displayed toward foreign nations and their nationals. On July 13, 1921, President Obregon invited all interested countries to send representatives to constitute a permanent Mexican claims commission. In November, France, Great Britain, Italy, Spain, and the Netherlands accepted. Steps were taken to clear up the tangle of the national debt. In September, 1921, Thomas W. Lamont of J. P. Morgan and Company arrived in Mexico for the purpose of effecting arrangements for the funding of the bonds held by Americans, British, French, Dutch, and Belgians. The accrued interest on Mexican external bonds now amounted to some \$200,000,000. In September, 1922, an agreement was reached with the international bankers by which the Mexican government pledged itself to set aside annually for the service of the debt the entire proceeds of the oil export tax, 10 per cent of the gross revenues of the national railways, and all the net operating revenues of these railways. Late in 1922 the first interest payment on the bonded indebtedness was deposited in New York. Nothing exhibited better the honest purposes of the administration than the attitude adopted toward Article 27. In spite of an active interventionist propaganda carried on in the United States by oil interests, to which Senators King and Fall lent their influence, Obregon refused to be turned from his course. He declined to formulate a treaty with the United States, based on the recognition of American property rights, before his own government was recognized. In 1922 he signed a decree declaring that Article 27, in accordance with the decision of the Mexican Supreme Court, was not retroactive; but further concessions he would not make. The responsibility for nonrecognition now shifted to the United States, for Mexico had met all foreign demands relative to the external debt, the outstanding claims, and the retroactive character of the offensive constitutional article. The United States delayed until the spring of 1923, when two American commissioners were despatched to Mexico City to treat with the government. During the course of the ensuing negotiations, the Mexican government evinced a conciliatory disposition by enacting a new petroleum law on April 26; it confirmed the validity of concessions obtained before May 1, 1917, but required concessionaires to revalidate their claims within three years. Likewise, Obregon endeavored to facilitate a settlement of the land problem by increasing the size of estates permitted to individual owners and by granting immunity from expropriation to large irrigation companies having colonization contracts with the federal government. A provision for indemnification, in public bonds, of landowners who had suffered from confiscatory measures between 1913 and 1917, failed to satisfy the American commissioners, who demanded payment in money. Not until August 15 was a final agreement reached. In regard to oil and minerals, the subsoil rights acquired and exploited by American companies before May 1, 1917, were validated, but the provisions of the constitution were to be applied after that date.

The same understanding was applied to agrarian lands so that all titles acquired after 1917 were subject to the agrarian reform laws. To this agreement were appended conventions calling for the creation of two mixed claims commissions, one for the settlement of American claims arising from disorders of the revolutionary period, the other to deal with all other claims of nationals of either country against the other. In accordance with this agreement, the United States formally recognized the Obregon government on Aug. 31, 1923. France quickly followed suit, but the British foreign office continued to withhold recognition, perhaps because of uncertainty regarding the security of British oil interests. On its part, the Mexican government carried out the agreement in regard to oil rights by a decree dated Nov. 10, 1923; subsoil rights acquired and exercised, or about to be exercised, prior to the promulgation of the constitution in 1917, were respected, but henceforth in all titles to land included in the national domain, the nation's ownership of subsoil resources was to be expressly reserved. The land agreement did not prevent energetic continuation of Obregon's programme of land reforms. On the contrary, almost 300,000 hectares were distributed between August 4 and November 20, under a decree permitting landless citizens to claim homesteads on public land.

The agreement with the United States was undoubtedly the outstanding event of the year 1923, but notable also were the adoption of a budget allotting \$15,000,000 for payment on the international debt account, the assassination of the once prominent revolutionary leader Francisco Villa on July 20, the expulsion of the papal representative, Mgr. Filippi, and the beginning of a momentous electoral campaign. The two last-mentioned occurrences require further notice. Mgr. Filippi incurred the displeasure of the government by participating in an open-air religious ceremony to celebrate the laying of the cornerstone of a shrine in defiance of the orders of the governor of the state (Guanajuato). The Federal government promptly supported the governor in his prohibition of Catholic ceremonies out-of-doors, and Mgr. Filippi was compelled to leave Mexico at once. This episode evoked protests not only from the Vatican but from numerous Catholic organizations in Mexico itself and in other countries, but it was only one of numerous anti-clerical measures. The law passed by the Durango state legislature later in the same year, limiting to 25 the number of clergy for each religious denomination in the state, which at that time had over 200 priests, was a typical manifestation of the anti-Catholic feeling prevalent among many of the local politicians. Such interferences with religious liberty alienated many of Obregon's supporters and were in some measure responsible for the organization of a counter-movement, modeled on the plan of the Italian Fascisti (q.v.), to defend, among other things, the interests of the Catholic Church.

The presidential campaign, in anticipation of the elections scheduled for July 6, 1924, was begun quite early in 1923 and soon overshadowed all other interests. President Obregon himself was debarred from becoming a candidate for reelection under the terms of the constitution of 1917, but two members of his cabinet appeared as candidates for nomination by the government

party, the Cooperatistas. General Plutarco Calles, resigning his post as minister of the interior, appeared first in the field, in September, and anticipated an easy victory as President Obregon's personal choice. But a majority of the Cooperatista party, it developed, preferred the finance minister, Adolfo de la Huerta, who had played a conspicuous rôle in the recent negotiations with the United States. After seemingly hesitation, de la Huerta yielded to the promptings of his friends, resigned from the ministry, and in October entered the lists against Calles. President Obregon now hastened to support his protégé Calles. Through a new finance minister, Alberto Pani, Obregon accused de la Huerta of gross extravagance and responsibility for Mexico's virtually bankrupt condition. Nevertheless, the Cooperatista party, assembling in convention at Mexico City, defiantly nominated de la Huerta as its candidate, and the latter promised to stand on the Cooperatista platform of promoting coöperative enterprises, indemnification of landowners for estates divided among the peasants, and protection of municipal home rule. The Social Reform party, the National Independent party, and several other organizations likewise rallied to de la Huerta's standard, in support of what might be called liberal conservatism, i.e. agrarian reform of a moderate type. General Calles, on the other hand, was nominated by the National Agrarian party, and pledged himself not only to maintain the constitution but also to carry out the agrarian reform in a thoroughgoing fashion and to champion the interests of the workmen. A minor candidate was General Flores, nominated by the Reformed Revolutionary party. Meanwhile excitement had been raised to an extraordinary height by various provincial elections, important because each faction was eager to control the local governmental machinery and thus to secure victory in the coming national contest. In several of these local contests blood was shed. Claiming that the Federal administration was interfering in the state elections and violating state sovereignty, the de la Huerta faction resorted to desperate measures. On Dec. 5, 1923, they issued the Plan de Vera Cruz, a plan for a new insurrection, and at once the military forces in the states of Vera Cruz, Chihuahua, Michoacan, Tamaulipas, and San Luis Potosí accepted the call to rebellion. Once more the country fell a prey to civil war, with all its accompaniments of banditry, confiscation, and "executions." The rebels soon gained other states, Yucatan, Oaxaca, Guerrero, Guanajuato, Jalisco, Colima. Their armies moved against the capital. In the provinces the movement clearly revealed its conservative character; its energy was directed hardly less against "reds" and labor unions than against the Obregon government. Ostensibly, however, the aims of the rebels were declared by de la Huerta to be the respect of life and property, legislation regarding the rights of labor and capital, indemnification for expropriated landowners, respect of elections, abolition of the death penalty, woman suffrage, and educational reform. Other reasons for the rebellion were later divulged, or alleged, by President Obregon. Officials of the Aguila Oil Company, it was charged, had aided the de la Huerta forces, although on the other hand Doheny, American oil operator, admitted lending the Obregon government \$5,000,000 to suppress the rising; there

was some ground for suspecting, therefore, that this new civil war, like some of its predecessors, was at least tainted with oil. Yet another cause of the break between Obregon and his former lieutenant was disclosed by the president; during the Lamont negotiations of 1922 de la Huerta had obtained Obregon's consent to an otherwise unacceptable debt settlement by telegraphing to him the news, subsequently revealed to be untrue, that Lamont had guaranteed the basis of a new bank to aid in the financial reconstruction of Mexico. Without this bank, the debt settlement had proved unduly burdensome. In the light of this charge, it is almost paradoxical that the United States Government should have favored Obregon against de la Huerta; yet such was the case. The United States Government sold arms to Obregon, refused arms to the rebels, and threatened a naval demonstration against the latter in January, 1924. Thanks in part to the benevolence of Washington and also to the loyalty of large elements in the Mexican population, notably of organized labor, Obregon emerged victorious. Although several notable successes were achieved by the Huertista forces under their able commander, General Estrada, in December, 1923, the tide soon turned. The Federal forces recaptured the important railway centre of Puebla on Dec. 22 and began to press back the lines which had been closing in on the capital. Throughout January, 1924, the opposing armies were deadlocked. Early in February Obregon's troops took the seaports of Vera Cruz and Tuxpam, soon afterward Guadalajara fell; the states of Michoacan, Guanajuato, Jalisco, and Colima were reclaimed; several of the insurgent armies were dispersed, and their commanders captured or put to flight. By the end of March the rebels had lost all except portions of Yucatan, Campeche, Tabasco, and Chiapas, and the outcome had become sufficiently clear to warrant Charles B. Warren in presenting his credentials on March 31 as ambassador from the United States. In April, Yucatan and Chiapas were cleared of rebels. De la Huerta himself fled from Mexico. Rounding up the remnants of the once imposing Huertista army was a slow process, but it had been virtually completed by the date set for the presidential elections, July 6.

With de la Huerta eliminated, General Calles was able to enter the elections without formidable opposition. Calles himself had suspended his political campaign to serve in Obregon's army against the insurgents and resumed his candidacy only in the last week of March, after the danger had been averted. More distinctly than ever he was now stamped as the approved candidate of the Obregon government; and more than ever, in view of the Huertistas' attacks on labor radicalism, he was supported by the working classes as well as by peons hungry for land and by middle-class liberals. He openly endorsed the radical land-reform policy of Emiliano Zapata, thus winning favor with the peasantry. He voiced a wish that wages in Mexico might be as high as in the United States, a wish that was not less effective politically because it was utopian. Yet he took pains to dissociate himself from Bolshevism or "red" Socialism. His opponent, General Flores, stood on a platform of "progress, order, and honesty," and was generally supposed to enjoy the support of conservative business and landed interests, the moderate wing of the working class,

the moderates, and Catholics of clerical tendency. The election was held on July 6 in what for Mexico may be considered an exceptionally peaceful manner. Official returns came in so slowly that the definitive announcement of the result was not expected before autumn; Calles, however, was generally believed to have been the victor.

One unfortunate aftermath of the Huerta rebellion was the failure of the Mexican Government to meet the payments due on June 30 under the Lamont-de la Huerta agreement. Not only had the civil war made heavy drains on the treasury, but, President Obregon explained, he had been unable to obtain a foreign loan; moreover, the obligations incurred by the agreement were accepted on the basis of de la Huerta's false statement that he had obtained the promise of a loan for irrigation works and for the establishment of a central bank of issue. Failing this loan, it had been impossible, even by the most drastic economies and sacrifices, to fulfill the bargain of 1922.

MEXICO, CULTURE OF. See ETHNOGRAPHY.

MEYER, ADOLF (1866-). A Swiss neurologist, born near Zurich. He studied at many universities in Europe and in 1892 came to the United States, where he was on the staff of the University of Chicago and of several hospitals. From 1902 to 1910 he was director of the Pathological Institute for the New York State Hospitals and from 1910 professor of psychiatry and director of the Henry Phipps Psychiatric Clinic at Johns Hopkins Hospital. He was a member of many medical and scientific societies and wrote much on neurology, pathology, and psychiatry.

MEYER, EDUARD (1855-). A German historian (see VOL. XV). He discarded his English and American degrees in 1919. Among his works are *Die Aufgaben der Höheren Schule und die Gestaltung des Geschichtsunterrichts* (1918); *Cæsars Monarchie und das Prinzipat des Pompeius* (1919); *Preussen und Athen* (1919); and *Ursprung und Anfang des Christentums* (1920-22).

MEYER, HERMAN HENRY BERNARD (1864-). An American bibliographer, born in New York City. He studied at Columbia University and at Pratt Institute Library School and was for several years engaged in the profession of engineering. From 1905 he was chief of the periodical division of the Library of Congress and was also chief of the order division and chief bibliographer there. He wrote many books, including *Inland Waterways of Europe* (1910); *Employer's Liability and Workman's Compensation* (1911); *Capital Punishment* (1912); *Europe and International Policies* (1914); *Divorce* (1915); *Monroe Doctrine* (1919); *Scientific Management* (1920); *Treaty-making Power* (1920), and *Income Tax* (1921).

MEYERHOFF, OTTO. See HILL, ARCHIBALD V.

MIAMI CONSERVANCY FLOOD PROTECTION. See FLOODS AND FLOOD PROTECTION.

MIAMI UNIVERSITY. A coeducational institution at Oxford, Ohio, founded in 1809. The student enrollment increased from 651 in 1914-15 to 1556 in 1923-24, the faculty membership from 51 to 102, and the number of volumes in the library from 47,000 to 71,500. An addition was built to the library at a cost of \$142,000; the university hospital, the indus-

trial arts building and Wells Hall, a dormitory for girls, were completed and work was under way on Ogden Hall, a new men's dormitory, a freshman dormitory, the McGuffey addition, and a new recitation building, in 1924. A tract of 93 acres was added to the campus. President, Raymond M. Hughes.

MICHAELIS, SOPHUS (1864-). A Danish author (see VOL. XV). His later publications include *Hellener og Barbaren*, a story of the Persian wars (1914); *Digte*, poems (1919); *Dommeren, a novel* (1921); *Himmelskibet* (1921); and *Manden fra Elba* (1921).

MICHELSON, A. A. See PHYSICS.

MICHIGAN. Michigan is the twenty-second State in size (57,980 square miles), and the seventh in population; capital, Lansing. The population increased from 2,810,173 in 1910 to 3,668,412 in 1920, a gain of 30.5 per cent. The white population rose from 2,785,247 to 3,601,627; negro, from 17,115 to 66,082, native white, from 2,189,723 to 2,874,992; and foreign-born white, from 595,524 to 726,635. The urban population of the State increased from 1,327,044 to 2,241,560; the rural decreased from 1,483,129 to 1,426,852. The growth of the principal cities was as follows: Detroit (q.v.), 1910, 465,766; 1920, 993,678; Grand Rapids (q.v.), 112,571 to 137,634; Flint (q.v.), 38,550 to 91,599, Saginaw, 50,510 to 61,903; Lansing, 31,220 to 57,327. The phenomenal growth of Detroit during the decade was due to its extraordinary industrial development, chiefly in the manufacture of automobiles and their accessories.

Agriculture. Michigan is one of the important agricultural States. Conditions during the decade 1910-20 reflected the fluctuations of production and value in the period during and following the War. This general situation is discussed in the article AGRICULTURE and in separate articles on the chief agricultural products. While the population of the State increased 30.5 per cent in the decade 1910-20, the percentage of the population living in rural territory declined from 60.7 in 1900 to 52.8 in 1910 and 38.9 in 1920. The number of farms decreased 5.1 per cent (from 206,960 in 1910 to 196,447 in 1920). The area of land in farms, however, showed a slight increase, from 18,940,614 acres in 1910 to 19,032,961 acres, or 0.5 per cent; and the improved land in farms from 12,832,078 to 12,925,521 acres, or 0.7 per cent. The total value of farm property showed an apparent increase, from \$1,088,858,379 to \$1,763,334,778, or 61.9 per cent; the average value per farm from \$5261 to \$8976. The prices of farm land increased materially, stimulated by war prices for farm products. In interpreting these values, and, indeed, all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The percentage of land used for agricultural purposes in 1910 was 51.5 per cent; in 1920, 51.7 per cent. The percentage of improved land in farms increased from 34.9 to 35.1. Of the total of 196,447 farms in 1920, 159,406 were operated by owners, 2319 by managers, and 34,722 by tenants. The corresponding figures for 1910 were 172,310, 1961, and 32,689. White farmers in 1920 numbered 195,714,

compared with 206,014 in 1910; colored, 733, compared with 946. Farms free from mortgage in 1920 numbered 72,869, compared with 88,705 in 1910; those under mortgage, 78,758, compared with 82,631. The total number of cattle in 1920 was 1,586,042, compared with 1,497,823 in 1910. Dairy cattle, 1,256,141, compared with 767,083; sheep, 1,209,191, compared with 2,306,476; hogs, 1,106,066, compared with 1,245,833. The estimated production of the principal farm crops in 1923 was as follows: corn, 60,190,000 bushels; spring wheat, 125,000; winter wheat, 16,456,000; oats, 48,508,000; rye, 6,538,000; barley, 3,466,000; potatoes, 30,013,000; hay, 3,320,000 tons; and sugar beets, 897,000 short tons. Comparative figures for 1913 are: corn, 56,112,000 bushels; wheat, 12,776,000; oats, 45,000,000; rye, 5,362,000; barley, 2,108,000; potatoes, 33,600,000; and hay, 2,520,000 tons.

Mining. Michigan is an important producer of two minerals, iron ore and copper, the relative production of which, in the decade 1914-24 is indicated by the following figures. For iron ore, the production in 1914 was 10,796,200 long tons; 1915, 12,514,516; 1916, 18,071,016; 1917, 17,868,601; 1918, 16,899,341; 1919, 15,438,930; 1920, 17,610,742; and 1921, 7,283,492; while in 1922 there was shipped from the mines 12,457,856 long tons. Of copper there was produced in 1914 164,344,058 pounds, in 1915, 205,283,378; 1916, 273,692,525; 1917, 255,710,123; 1918, 226,794,139; 1919, 178,826,486; 1920, 154,695,073; 1921, 86,370,028, and 1922, 121,712,365. The decrease in output of both iron and copper ores in the last two years of the period was due chiefly to the general business depression whose results were shown in diminished use of iron and copper. In addition to these two minerals, there are also produced considerable quantities of manganiferous ore, salt, sand and gravel, and stone. The total value of the mineral products of the State in 1921 was \$69,551,198, compared with \$166,338,818 in 1920; \$122,973,774 in 1919; \$158,312,121 in 1918, and \$57,743,555 in 1914.

Manufactures. Michigan is one of the most important manufacturing States. It ranks first in the automobile industry, which acquired great importance in Detroit and other cities. There were, in 1920, 28 cities of more than 10,000 inhabitants, forming 51.6 per cent of the total population of the State; and these, in 1919 reported 81.8 per cent of the total value of the State's products. In 1909 there were in the State 9159 manufacturing establishments; in 1914, 8724; and in 1919, 8305. Persons engaged in manufacture numbered 271,071, 320,611, and 549,069; and capital invested amounted to \$583,946,965, \$869,143,114, and \$2,340,954,312, in those years. The value of the products in 1909 amounted to \$685,109,169; 1914, \$1,086,102,432; and 1919, \$3,466,188,483. The extraordinary increase in value of products, 1914-19, was, however, due largely to the change in industrial conditions brought about by the War, and cannot properly be used to measure the growth of manufactures during the census period, 1914-19; but the increase in number of persons engaged in manufacture clearly indicates a decided growth in the manufactures of the State. The most important industry in point of value of product is the manufacture of automobiles, the output of which, in 1909, was valued at \$96,651,000; in 1914, \$398,289,-

000; and in 1919, \$1,620,383,000. Foundry and machine shop products, ranking second in this respect, were valued in 1909 at \$45,399,000, in 1914, \$64,576,000; and in 1919, \$324,354,000. The manufacture of steam, gas, and water engines, which developed chiefly after 1914, is third in importance, with a product valued in 1919 at \$101,989,440. Shipbuilding, in fourth place, had a product valued in 1909 at \$5,034,000; in 1914, \$2,823,000; and in 1919, \$85,153,000. The chief manufacturing city of the State is Detroit, having 2036 manufacturing establishments in 1909, with a product valued at \$252,939,000; in 1914, 2036 with \$400,348,000, and in 1919, 2176 with \$1,234,520,000. Detroit is the chief city in the country in the manufacture of automobiles and parts. Grand Rapids, the city of great furniture manufacturing establishments, in 1909 had 524 manufacturing establishments, with a product valued at \$42,231,000; in 1914, 594 with \$49,792,000; and in 1919, 611 with \$109,135,000. Other important manufacturing cities are Flint, Lansing, and Saginaw.

Education. Educational progress in Michigan during the decade 1914-24 was steady and marked. In relation to the other States of the Union, according to the reports of the Russell Sage Foundation, Michigan rose from nineteenth place in 1910 to tenth in 1918. Only nine States made a more rapid growth in the period 1890-1918. During the decade much important legislation was enacted, including laws providing for a minimum term of nine months, for one year of professional work above a four-year high school course for teachers, and State supervision of private, parochial, and denominational schools, a consolidated school law under which 43 rural high schools had been organized at the end of 1923; a tuition law which furnished high school advantages to the students of inaccessible communities; and State aid measures for partially impoverished districts and for classes for various types of handicapped children. The decade was also notable for the growth of the normal schools and teachers' colleges and for the vastly increased attendance, together with much new building, in the normal schools, the University, and the land grant college. The school population of the State increased from 815,849 in 1913 to 1,038,897 in 1922; and the enrollment in the public schools from 595,725 to 752,525. The total amount spent for education in 1922 was \$54,059,857. The percentage of illiteracy in Michigan decreased from 4.2 in 1910 to 3.9 in 1920. Among the native white population it decreased from 1.3 to 0.8 per cent; and among the negro, from 6.9 to 4.9. Among the foreign-born there was an increase of from 9.6 to 10.5.

Finance. For finances, see STATE FINANCES.

Political and Other Events. The decade 1914-24 contained an abundance of political happenings. It saw the rise of Henry Ford as a political figure in the State and nation. Elections were held in 1914 for governor and other State officers and for a Congressman. The Democrats reelected Woodbridge N. Ferris as governor, but the remainder of the State ticket elected was Republican. The Republicans also carried the Legislature. A "blue sky" law passed by the Legislature of 1913 was declared invalid in 1914 by the Federal Court of the eastern district of Michigan. The 1915 Legislature reenacted the law in valid form.

At the presidential preference primary election in April, 1916, Henry Ford received a plurality of the Republican votes, and the State delegation, in obedience to his mandate, voted for him on the first ballot at the national convention, but later swung to Charles E. Hughes. In the State elections of this year, Albert E. Sleeper, Republican candidate, was elected governor, with the rest of the State ticket; Charles E. Townsend, Republican, was reelected United States Senator. In the presidential voting, Charles E. Hughes received 339,097 votes; President Wilson, 286,775. At this election a constitutional amendment providing for State-wide prohibition was adopted, it became operative on May 1, 1918. At the State elections held in April, 1917, all candidates on the Republican State ticket were elected. On Dec. 22, 1917, four Germans were convicted of activities against the United States. These included attempts to destroy the Welland Canal and several bridges. Elections were held in 1918 for United States Senator and for governor and other State officers. As candidates for the Senate, Truman H. Newberry, Republican, and Henry Ford, Democrat, were nominated; Newberry was elected by a plurality of 7567. Shortly after the election, charges of having expended money in the primaries in excess of the limit fixed by Federal law were made against him, and an investigation was undertaken by a Federal grand jury in New York. It was held that the investigation should be by a Federal grand jury in Michigan. A protest was filed with the Senate Committee on Elections against Newberry's right to a seat, but it was not sustained. Albert E. Sleeper, Republican, was reelected governor, and the Republicans elected all the members of the Legislature except two. At the State elections in April, 1919, women for the first time exercised full suffrage rights in Michigan. The woman suffrage constitutional amendment was ratified at the general election in November, 1918, after rejection in 1912 and again in 1913. A proposed amendment to the liquor law, permitting the sale of light wines and beers, was defeated at this election. In October, 1919, the Federal Department of Justice began grand jury proceedings in the western Michigan Federal court district to investigate charges of excessive expenditures by Truman H. Newberry in his election to the Senate. This body, on Nov. 29, 1919, returned indictments against 135 persons on the charge of violating the Federal laws. Those indicted included Senator Newberry, his brother, John S. Newberry, and many others prominent professionally, industrially, and politically. Senator Newberry and 15 others were found guilty. An appeal was taken to the United States Supreme Court, and the convictions were reversed on the ground that the act under which they were convicted was invalid in that it applied to elections and not to primary nominations. At the State election in April, 1919, an amendment was ratified authorizing the issue of \$50,000,000 for State highway improvements. At this election the entire Republican State ticket was elected.

At the general election in 1920, the Republicans made a clean sweep, and by the largest majority in the history of the State, Alexander J. Groesbeck was elected governor. The Republicans carried all 13 Congressional districts and elected every member of both houses of the

Legislature. In the presidential contest of this year, W. G. Harding received 762,865 votes; J. M. Cox, 233,460. A proposed amendment to abolish parochial schools was defeated. Elections were held in 1922 for State officers and for United States Senator and representatives in Congress. Charles E. Townsend, a candidate for reelection, was nominated in the primaries. The Democrats nominated Woodbridge N. Ferris, who had been governor of the State from 1913 to 1917. The chief issue in the election was the Newberry case. Senator Townsend had defended Senator Newberry in addresses during the Senate investigation and the campaign. Mr. Ferris was elected. He was the first Democrat to be elected to the United States Senate for Michigan in 70 years. The Republicans, however, reelected Governor Groesbeck and the rest of the State ticket, carried 12 of the 13 Congressional districts, and elected all but five of the 132 members of the Legislature. Several months before the general election of 1922 the Supreme Court decision reversing the conviction of Senator Newberry and his political associates in the campaign of 1918 was handed down. About the same time, after a Senate committee investigation, a resolution to unseat him was rejected by the Senate. However, directly following the election of this year, when the Newberry case was the chief issue in the Senatorial campaign, Newberry resigned as Senator, and Governor Groesbeck appointed James Couzens, mayor of Detroit, to succeed him. In the State election held in April, 1923, the Republicans elected their entire State ticket. In the presidential primaries held in April, 1924, President Coolidge received a large majority of the Republican votes. In a contest for the Democratic presidential nomination, Henry Ford defeated Senator Ferris. Ford was entered in the Democratic primaries without his consent, after having given notice that he would support President Coolidge. The State delegation to the national convention in New York therefore disregarded the plurality for him in the primaries and presented Senator Ferris to the convention as Michigan's choice for the presidential nomination.

Legislation. The most important acts of the Legislature in the decade 1914-24 are noted below. A war loan of \$5,000,000 was authorized for carrying on recruiting service and for caring for the dependents of enlisted men. The Legislature of 1919 authorized the creation of a State police force. It also created an Industrial Relations Commission with the duty of investigating general industrial conditions and created a State public utilities commission. Statutes defining and punishing criminal syndicalism and sabotage were passed. On Jan. 2, 1919, the Legislature ratified the Federal prohibition amendment and on January 10 the Federal woman suffrage amendment. In 1921 the Legislature approved a constitutional amendment authorizing a bond issue of \$30,000,000 for the soldiers' bonus. This amendment was ratified in the election in April of the same year. Bills were passed consolidating and centralizing State governmental authority. As a result, 33 departments, commissions, and bureaus were condensed into five departments, and a State administration board was created, consisting of the governor, secretary of state, treasurer, auditor-general, attorney-general, superintendent of public instruction, and high-

way commissioner. A special session in this year was held to put into effect the soldiers' bonus. A second special session was held as a result of a deficiency in the State appropriations. The Legislature of 1923 passed a measure punishing bribery of public employees; enacted a measure making it unlawful to publish or to accept wagers on races, games, or uncertain events; passed a uniform flag law; made the sale of narcotics a felony; amended the child labor laws, and gave to the State Prison Commission the management of industrial plans for prisoners. A special session of the Legislature was held in September, 1923, to rearrange the State Senatorial districts and to reapportion the Congressional districts, as the constitution directs must be done every 10 years; but a deadlock prevented the passage of a redistricting bill. In 1923 Governor Groesbeck inaugurated a system for building State concrete roads on State account with prison labor. In 1924 about 800 State prisoners so employed were paid \$1.25 a day and their keep.

MICHIGAN, UNIVERSITY OF. A coeducational State institution at Ann Arbor, Mich., founded in 1837. The enrollment of the university increased from 6258 in 1913-14 to 11,762 (estimated) in 1923-24. The faculty was increased in the same period from 535 to 848 members, the library from 350,000 to 546,000 volumes, and that portion of the income derived from the mill tax levied by the State was increased from \$1,029,060 to \$3,000,000. Many new buildings were erected during the decade. Two women's dormitories were built in 1915 and a third was completed in 1920. The natural science building was constructed in 1915, the general library in 1918, a laundry building in 1917, the Michigan Union in 1918, and the storeshed in 1916. In 1922 the storehouse and the storeshed were doubled in size by a new addition. The new university hospital building was begun in 1919, and it was expected that it would be completed by 1925. During the year 1923 the new engineering shops and laboratories, the Teachers' Training School, the William L. Clements Library of American History building (the gift, with the library collection itself, of Regent Clements), and the first unit of the new physical science building were completed. An addition to the Dental College in 1922 doubled its accommodations for students. The first unit of the literary building, the first unit of the new medical building, and the first unit of a large group of new buildings for the Law School were begun in 1923. From July 1, 1917, to June 30, 1925, the special appropriations from the State for new buildings, lands, and equipment amounted to \$9,950,000. Senator James Couzens gave \$600,000 for a new nurses' home, and an anonymous donor gave a new group of law buildings. Another anonymous donor gave \$150,000 for a research expedition to the Near East. The dental course was lengthened to four years in 1918. The Honorary Fellowship in Creative Art was held in 1921-23 by the American poet, Robert Frost, and in 1923-24 by Dr. Robert Bridges, the poet laureate of England. Marion LeRoy Burton, Ph.D., LL.D., succeeded Harry Burns Hutchins as president in 1920.

MIDDLEBURY COLLEGE. A coeducational, nonsectarian institution at Middlebury, Vt., founded in 1800. The college grew rapidly in

size during the decade 1914-24, with an enrollment for the earlier year of 340 students and for the later, 538. The faculty increased correspondingly from 31 to 50 members; the library, from 45,000 to 50,000 volumes. The productive funds were increased from \$600,000 to \$2,182,732. In 1915 the Mead Memorial Chapel was given to the college by John A. Mead Paul Dwight Moody, D.D., succeeded John Martin Thomas, D.D., LL.D., as president in 1921.

MIKKELSEN, EJNAR (1880-). A Danish explorer (see VOL. XV). Among his publications are *Tre Aar paa Gronlands Ostkyst* (1914); *Norden Far Loo og Ret*, a story (1920), translated as *Frozen Justice* (1922); and *John Dale*, a novel (1921).

MILHAUD, DARIUS (1892-). A French composer, born at Aix-en-Provence. After graduation from the Paris Conservatoire he settled in Paris as composer and lecturer. One of the most rabid of the futurists, he believes that the works of Beethoven and Wagner ought not to appear on any modern programme. In 1923 he visited the United States, conducting some of his works and lecturing at several universities. He wrote an opera, *La Brébis Égarée* (Paris, 1923); a ballet, *L'Homme et Son Désir* (Paris, 1921); three symphonies for string orchestra; two symphonic suites; *Poème* for piano and orchestra; five string quartets; and other chamber music.

MILHAUD, GASTON (1858-1918). A French philosopher. With his death in 1918, French philosophy lost a rare type of scholar, combining a vast fund of historical and scientific erudition with a creative critical mastery. He sided with the pragmatists in their attack on the stereotyped intellectualism of the schools but was withal a rationalist who had faith in reason and in its spontaneous self-imposed discipline. His *Descartes Savant* was published posthumously in 1921. It is a collection of well-documented studies revealing a side hitherto little known of the thinker often styled "the patron saint of French philosophy."

MILITARISM. See WAR IN EUROPE.

MILITARY TRAINING CAMPS. See ARMIES AND ARMY ORGANIZATION.

MILITIA. See ARMIES AND ARMY ORGANIZATION.

MILK SUPPLY. See DAIRYING.

MILLAY, EDNA ST. VINCENT (1892-). An American author, born in Rockland, Me. She received her bachelor's degree from Vassar College in 1917 and since then has lived in New York City. She is the author of *Renascence and Other Poems* (1917); *Figs from Thistles* (1920), *Second April* (1921); *Aria da Capo* (1921); *The Lamp and the Bell* (1921), and *Two Slaterns and a King* (1921). Her work is finely conceived, and she is regarded as one of the foremost poets in America to-day.

MILLE, PIERRE (1864-). A French novelist (see VOL. XV). He developed an entertaining and artistic novel along the lines of the old-fashioned "romance." Among his later writings are *Le Monarque* (1914), *Sous Leur Dictée* (1917); *Trois Femmes*; *Histoires Exotiques et Merveilleuses*; *Nuit d'Amour sur la Montagne* (1920); *L'Ange du Bizarre* (1921); *Nyrrhine: Images Exotiques et Françaises*; *Monsieur Barbe Bleue . . . et Madame* (1922).

MILLER, ALICE DUEB (1874-). An

American author, born in New York City. She graduated from Barnard College in 1899 and in the same year married Henry Wise Miller. Her stories cleverly portray certain aspects of social life. Her works include: *The Modern Obstacle* (1903); *Calderon's Prisoner* (1904); *Less Than Kin* (1909); *Blue Arch* (1910); *Are Women People?* (1915); *Come Out of the Kitchen* (1916); *Ladies Must Live* (1917); *Wings in the Night* (1918); *The Charm School* (1919); *Manslaughter* (1921); and *Are Parents People?* (1924).

MILLER, DAVID HUNTER (1875-). An American lawyer, born in New York City. He graduated from the New York Law School in 1910 and in the year following was admitted to the bar and began practice. He served as special assistant in the Department of State in Washington in 1917 and 1918 and was attached to the mission of Colonel House in Paris. During the peace negotiations he acted as technical adviser to the American Commission and with J. B. Hurst drew up the final draft of the Covenant of the League of Nations. After a short service in the Department of State he became counsel to the German government on the Upper Silesian question before the League of Nations in 1921. He served in the Spanish-American War and was the author of *Secret Treaties of the United States* (1910); *Reservation to Treaties* (1919); *International Relations to Labor* (1921), and many monographs and articles on international and legal subjects.

MILLER, DAYTON CLARENCE (1866-). An American physicist, born at Strongsville, Ohio, and educated at Baldwin University and Princeton. During 1888-89 he was professor of natural science at Baldwin University and in 1890 went to the Case School of Applied Science as instructor in mathematics and physics, where he became professor of physics in 1895. Dr. Miller contributed important papers to scientific journals on the velocity of light in magnetic field, relative motion of earth and ether, efficiency of incandescent gas light, photographic registration of sound waves, quality of musical sounds, and similar subjects. In 1914 he gave a course of lectures before the Lowell Institute. Besides his many papers, he is the author of *Laboratory Physics* (1903). *Boehm on the Flute and Flute Playing* (1908), and *The Science of Musical Sounds* (1916).

MILLER, JOHN ANTHONY (1859-). An American astronomer, born at Greensburg, Ind. He studied at Indiana, Stanford and Chicago Universities. He was instructor in mathematics at Indiana and superintendent of schools in Rockville, Ind., after which he taught mathematics at Stanford and returned to Indiana in 1894, where in 1895 he became professor of mechanics and astronomy. In 1906 he was called to the chair of mathematics and astronomy at Swarthmore College, of which he became vice president (1913-), and director of the Sproul Observatory (1911-). He was chief of the solar eclipse expedition sent by the University of Indiana to Spain in 1905 and of that sent by Sproul to Brandon, Colo., in 1918. His studies of stellar parallax, the solar corona, and measurements of double stars resulted in valuable contributions to the progress of astronomy. Dr. Miller is the author of *Trigonometry for Beginners* (1896) and *Analytic Mechanics* (1915).

MILLER, RICHARD E. (1875-). An American artist (see Vol. XV). He was elected to the National Academy in 1915 and in the same year won the medal of honor of the Panama-Pacific International Exposition. He had in the previous year been awarded the Potter Palmer medal and the \$1000 prize of the Art Institute of Chicago and the Thomas S. Clark prize of the National Academy of Design.

MILLERAND, ALEXANDRE (1850-). A French statesman (see Vol. XV). He was general commissioner of the Republic of Alsace and Lorraine in 1919-20, and Minister of Foreign Affairs in January, 1920. In the same year he became President of the French Republic. After defeat in both Houses of Parliament, when the majority voted not to sustain any government named by him, President Millerand resigned on June 11, 1924. Among his later publications is *La Guerre Libératrice* (1918).

MILLIKAN, ROBERT ANDREWS (1868-). An American physicist, born at Morrison, Ill. He studied at Oberlin and Columbia and in Göttingen and Berlin, and in 1910 became professor of physics at the University of Chicago. In 1921 he became director of the Norman Bridge Laboratory of Physics at the California Institute of Technology at Pasadena. He also lectured at California (1917) and at Amherst (1917). His original researches had much to do with the composition of matter. He was the first to succeed in isolating an electron. Professor Millikan's brilliant successes gained for him the Comstock prize of the National Academy of Sciences in 1913 and the Nobel prize in physics in 1923. During the War he was vice-chairman of the National Research Council and afterward chairman of the science and research division of the Signal Corps, with the rank of lieutenant-colonel. In addition to membership in many scientific societies at home and abroad, he is a fellow of the American Academy of Arts and Sciences, a member of the American Philosophical Society, and since 1915 a member and foreign secretary of the National Academy of Sciences. He is the author of textbooks and other volumes which include: *A Course of College Experiments in Physics* (1898); *Mechanics, Molecular Physics, and Heat* (1901); *Electricity, Sound and Light* (1908); and *The Electron* (1917).

MILLS, JAMES EDWARD (1876-). An American chemist, born at Winnsboro, S. C., and educated at Davidson College and at the University of North Carolina. During 1900-10 he taught at the State university and became associate professor in 1904. After some years on the faculty of the University of South Carolina, he became professor there in 1913. In 1921 he was appointed technical director of research and development work for the Chemical Warfare Service at Edgewood Arsenal. During the War he was a captain in the Engineer Corps (1917) and then passed to the Chemical Warfare Service (1918). His special researches, on which he published papers, had to do with subjects in the field of physical chemistry, such as molecular attraction, heats and vaporization of liquids, and specific heats.

MILLS COLLEGE A college for women at Oakland, Cal., founded in 1885. The number of students increased from 127 in 1914 to 546 in 1924, the faculty from 37 to 72 members and the library from 15,000 to 31,000 volumes. The

productive funds rose from \$260,550 to \$1,290,284, the endowment from \$452,280 to \$1,470,938 and the annual income from \$71,545 to \$471,545. An ambitious building programme was carried on during the period. Alumnae Hall was completed in 1916; Warren Olney Hall, a \$120,000 residence hall, in 1917; an annex to Science Hall in 1918, Orchard House in 1918 at a cost of \$65,000; Meadow House in 1921 at a cost of \$70,000; and the Mary Keyser Chemical Laboratories, grouped about a central court, in 1922. Aurelia Henry Reinhardt, Ph.D., LL.D., succeeded Luella Clay Carson, Litt D., as president.

MILLSPAUGH, ARTHUR CHESTER (1883-). An American administrator of Persian finances, born at Augusta, Mich., and educated at Albion College, the University of Illinois, and Johns Hopkins. After teaching political science for two years and working in the drafting office of the United States State Department for three more, he became acting foreign trade adviser in 1921-22. When Persia requested that an American financial adviser be sent to Teheran, Dr. Millspaugh was appointed, and he and his staff reached the Persian capital in November, 1922. He found the Persian treasury empty and the fiscal administration a chaos, but with the help of the Persian authorities and the military, he straightened matters out. A budget was established, taxes were collected, and brigandage greatly diminished.

MILLSPAUGH, CHARLES FREDERICK (1854-1923). An American botanist, born at Ithaca, N. Y., and educated at Cornell University and the New York Homeopathic Medical College. For several years he practiced medicine and from 1891 to 1893 taught botany at West Virginia University. In 1894 he was appointed curator of the department of botany of the Field Museum of Natural History; from 1897 to 1923 he was professor of medical botany at the Chicago Homeopathic Medical College. He was also lecturer on botany at the University of Chicago. Millspaugh carried on explorations in the West Indies, Brazil, and other parts of South America, and was the author of *American Medical Plants* (1887), *Flora of West Virginia* (1891), and many articles in scientific and popular journals.

MILNE, A(LAN) A(LEXANDER) (1882-). An English journalist and playwright, educated at Cambridge. He is best known in America for his plays. He was assistant editor of *Punch*, 1906-14, and served with the Royal Warwickshire Regiment during the War. His plays include: *Wurzel-Flummery* (1917); *Belinda Make-Believe* (1918); *Mr Pim Passes By* (1919); *The Romantic Age* (1920); *The Truth About Blayds* (1921); *The Dover Road* (1922); *The Great Browopp* (1923) and *Success* (1923). Among his other publications are *The Day's Play*; *The Holiday Round*; *Once a Week*; *Once on a Time*; *Not That It Matters*; *If I May*; *Mr. Pim*; *The Red House Mystery*; *The Sunny Side*.

MILNER, ALFRED, first VISCOUNT (1854-1925). An English statesman and administrator (see VOL. XV). After a long retirement from politics, he became a member of the war cabinet, without portfolio, in 1916, and in the following year conducted a mission to Russia. In 1918 he was Secretary of State for War and in 1919 Secretary of State for Colonies. In 1920 he was head of the Commission to Egypt

and made the report on conditions there which resulted in the establishment of the independent rule of that country.

MILWAUKEE. The largest city in Wisconsin. The population rose from 373,857 in 1910 to 457,147 in 1920 and to 492,087, by estimate of the Bureau of the Census, for 1924. The board of public land commissioners was active in city planning between 1914 and 1924. A zoning ordinance regulating the height, use and area of buildings in the various districts of the city was adopted in 1920. Land was acquired for a civic centre adjoining the public library-museum and the auditorium. It involved the condemnation of 11 additional city blocks, the construction of a mile-long, 180-foot plaza extending to Lake Michigan and the enlargement of Juneau Park at the end of the plaza where the outlined lake drive will begin. A park and boulevard system, in coördination with the directed platting of new subdivisions, and the construction of playgrounds within half a mile of each child were under way in 1924. The greater part of the land along Lake Michigan has been acquired by the city. The garden homes housing development, which was entered into jointly by the city and county in 1920, was said to be the first of its type in the United States. Land was purchased, and by 1924, 105 houses were completed and sold to citizens on the installment plan, to be owned on a coöperative basis.

The greater harbor project involving the construction of an outer harbor in Kinnickinnic Bay, the development of an extensive system of docks and warehouses, and the unification of railway terminals was carried forward by the harbor commission. Land in Jones Island was reclaimed for the outer harbor by dredging the waterway and filling behind new bulkheads. The Federal government was constructing 1700 additional feet of caisson breakwater. A \$13,000,000 modern sewage disposal plant on Jones Island, operating on the activated sludge system of disposal and capable of handling 100,000,000 gallons of sewage a day, was half completed in 1924, and 33 miles of deep intercepting sewers and 9.4 miles of main sewer were being built. In 1921 the city completed a municipal street lighting system of gas-filled incandescent tungsten lamps. A new intake and new \$1,000,000 pumping station were constructed, a trailer system of ash and garbage collection was installed, and mechanical snow loading machines were adopted. The health department also was very active, supervising the health of children in the schools and holding child welfare clinics. The continuation school, completed in 1923, under an independent tax levy and governed by an independent board selected by employers and employees, was praised as a model school by educators in the United States and Europe. Almost 7000 children and apprentices were enrolled for day sessions and over 6000 adults at night, pursuing courses of study in 100 subjects. The public library, extending its service, was the first to supply a trained worker in adult education to reach the various extension classes, clubs, trade unions, and other organizations, and giving each hospital patient bedside book service. The Art Institute first received municipal support in 1918, which culminated in 1922 in an agreement whereby the city was to acquire full ownership in 1932. In

1923 a civic symphony orchestra was started, giving concerts biweekly in the auditorium. Milwaukee attained the best financial standing and credit of all the cities in the country as the result of a scientific budget system, the elimination of all bonds for operating expenses, the rapid changing of all departments to a cash basis, half completed in 1924, and the economies made possible by a centralized purchasing department paying cash for all work, including contracting. An amortization fund, established in 1923, was expected ultimately to wipe out the entire public debt. The offices of 12 aldermen-at-large were discontinued. See CITY PLANNING.

MILWAUKEE-DOWNER COLLEGE. A college for women at Milwaukee, Wis., founded in 1849. The number of students increased from 278 in regular courses and 67 in extension in the year 1914-15 to 352 in regular courses and 98 in extension in 1923-24, and the number of faculty members from 37 to 42. The library increased from 10,875 volumes and 1400 pamphlets to 19,400 volumes and 10,000 pamphlets, and the productive endowment funds rose from \$216,207 to \$799,857. The curriculum was expanded during the 10 years by the introduction of a two years' course in occupational therapy, first offered during the War, and courses in public school music, with diploma at the end of two years, library economy, and Spanish. The degree of Bachelor of Science in Nursing was introduced in 1918. Lucia R. Briggs, M.A., succeeded Ellen C. Sabin, M.A., Litt.D., as president.

MILYUKOV, PAVEL NIKOLAEVITCH (1859-

—). A Russian politician and historian. He was educated at the University of Moscow from which he was expelled for a time for taking part in students' riots. After graduation he lectured at the university till dismissed in 1894 because of his liberal opinions. He was later appointed professor at the University of Sofia, Bulgaria, and afterwards lectured successfully in the United States. Returning to Russia in 1905, he took part in forming the constitutional democratic party (Cadets), becoming its leader and editing its organ *The Retch*. He was elected to the third and fourth Dumas. In 1914 he favored the Allies but felt that the men then ruling Russia should be overthrown. Later he opposed Kerensky's policy. After the Armistice he went to London and then to Paris, and in 1921 he directed the journal, *Last News*.

MINE, SUBMARINE. In the War the submarine mine played a most important part. The numbers used and the areas planted were so enormously greater than in any previous war—indeed, than in all previous wars combined—as to make such former use seem trivial. The various types of mines were much improved during the War and the methods of planting and sweeping were revolutionized. Both the British and Germans were much impressed by the use of mines in the Russo-Japanese War and were prepared at the outbreak of hostilities to use them in great numbers. At this time, due to war experience, the Russian mine was probably the best but, as the Germans picked up Russian mines early in the war, they were able to improve their own. British, French, Italian, and American mines were improved by experience and from inspection of captured German mines, but it was not until September, 1917, that the

improved British mine began to be turned out in adequate quantities. The improved American mine began to be manufactured in enormous numbers in the latter part of 1917. Some new types of mines were developed during the War such as the depth bomb (see BOMB, DEPTH) and the British net mine. The Leon drifting mine, which was brought out just before the War, was used with great effect in the Dardanelles where the conditions exactly suited it.

As each nation endeavors to keep the design of its mines as secret as possible, descriptions of British and American mines are not published. The plans of the German mines were derived from a careful examination of captured ones. The mooring rope reel was secured to the mine-case and not to the anchor. Anchor and mine were held together by a device locked with a sal-ammoniac plug. When dropped, mine and anchor sank slowly to the bottom where they remained until the dissolving of the sal-ammoniac plug allowed glycerine to escape from beneath a plunger in a dashpot. The mine was then released and rose until, at the required depth below the surface, the reduction of pressure allowed a clamp to securely grip the anchor rope. The main firing circuit was closed by the tension on the mooring rope as soon as the mine started upward, but the battery was still inoperative. Several contact horns protruded from the case, each horn consisting of a small lead cylinder enclosing a glass tube that contained the electrolytic fluid. Directly below each horn and inside the case there was a brass cylinder that had in its upper part the terminal plates of a battery the wires from which passed through a wooden plug into the detonating fuse, though each zinc wire is brought to the filling hole where the circuit is kept broken while the mine is being handled. Over each lead contact horn was screwed a brass safety cylinder that was removed before the mine was dropped. When one of the contact horns was struck by a passing vessel, the lead cylinder was bent and the glass container inside it broken. The electrolyte then poured into the brass cylinder beneath and completed the formation of a battery that produced a current and exploded the mine. Though their efficiency was admitted, neither the German nor the Russian mine was copied in England as their cost (about \$1000) was deemed excessive.

The Leon floating mine was invented by a Swedish officer. It is cylindrical in shape and may be dropped in the usual way or expelled from a torpedo tube. The weights are so adjusted that it floats with its axis vertical. The upper half contains the explosive and firing mechanism and the lower half is divided into a water reservoir, that fills where the mine is dropped, and the compartment for the depth mechanism. The latter consists of a battery and motor, driving a propeller on a vertical shaft, and a hydrostat which starts the propeller to lift the mine when it sinks beyond the designed depth and stops it when it reaches the upper limit. With the chamber filled the mine is only slightly heavier than water and is easily kept from 5 to 15 feet below the surface.

At the outbreak of war the Germans promptly laid minefields along their own coast and began laying small areas or lines off the British coast. The first British minefield was laid ear-

ly in October north of Ostend and designed to check the passage of German submarines through the Channel. Others were placed off British harbors. During 1915, 15 small minefields were laid off the Belgian Coast and others in German waters. In that year the Germans first began to use submarine mine-layers and in 1916 the British also used them. In the latter part of 1916 the British laid the Belgian Coast barrage, 12 miles off the Belgian Coast and 40 miles long, supplemented by mine nets about a mile from the mines.

Early in 1917 a deep net barrage was laid across the Straits from the Goodwins to Snou Bank, supplemented with deep set mines. The nets dragged and the field had to be swept and relaid. During the year 1917, 15,686 mines were laid by the *Abdiel* (ex-destroyer) and five mine-laying submarines. But it was not until September, 1917, that an efficient mine began to be turned out in adequate quantities to warrant undertaking any of the extensive projects that had been under consideration.

The greatest of these projects was the closing of the entrances to the North Sea—the channel at Dover and the northern passage from the Orkneys to Norway, the latter requiring a mine-field 250 miles long. The mines were dropped at 300-foot intervals and there were 10 rows at a depth of 65 to 80 feet, 4 at about 160 feet, and 4 at about 240 feet. The work was begun in March, 1918. In May, the American Mine Squadron No. 1, consisting of nine large mine-layers having a total capacity of 5530 mines, arrived at Invergorden, Scotland. The work was completed in the next five months. The British laid 13,546 of their own mines; the American squadron laid 56,571 American mines and 899 British; total, 70,117. The Dover barrage contained 9500 mines.

The mine played a most important part in the war. Its threat of danger curbed the activities of U-boats by compelling them to proceed to their destinations by difficult channels over vastly longer distances; and, of about 200 boats lost, 43 are known to have been destroyed by mines. Probably 7 or 8 of those whose fate is unknown were sunk in minefields, while many others were so badly injured as to force a return to base. The British losses from mines were:—5 battleships (13 lost from all causes), 1 cruiser (13 lost), 2 light cruisers (12), 5 sloops (18), 20 destroyers (64), 4 submarines (54).

Extensive mining operations were carried out in the Mediterranean and elsewhere but compared to the great North Sea work they were relatively small. The vast number of mines laid across harbor entrances and other routes of commerce and of war vessels made the operation of mine-sweeping as important as mine-laying. The entrances to many ports were swept daily and the channels leading to others were constantly patrolled and swept if mines were reported in them or in their vicinity. On Nov. 11, 1918, the total number of minesweepers in the British service alone was 726, and large but lesser numbers were in use by the other Allies (including the United States). See VESSELS, NAVAL, *Mine-layers* and *Minesweepers*; *Naval Operations* under WAR IN EUROPE; BOMB, DEPTH; PARAVANE; BOMBING OF VESSELS, etc.

MINE LAYER, MINE SWEEPER. See VESSEL, NAVAL.

MINERALOGY. Developments in this science during the decade 1914–24 included the discovery and description of several new mineral species, experiments in the artificial production of minerals, and the study of mineral properties, chemical and physical, with the use of more refined or elaborate methods than were previously available. Among general works for students of the subject published during the period may be mentioned Bayley's *Descriptive Mineralogy* (1917), a new work, not a revision of an old one.

New Minerals. The possibilities of the occurrence of undiscovered species are still far from exhausted, apparently, for many new compounds or specific variations of known types were brought to notice each year. The listing of the new names is hardly warranted in this place, as all of them are of minor importance in both distribution and economic value, and many are simply varieties of known forms distinguished by some special property.

Experiment and Research. For investigations of the fundamental characteristics of minerals, the work of the Carnegie Geophysical Laboratory was of signal importance. Its endowment of technical equipment and the skill of its staff put the institution on a unique basis in this branch of research. One of the tasks it undertook was the investigation of the rock-forming silicates, in which much interest centres on account of their bearing on the formation and conditions of stability of the ingredients of igneous rocks. Rankin, in a study of the system lime-alumina-silica, reproduced such minerals as quartz, tridymite, cristobalite, corundum, wollastonite, sillimanite, and anorthite, besides many calcium silicates not known to occur in nature but present in certain artificial products. The results throw light also on the compounds formed in the hardening of Portland cement. Andersen experimented with the system anorthite-forsterite-silica and explained some of the features of the basic igneous rocks. Johnston, Merwin, and Williams discovered important features of calcium carbonate, particularly that the substance has three phases, two of which only had been known to occur in nature. For the experiments of Bowen in the crystallization of melts, see GEOLOGY. Allen determined the true chemical structure of the mineral bornite, one of the important copper ores. The artificial production of diamonds continued to attract interest, and the latest trials have been made by Sir Charles A. Parsons, the English inventor, who secured transparent crystals up to seven-tenths of a millimeter in diameter. Contrary to the conclusions of Moissan, who first succeeded in making diamonds, the more recent work indicated that great pressure and heat were not the essential factors in effecting the crystallization of carbon in a molten bath. It appears that the diamond forms at a temperature around 690°C, below the freezing point of the iron matrix, through the reactions of occluded gases. The results, if not wholly successful, were very suggestive and will doubtless encourage further investigation.

A means of distinguishing artificial rubies, the manufacture of which has been brought to a high state of perfection, was given by Michel. The artificial stones have a concentric banding

and lines of bubbles, arising from the process of depositing the molten aluminum oxide. The pear-shaped melt shows an optic axis diagonal to the longer diameter. No methods had been found to make synthetic emerald, topaz, peridot, or phenacite. The disperse colors of quartz, according to Watson and Beard, may be referred to the effects of small amounts of foreign substances, of which the commonest are manganese, iron, and titanium oxides. Amethyst contains more than the average amount of manganese, which is present in colloidal form and imparts a purple color. Rose quartz is probably not attributable to an inorganic substance, for it can be bleached by heat, after which the color cannot be restored by exposure to the sun's rays. Blue quartz contains fine rutile crystals which are arranged after a definite pattern and cause dispersion.

MINIMUM WAGE. A conspicuous feature of minimum wage legislation in the United States was that, although 10 of the 14 laws in force in 1923 applied to male minors as well as to females, in no case had an attempt been made to extend such legislation to men. Such restriction of wages, an unquestionable limitation of the right of free contract, was held justifiable under the police power as a protection to public health, safety, and morals, in the case of women as mothers and potential mothers; but not justifiable in the case of men, who, furthermore, were more successful in bargaining for themselves. Massachusetts, in 1912, was the first State to adopt such a minimum wage law. It was followed in 1913 by nine States: California, Colorado, Minnesota, Maine (declared unconstitutional in 1914), Nebraska (repealed in 1919), Oregon, Utah, Washington, and Wisconsin. Arkansas and Kansas passed their laws in 1915; Arizona, in 1917; the District of Columbia, in 1918; and North Dakota, Porto Rico, and Texas, in 1919; and in 1923 a law became effective in South Dakota. With the repeal of the Texas law in 1921, there were 13 States, in addition to Porto Rico and the District of Columbia, with such legislation, although no action had been taken under the Colorado act. A minimum wage bill was passed by the Senate but defeated by the Assembly in New York in 1924. Almost all the laws were general in scope, covering "any trade, occupation, or industry in which women and minors are employed"; although in some States certain occupations were specified or excluded, and in no State had a rate for domestic service or farm labor been fixed. In many instances there were clauses restricting the number of working hours and requiring that overtime be paid for at an increased rate; another common provision was that for the issuance of certificates to defectives, allowing them to work for a lower rate than that prescribed. With the exception of the Massachusetts law, all the State measures involved the power to fix a minimum, prescribed in the statute in three States, while in the others it depended on an award of a board or commission, based on a study by the body of living costs. In Massachusetts, which had the award system of determining the wage, the law was not mandatory and depended for its enforcement on public sentiment. An effort to make violation of the law a misdemeanor and punishable as such and so to bring the Massachusetts bill into line with all the others in this respect, was defeated in 1923, when a spe-

cial commission, after an investigation, brought in an adverse report. In most States the amount of the award is based on a study of the cost of living and is given in terms of a weekly wage rate. To what extent the wages of women and minors were affected by this legislation from 1914 to 1924 is difficult to determine. The fixed minimum varied, in the same year, not only with age and experience and class of labor, but also with regard to the population of localities, in addition to this, the rise in the cost of living and the inflation of currency must be taken into account. Attempts to set a living wage for women, however, seem to have aimed generally at a weekly rate from \$8 to \$9 between 1914 and 1917; in 1918, in Washington, at \$9 for minors and \$13.20 for experienced adults. In 1923, \$13.30 and \$12 for the experienced adult in Massachusetts and South Dakota, respectively, compared with a minimum of \$16 in California and Arizona, and a minimum as low as \$7 for smaller towns in some of the States. Available records indicated that the setting of a minimum had little if any tendency to decrease the maximum wage. Activity during the decade consisted largely of the issuance of orders extending the minimum wage principle to various classes of industries and the enactment of measures to close up loopholes of evasion. A characteristic expansion of the regulation is that of Massachusetts. The first decree in that State, in 1914, applied to brush-making; the second, effective in 1915, to laundries, 1916, retail stores; 1917, women's clothing factories; 1918, men's clothing and raincoats; 1918, men's and boys' furnishings; muslin underwear, petticoats, aprons, kimonos, women's neckwear, and children's clothing; millinery and office or building cleaning; 1920, candy making, corsets, knit goods, paper-boxes, etc.; in 1923, with the formation of a wage board for establishments manufacturing druggists' preparations, 17 occupations had come under review since the enactment of the law, and wage decrees had been issued for 16 occupations, affecting from 70,000 to 80,000 women. Among the controlling measures found necessary during this period was that of Massachusetts, providing, for the publication of the names of employers who persistently violated minimum wage decrees; in other States the length of apprenticeship and the proportion of apprentices was definitely set, and a sliding scale of wages for apprentices was created, to prevent discrimination against those subject to the rate for experienced workers.

The critics of minimum wage laws continued to insist that it was class legislation: it did not fix a fair day's work to protect the manufacturer; a fair living wage could not be determined; the legislation was circular in effect, raising the cost of living in proportion to the increase in wages: it produced unemployment; it put States enforcing such laws at a disadvantage compared with those which had none. Attacks on the constitutionality of such measures were continuous, beginning in 1914, when the law of Maine was declared void as an unconstitutional delegation of legislative power to an appointed body and as an interference with both employer and employee. The outstanding case, however, was that of Oregon, in 1917, when the Supreme Court of the United States split evenly on its decision, thus leaving in effect the favorable ruling of the State Supreme

Court. Following this, favorable decisions were also brought in, apparently with misgivings, on cases which had meanwhile been pending in the State Supreme Courts in Arkansas and Minnesota; and in 1918 a similar case in Washington had a like issue. In 1923, however, the Supreme Court of the United States decided against the minimum wage measure of the District of Columbia as an interference with the freedom of contract guaranteed by the due process clause of the Fifth Amendment. This decision was disconcerting. Nevertheless, the States generally, taking it to apply only to the points raised in this particular law, proceeded with the administration of their respective acts. In Arizona the State officials announced their intention to support their new wage law, which raised the minimum from \$10 to \$16 a week; and the industrial commission of California was not deterred from handing down a new wage award. The California Legislature, moreover, memorialized Congress to adopt a constitutional amendment to permit such legislation by States; and the Governor of Washington advocated a conference of governors to campaign toward that end. In Oregon, the Manufacturers' and Merchants' Association pledged support and cooperation in maintaining the State law and in discouraging any attempt to repeal it or to test its validity in the courts. On the other hand, test cases had been started in Arizona and in Wisconsin; in Massachusetts the publicity method of enforcement had been brought up for settlement. Conferences were called by various labor and other organizations to consider the situation. The general attitude seemed to be divided between a desire to curtail the power of the Supreme Court, either by requiring a seven to two or a six to three vote, or by requiring a change in their decision if an act were again passed in Congress by an increased majority, and a desire for a constitutional amendment, either broad enough to permit the enactment of all welfare or social legislation, or one making possible at least minimum wage legislation for women workers.

Other Countries. In Australia, where the first serious political step toward the prevention of sweating in industry was taken in 1896, minimum wage legislation by 1915 covered 141 trades employing over 150,000 workmen and was considered to be beyond the experimental stage. Sweating had been abolished, and opposition to the principle on the part of either capital or labor was practically non-existent. In England, the movement had steady and successful growth, beginning with the Trades Boards Act of 1909, which established a minimum wage in the sweated trades. One act, passed in 1912 to terminate a general strike among coal miners, provided that a certain minimum should be part of their contract of service and enforceable in ordinary courts of law. A minimum wage was fixed for agricultural laborers by the Corn Production Act of 1917. The principle, in fact, was much in use during the War to keep wages consistent with the increased cost of living; the Trades Boards Act was extended in 1914 to cover additional occupations, affecting 400,000 workers, chiefly women; after the Armistice it was made use of to keep wages from falling suddenly during the period of adjustment. A new Trades Boards Act, passed in 1918, greatly extended the scope of the previous measure. By the end of 1922 there were in ex-

istence 63 boards, covering 39 trades and affecting the wages of approximately 3,000,000 workers, both men and women. Over a period of 14 years, the system appeared to have been effective in securing more commensurate wages even for the semiskilled and the skilled worker, and in reducing the normal number of hours per day and the amount of overtime; it did not seem, either through eliminating the less efficient worker or through driving employers out of business, to have had any effect on unemployment. That it was not wholly satisfactory, however, was indicated by a bill providing for certain changes, which failed of passage in 1923. Although the first minimum wage regulation in Canada was a clause of the Factories Act of Alberta as late as 1917, seven of the provinces (all except New Brunswick and Prince Edward Island) had such laws, by 1923; five of them included also provisions for hours; all of them, with the exception of the Alberta clause, applied only to women and children. The British Columbia law (1918) provided for a board to ascertain wages paid and to call a conference of employers, employees, and public representatives to fix and enforce suitable wages; it exempted from the provisions farm laborers, fruit pickers, and domestic servants; the Manitoba law (1918) applied only to shops, mail order houses, or factories in cities, but gave jurisdiction in limitation of hours and sanitary and other conditions; Quebec, in 1919, established a board with power of investigation; Saskatchewan's board, created in that year, was given power to fix wages without calling a conference; the laws of Ontario and Nova Scotia came into force in 1920. In France, special wage boards were created, in 1915, to fix a minimum piecework rate based on prevailing wages, applying chiefly to women engaged in home work in the clothing industry; and their power was extended in 1922 to include other industries employing home labor. Norway, in 1918, provided a home workers' commission, to establish special boards in any trade, on request, and to fix minimum wages for both time-work and piecework; in Prussia, in 1918, a Wages Department was formed under the general supervision of the German Wages Department. Switzerland, where the ultimate wage-fixing authority rested with the state department, established a number of wage boards during the period; and Argentina, in its budget law of 1923, provided for a minimum wage for government employees. See LABOR LEGISLATION; LAW, PROGRESS OF, *Constitutional Law*.

MINNEAPOLIS. The largest city of Minnesota. The population increased from 301,408 in 1910 to 380,582 in 1920, and 417,280, by estimate of the Bureau of the Census, for 1924. A city planning commission was created in 1919 following the proposed city plan prepared two years previously; this, in turn, was followed by a zoning law under the authority of which a zoning ordinance was adopted by the city council. A central coordinating financial body was created in 1919 under the title of Board of Estimate and Taxation, the Board of Charities and Corrections was reorganized into the Board of Public Welfare, and a Municipal Pension Board was created. In 1920 the city voted to accept home rule, and in the following year a citizens' charter committee proposed a new city manager charter, which was under discussion in 1924.

Minneapolis was made head of navigation on the Mississippi in 1917 on completion of the government high dam. The city had prepared preliminary terminal facilities. Four important bridges were built spanning the Mississippi, one over the Falls of St. Anthony; another was the Cappelen Memorial, containing the world's largest single concrete arch of 400 feet, a third was constructed in cooperation with St. Paul. Two monumental bridges were under construction in 1924, one nearly a mile long, over the Minnesota River. An extensive building programme, especially developing the junior high schools, placed Minneapolis in fourth rank in percentage enrolled in the high schools. The park system was enlarged by the addition of 491 acres, and over 24 miles of boulevards and parkways were paved. Funds for a new auditorium were voted by the Legislature and ratified by the voters. After investigation of the street lighting methods of many cities in 1922, a beginning was made on the installment of a new system. In 1919 a proposed new street railway franchise was rejected by referendum, and two years later the Legislature placed the street railway company, for valuation and rates, under the Railroad and Warehouse Commission.

MINNEAPOLIS SYMPHONY ORCHESTRA. See MUSIC, Orchestra.

MINNESOTA. Minnesota is the eleventh State in size (84,682 square miles), and the seventeenth in population; capital, St. Paul. The population increased from 2,075,708 in 1910 to 2,387,123 in 1920, a gain of 15 per cent. The white population rose from 2,059,227 to 2,368,936; negro, from 7084 to 8809; native white, from 1,516,217 to 1,882,772. The foreign white population decreased from 543,010 to 486,164. The urban and rural populations both showed increases: the former from 850,294 to 1,051,593; the latter from 1,225,414 to 1,335,532. The growth of the principal cities was as follows: Minneapolis (q.v.), 1910, 301,408; 1920, 380,582; St. Paul (q.v.), 214,744 to 234,698; Duluth (q.v.), 78,466 to 98,917.

Agriculture. As Minnesota is one of the principal grain-growing States, agricultural conditions in the decade 1914-24 were largely affected by the fluctuation in prices and production which characterized the War and post-war period. (See articles AGRICULTURE, CORN, WHEAT, etc.) The number of farms in the decade 1910-20 kept pace almost exactly with the increase in population; the population increased 15 per cent, the number of farms, 14.3 per cent (from 156,137 to 178,478). The acreage of land in farms increased from 27,075,823 to 30,221,758, or 9.2 per cent; and the improved land in farms, from 19,643,533 acres to 21,481,710, or 9.4 per cent. The total value of farm property showed an apparent increase, from \$1,476,411,737 in 1910 to \$3,787,420,118 in 1920; the average value per farm, from \$9456 to \$21,221. Farm land values greatly increased, as a result of war prices for farm products. In interpreting these values and indeed all comparative values for the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The percentage of the total land area in farms increased from 53.5 in 1910 to 58.4 in 1920; the percentage of improved land in farms,

from 38 to 41.5. Of the total of 178,478 farms in 1920, 132,744 were operated by owners, 1596 by managers, and 44,138 by tenants. The corresponding figures for 1910 were 122,104, 1222, and 32,811. White farmers in 1920 numbered 178,271, compared with 155,844 in 1910; colored farmers, 207, compared with 293. Farms free from mortgage in 1920 numbered 54,086; mortgaged, 69,545. In 1910 65,038 farms were free from mortgage and 56,145 were mortgaged. The total number of cattle in 1920 was 3,021,469; in 1910, 2,347,435. Dairy cattle numbered 2,080,627 and 1,083,388, in those years. This indicates the steady growth of the dairy industry. The State had reached second place in butter production with Wisconsin only slightly ahead of it. Hogs increased in number from 1,520,257 to 2,380,862. The number of sheep on the farms in 1920 was 509,064, compared with 637,582 in 1910. The estimated production of the principal farm crops in 1923 was as follows. corn, 152,987,000 bushels; spring wheat, 20,513,000; oats, 146,623,000; rye, 12,312,000; barley, 23,159,000; potatoes, 38,815,000; hay, 2,547,000 tons; and flaxseed, 5,318,000 bushels. Comparative figures, for 1913, are: corn, 96,000,000 bushels; wheat, 68,040,000; oats, 112,644,000; rye, 5,700,000; barley, 34,800,000; potatoes, 30,250,000; and hay, 2,490,000 tons.

Mining. Minnesota is the leading State in production of iron ore. Although it produces also important quantities of clay products, cement, and stone, it is iron which sets it high among mineral producing States. Minnesota was eleventh in value of mineral products in 1921. The fluctuations in output of iron ore in the decade 1914-24 are indicated by the following comparative figures: 1914, 21,946,901 long tons; 1915, 33,464,660 long tons; 1916, 44,585,422; 1917, 44,595,232; 1918, 41,953,969; 1919, 36,000,626; 1920, 39,453,173; 1921, 17,811,325. In 1922, 30,209,372 long tons were shipped from the mines. The diminished production in 1921 was due largely to the general business depression, which lessened demand for the products of iron ore. The value of the clay products, exclusive of pottery, fluctuated from \$1,944,886 in 1914 to \$1,503,659 in 1918; \$3,341,477 in 1920; and \$2,482,286 in 1921. In addition to the minerals mentioned above, there are also produced in the State manganiferous ore, mineral waters, and sand and gravel. The total value of the mineral products in 1921 was \$72,609,973; \$177,589,967 in 1920; \$131,529,797 in 1919; \$155,412,823 in 1918; and \$45,680,865 in 1914.

Manufactures. Minnesota is an important industrial State. In 1920 there were 11 cities with populations over 10,000, forming 33.6 per cent of the total population. These cities, in 1919, produced 63.3 per cent of the State's manufactured products. There were in the State, in 1909, 5561 manufacturing establishments; in 1914, 5974; and in 1919, 6225. Persons engaged in manufacture numbered 104,406, 115,690, and 147,678; and capital invested amounted to \$275,416,029, \$354,434,177, and \$679,386,486, in those years. The value of the manufactured products in 1909 amounted to \$409,419,621; in 1914, to \$493,354,136; and in 1919 to \$1,218,129,735. The increase in value of products from 1914 to 1919 was to a great extent due to changes in industrial conditions brought about by the War and cannot properly be used

to indicate the growth of manufactures between the censuses of 1914 and 1919, but the increase in number of establishments and in number of persons engaged in manufacture shows clearly a considerable growth in the manufacturing activities of the State. Flour mill and gristmill products were chief in point of value; in 1909, \$139,136,000; 1914, \$148,244,000; and 1919, \$381,249,000. Slaughtering and meat packing is the second industry in this respect: in 1909, \$25,754,000, in 1914, \$47,710,000; and in 1919, \$146,919,000. The manufacture of butter and cheese ranks third, amounting in 1909, to \$25,287,000; in 1914, to \$33,746,000; and in 1919, to \$91,720,000. The product of the lumber and timber industry, in fourth place, was valued at \$42,353,000 in 1909, \$44,675,000 in 1914; and \$52,580,000 in 1919. The principal manufacturing cities are Minneapolis, St. Paul, and Duluth.

There were in Minneapolis, in 1909, 1102 manufacturing establishments, with a product valued at \$163,405,000; in 1914, 1349 with \$187,854,000, and in 1919, 1421 with \$491,383,000. In St. Paul, in 1909, there were 719 with \$58,990,000; in 1914, 737 with \$63,682,000; and in 1919, 818 with \$149,038,000. Similar figures for Duluth were: in 1909, 194 with \$17,180,000; in 1914, 243 with \$19,729,000; and in 1919, 226 with \$75,261,000.

Education. Substantial progress was made in educational development in Minnesota, in the decade 1914-24. School districts were authorized to establish special departments for the instruction of physically handicapped children, subnormals, the deaf, blind, defective of speech, and crippled, and a special grant of \$100 to \$300 per child was allowed by the State for this work; provision was made through the State Department of Education for the rehabilitation of disabled persons; a law was passed requiring physical training and health instruction in all public schools and in all institutions for the training of teachers; and a new supplementary State aid law was enacted, guaranteeing to every school district \$40 per child on a \$.02 tax levy in addition to all other forms of State support, with the State paying the difference between what a \$.02 tax levy would produce for each pupil involved, and \$40. The school enrollment increased from 457,041 in 1914 to 540,843 in 1923, the number of teachers, from 16,920 to 20,841. The expenditures for all public schools was, in 1922, \$38,986,486. In 1923, the permanent school fund amounted to \$33,750,529. The percentage of illiteracy in the State decreased from 4 in 1910 to 2.4 in 1920; among the native white, from 0.5 to 0.4; among the foreign-born white, from 7.7 to 5.6; among the negro, from 3.9 to 3.5.

Finance. For finance, see STATE FINANCES.

Political and Other Events. The decade 1914-24 was an important one in the political history of the State. Minnesota, together with other northwestern States, was greatly affected by the agricultural situation in the years following the Great War. Among the farmers the so-called Farmer-Labor party acquired sufficient power to elect candidates for important offices, including two United States Senators. In 1914, in the elections for governor and other State officers and Representatives in Congress, W. S. Hammond, the Democratic candidate, was elected governor. The Republicans elected Representatives in all districts except one. On Au-

gust 12 of this year, the International Harvester Company was declared to be a monopoly in restraint of trade, and its dissolution was ordered by the United States District Court of St. Paul. In the elections of 1916, Minnesota was one of the so-called doubtful States. The voting for President was extremely close. Charles E. Hughes received 179,553 votes and President Wilson 179,157 votes. In the elections for State officers the Republicans elected their candidate for governor, J. A. A. Burnquist, and F. B. Kellogg was elected United States Senator. The Republicans again were successful in the elections of 1918, when Governor Burnquist was reelected, as was Senator Knute Nelson. The Non-Partisan League took part in the campaign and showed considerable strength. In 1919 A. C. Townley, president and organizer of the National Non-Partisan League (see NORTH DAKOTA), was convicted of disloyalty and sentenced to three months' imprisonment by the Martin County district court at Fairmount. Elections were held again in 1920 for governor and other State officers. The Republican candidate for governor, J. A. O. Preus, was elected, defeating H. K. Shipstead, Independent Farmer-Labor. In the presidential election of this year W. G. Harding received 519,421 votes and J. M. Cox 142,994. At this election the people approved amendments authorizing the construction of a trunk highway system, the taxation of motor vehicles, and the assessment of all real property used for railway purposes. In 1922 the Republicans again elected Governor Preus, but the Farmer-Labor organization developed such strength that it was enabled to defeat Senator Kellogg and to elect its candidate for the Senate, H. K. Shipstead. At this election the State voted to loan its credit for the assistance of farmers. As the result of the death of Senator Nelson in 1923, a special election was held to fill the vacancy. Governor Preus was nominated by the Republicans and James A. Carley by the Democrats. The Farmer-Labor party nominated Magnus Johnson, who in 1922 was an unsuccessful candidate for governor. After a stirring and picturesque campaign, Mr. Johnson was elected. F. B. Kellogg, former Senator, was appointed Ambassador to Great Britain in 1923.

Legislation. The most important acts of the legislature in the decade 1914-24, are noted below. The legislature, in 1915, passed a local option bill on a proposed amendment providing for State-wide prohibition, which was defeated in the House. The Senate defeated a bill providing for the submission to the voters of a constitutional amendment granting full suffrage to women. The legislature of 1917, however, provided for the submission of both the woman suffrage amendment and the prohibition amendment to the people in 1918. This legislature enacted a "blue sky" law and made provision for the voting of citizens absent from the State in the national service. It also created a public safety commission. The prohibition amendment lacked the necessary three-fifths vote, but the 1919 Legislature ratified both the proposed prohibition and women's suffrage amendments. It also provided for an eight-hour day on public work, and passed statutes defining and punishing criminal syndicalism and sabotage. The Legislature of 1921 regulated aircraft and created the office of Commissioner of Agriculture and empowered him to aid coöperative

bodies engaged in buying and selling farm products. The manufacture or sale of adulterated or misbranded drugs was forbidden. The office of Labor Commissioner was abolished and an Industrial Commission was created. Provision was made for the enforcement of the laws relating to intoxicating liquors. The compulsory school laws were amended, a workmen's compensation insurance board was created; and amendments were made to the workmen's compensation law. In 1923 the legislature passed a measure forbidding the wearing of masks in public places with the intent to conceal the wearer's identity. A measure was also enacted to facilitate cooperative marketing of agricultural products, and provisions were made for creating associations for this purpose.

MINNESOTA, UNIVERSITY OF. A State institution, founded in 1868, with its main campus in Minneapolis, the department of agriculture in St. Paul, the graduate medical school in Rochester, and agricultural experiment stations in Crookston, Morris, Grand Rapids, Duluth, Waseca, and Zumbra Heights. In 1913-14, the number of resident students of collegiate grade was 4155; the total registration, including extension, subcollegiate, etc., was 8992. In the fall term of 1923-24, the resident students of collegiate grade numbered 8992; total registration, 13,594. The total annual residence registration of collegiate grade, including summer session, was above 12,000. The growth between these two dates was steady, except for 1917-18, when the collegiate registration was 5567. The faculty increased over the 10 years from 608 to 1250, the library from 175,000 to 380,000 volumes, and the income from \$2,445,491 to \$7,088,094. The method of instruction was changed in 1918 from the semester to the quarter system. A School of Business was established and courses in Americanization training work, training for the diplomatic and consular services, for State and Federal administration, and for municipal administration and engineering, and courses for teachers and supervisors of physical education were added. The dental course was lengthened from four to five years, the extra year to be taken in pre-dental work in the College of Arts and Sciences. Under a legislative appropriation voted in 1919, of \$560,000 a year for 10 years, the following new buildings were finished or in the course of construction in 1923-24: on the main campus, a music building costing \$259,000; mines experiment station building costing \$311,000; library, \$1,255,000; storehouse and shops building, \$154,000; an addition to the Minnesota Union, \$50,000; on the farm campus, two home management houses at a cost of \$30,000, and a dairy building costing \$215,000; at Crookston, an animal products building costing \$16,000, and a beef cattle barn to cost \$12,000; at Morris, a hospital to cost \$14,000. Dr. William J. Mayo and Dr. Charles H. Mayo of Rochester, Minn., have given over \$2,000,000 for medical research and examination. A trust fund of \$250,000 was established in 1923 by the Citizens' Aid Society of Minneapolis for the erection of the George Chase Christian Memorial Cancer Hospital. In the same year a site valued at \$100,000 was given for the Minnesota Hospital and Home for Crippled Children by William H. Eustis, as the first installment of a gift for buildings and grounds for the univer-

sity, which will eventually amount to \$1,000,000; pledges to the amount of approximately \$2,000,000 were made by alumni and friends for the erection of an athletic stadium and an auditorium; and two loan funds, one of \$5000 and one of \$12,000, were established in the names of Edward M. and Effie R. Johnson. George Edgar Vincent was president of the university until he resigned in 1916 to accept the presidency of the Rockefeller Foundation, when he was succeeded by Marion LeRoy Burton, who resigned in 1920 to become president of the University of Michigan. President, Lotus Delta Coffman

MINNICK, JOHN HARRISON (1877-). An American educator, born at Somerset, Ind., and educated at Indiana, Illinois, Chicago, and other universities. For several years he taught in high schools in Indiana and Illinois, and from 1911 to 1913 he was critic teacher of mathematics at Indiana University. For two years following he was instructor in mathematics at the Horace Mann School at New York City. In 1916 he became instructor of mathematics at the University of Pennsylvania and was successively assistant professor of education, professor of education, and dean of the school of education at that university. He was a member of many learned societies, wrote *An Investigation of Abilities Fundamental to Geometry* (1918), and developed standardized tests in geometry.

MINNIGERODE, MEADE (1887-). An American writer, born in London. He graduated from Yale in 1910 and for several years was associated with publishers in New York. He represented the United States Shipping Board in France in 1917-18 and in the year following was first lieutenant with the American Red Cross. His books include *Laughing House* (1920); *The Big Year* (1921); *O, Susanna* (1922); and *The Fabulous Forties* (1924), a graphic and amusing picture of New York in the time of Dickens.

MIOMANDRE, FRANCIS DE (1880-). A French novelist, born at Tours, and educated at Marseilles. He began writing in his early twenties and won the Prix Goncourt in 1908 for his novel, *Ecrit sur de l'Eau*. His novels are highly imaginative and put together with the genuine talent of a romancer who has traveled far and wide at his own study table. His works include: *Du Vent et de la Poussière*; *L'Ingénu*; *L'Aventure de Thérèse Beauchamps*; *Le Veau d'Or et la Vache Enragée*; *Les Taupes*; *Ces Petits Messieurs*; *Les Jeux de l'Amour et de la Danse*; *La Cabane d'Amour*; *Journal Interrompu*; *Pavillon du Mandarin*.

MIQUELON. See ST. PIERRE AND MIQUELON.

MISSISSIPPI. Mississippi is the thirty-first State in size (46,865 square miles), and the twenty-third in population; capital, Jackson. The population decreased from 1,797,114 in 1910 to 1,790,618 in 1920, a loss of 0.4 per cent. The white population rose from 786,111 to 853,962, but was still greatly exceeded by the negro population, in spite of the fact that the number of negroes decreased from 1,009,487 to 935,184 during the decade. The native white population increased from 776,722 to 845,943, while the foreign-born white decreased from 9389 to 8019. The urban population of the State mounted, from 207,311 to 240,121; the rural population, on the other hand, decreased from 1,589,803 to 1,550,497. The growth of

Meridian was from 23,285 in 1910 to 23,399 in 1920; Jackson, 21,262 to 22,817 Vicksburg, with 20,814 in 1910 and 18,072 in 1920, showed a decrease

Agriculture. As the raising of cotton is one of the chief agricultural industries of the State, conditions during the decade 1910-20 were greatly affected by the ravages of the boll weevil, which occupied most of the State by 1909 or 1910. This is indicated by a comparison of the acreage and production of various years during the period: in 1913, 3,067,000 acres, 1,311,000 bales; 1915, 2,735,000, with 954,000 bales; 1917, 2,788,000, with 905,000 bales; 1921, 2,628,000, with 813,000 bales; 1922, 3,078,000, with 989,000 bales. During 1923 more than usual damage was done to the cotton plant, and the abandonment of cotton farming was much heavier than usual; the forecast for production was 752,000 bales. For a more detailed account of the ravages of the boll weevil in the cotton growing States, see *BOLL WEEVIL*.

While the population of the State decreased 0.4 per cent in the decade, the number of farms decreased 0.8 per cent (from 274,382 in 1910 to 272,101 in 1920). The area of land in farms decreased 1.9 per cent, from 18,557,533 to 18,196,979 acres; and while the improved land in farms increased from 9,008,310 acres to 9,325,677, the total percentage of land used for agricultural purposes decreased from 62.5 to 61.3. The total value of farm property showed an apparent increase of from \$426,314,634 in 1910 to \$964,751,855 in 1920; the average value per farm, from \$1554 to \$3546. In interpreting these values and indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 272,101 farms in 1920, 91,310 were operated by owners, 989 by managers, and 179,802 by tenants. The comparative figures for 1910 were 92,066, 825, and 181,491. White farmers in 1920 numbered 110,882, compared with 109,645 in 1910, colored, 161,219, compared with 164,737. There was a decrease in negro population, 1910-20, of 7.4 per cent, compared with an increase of more than 11 per cent in the preceding decade, which quite seriously affected the farm labor situation. Farms free from mortgage in 1920 numbered 91,310; 92,066 in 1910. In 1920, 23,990 were mortgaged, compared with 29,693 in 1910. The number of dairy cows in 1920 was 530,274, compared with 429,587 in 1910; "beef cows," 261,682, compared with 138,930; hogs, 1,373,311, compared with 1,292,119; mules, 308,216, compared with 253,866; sheep, 164,440, compared with 156,230. The estimated production of the chief farm crops in 1920 was as follows: corn, 38,137,000 bushels; oats, 2,581,000; potatoes, 1,144,000; sweet potatoes, 9,094,000; hay, 548,000 tons; peanuts, 10,744,000 bushels. For cotton, see above. Comparative figures for 1913 are: corn, 63,000,000 bushels; oats, 2,800,000; potatoes, 960,000; and hay, 293,000 tons.

Manufactures. Although Mississippi is not one of the leading industrial States, it has many important industries. See *UNITED STATES, Manufactures*.

Education. Mississippi has educational problems of great difficulty. The colored popu-

lation exceeds the white, and in addition to this the rural localities are many of them thinly populated, and widely separated. In the decade 1914-24, notable advances were made. There was put into operation a splendid system of consolidated schools, which in 1923 numbered 751; and a compulsory school law was put into force, which brought into the schools during the first year of its operation over 33,000 white boys and girls over 7 years of age who had never before attended school. An equalizing school fund was provided, of more than \$1,125,000, to be disbursed by the State Board of Education for the benefit of the poorer sections of the State. The State Normal School, established in 1912, was enlarged, and had at the close of this period an enrollment of approximately 1500. The trustees of the schools of every county had been organized for several years in the County Trustees' Association, and the 82 county superintendents of the State were organized into a State association. In the latter part of the period the work of rehabilitation of cripples and vocational education had been organized and was producing excellent results. The high school work in over 1000 schools doing from 1 to 4 years of high school work had been standardized. There were 237 four-year accredited high schools, and hundreds of others doing from 1 to 3 years of accredited work. Enrolled in the colleges of the State in 1923 were as many students as were contained in the high schools in 1913; during the preceding two years a \$5,000,000 bond issue was expended in repairing and expanding the State colleges and institutions. The white enrollment in the high schools in 1923 was 28,000; in the colored high schools, 4000. The total public school enrollment was placed around 550,000, as compared with 469,137 in 1909-10. The percentage of illiteracy in the State decreased from 26.8 in 1910 to 20.8 in 1920; among the native white population, from 6.2 to 4.4 per cent; among the foreign-born white, from 13.6 to 13.4; among the negro, from 43.2 to 35.9.

Finance. For finances, see *STATE FINANCES*.

Political and Other Events. Mississippi remained steadfastly Democratic in the decade 1914-24. In 1916 Senator Williams was re-elected, practically without opposition. In the presidential election of this year, President Wilson received 80,422 votes; Charles E. Hughes, 4253 votes. At this election an amendment was adopted increasing the number of Supreme Court judges to six, to be elected by the people for a term of eight years. Elections were held in 1917 for United States Senator. Former Senator Vardaman contested the nomination of Representative Harrison, who was nominated and elected. Senator Vardaman was opposed by President Wilson, who declared that the election of Vardaman would be a condemnation of the Wilson administration. In 1919, Lee M. Russell was reelected governor. In 1922 elections were held for United States Senator, and Hubert Stephens defeated former Senator Vardaman for the nomination. In elections held in 1923, Henry L. Whitfield was elected governor for the term 1924-28. On Feb. 18, 1920, the Legislature rejected the woman suffrage amendment.

MISSISSIPPI, UNIVERSITY OF. A coeducational State institution at University, Miss., founded in 1848. With the usual exception of the war years the university grew steadily dur-

ing the decade 1914-24, with an enrollment at the beginning of that period of 523, a faculty of 35, and a library of 25,000 volumes, as compared with an enrollment of 801, a faculty of 46, and a library of 35,000 volumes at the close. The income of the university also increased, from \$138,226 to \$167,000; five new dormitories and a pharmacy building were constructed, and a School of Commerce and Business and a department of hygiene were opened. Chancellor, Joseph Neely Powers, LL.D.

MISSOURI. Missouri is the eighteenth State in size (69,420 square miles), and the ninth in population; capital Jefferson City. The population increased from 3,203,335 in 1910 to 3,404,055 in 1920, a gain of 3.4 per cent. The white population rose from 3,134,932 to 3,225,044; negro, from 157,452 to 178,241. The native white population showed an increase from 2,906,036 to 3,039,018, while the foreign-born white decreased from 228,896 to 186,026. The urban population mounted in the decade from 1,398,817 to 1,586,903; the rural population decreased from 1,894,518 to 1,817,152. The growth of the principal cities was as follows: St. Louis (q.v.), 1910, 687,029; 1920, 772,897; Kansas City (q.v.), 248,381 to 324,410; St. Joseph, 77,403 to 77,939; Springfield, 35,201 to 39,631.

Agriculture. As Missouri is one of the most important agricultural States, conditions in the decade 1914-24 reflected the fluctuation in prices and production which characterized the war and post-war periods. See AGRICULTURE.

Missouri is one of the minor cotton-producing States, and while the region where cotton is grown had lately become infested by the boll weevil, the insect was held back by the cold winters, and its ravages were not serious. Figures for area and production for several years are: 1913, 112,000 acres; production, 67,000 bales; 1916, 133,000 acres, 63,900 bales; 1920, 136,000, 79,000 bales. The production in 1922 was 149,000 bales; the estimated production for 1923, 198,000. It will be noted that since Missouri suffered less than most of the other affected States from the boll weevil, there was an increase in the area grown. In Missouri, in contrast with the situation in most of the other great agricultural states, the number of farms did not increase in proportion to the growth of the population in the decade. Whereas the population increased 3.4 per cent, the number of farms decreased 5.1 per cent (from 277,244 in 1910 to 263,004 in 1920). The total area in farms increased from 34,591,248 acres to 34,774,679, or 0.5 per cent; the improved land in farms, from 24,581,186 to 24,832,966 acres, or 1 per cent. The percentage of the total land used for agricultural purposes increased from 78.6 to 79.1 per cent; the proportion of improved land in farms, from 55.9 per cent to 76.5. The total value of farm property in the State showed an apparent increase from \$2,052,917.488 in 1910 to \$3,591,068.095 in 1920; the average value of farms, from \$7405 to \$13,654. In interpreting these values and indeed all comparative values for the decade 1914-24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 263,004 farms in 1920, 185,080 were operated by owners, 2247 by managers, and 75,727 by tenants.

The comparative figures for 1910 were 192,285, 2001, and 82,958. White farmers in 1920 numbered 260,178, compared with 273,578 in 1910; colored, 2826, compared with 3666. Farms free from mortgage in 1920 numbered 82,099; under mortgage, 85,538. In 1910, 102,514 farms were free from mortgage; 88,486 were mortgaged. The total number of cattle in 1920 was 2,781,644 compared with 2,561,482 in 1910; dairy cattle numbered 1,066,750, compared with 856,430, hogs, 3,888,677 compared with 4,438,194; mules, 255,455 compared with 265,601; sheep, 1,271,616 compared with 1,811,268. The estimated production of the principal farm crops in 1923 was as follows: corn, 204,384,000 bushels; wheat, 37,947,000; oats, 32,382,000; barley, 114,000; potatoes, 8,788,000; hay, 4,038,000 tons; sweet potatoes, 1,501,000 bushels; and tobacco, 7,434,000 pounds. Comparative figures for 1913 are: corn, 129,062,000 bushels; wheat, 39,586,000; oats, 26,500,000; barley, 110,000; potatoes, 3,230,000; hay, 1,800,000 tons, and tobacco, 3,315,000 pounds.

Mining. Missouri is first among the States in production of lead. Important quantities of coal, clay products, and cement are also mined; but it is the lead industry which gives it its chief importance as a mineral producing State, with a rank of fifteenth in value of mineral products in 1921. Fluctuations in production of lead in the decade 1914-24 are indicated in the following figures: 1914, 192,612 short tons, valued at \$15,023,736; 1915, 210,440 short tons, \$19,781,360; 1916, 233,088, \$32,166,144; 1917, 234,156, \$40,274,832; 1918, 194,175, \$27,572,850; 1919, 163,290, \$17,308,740; 1920, 163,114, \$26,418,240; 1921, 180,085, \$16,207,650; 1922, 178,412, \$19,625,320. The greater part of the output is obtained from the southeast and central parts of the State. Coal production varied in the decade from 3,935,980 short tons in 1914 to 4,742,146 short tons in 1916; 5,667,730 in 1918; 5,369,565 in 1920; 3,551,621 in 1921; and 2,924,750 in 1922. Clay products during the decade ranged in value from \$6,077,284 in 1914 to \$7,640,995 in 1916; \$9,155,088 in 1918; \$17,474,542 in 1920; \$10,668,691 in 1921. The increased value in the latter years was due chiefly to changes in the buying power of currency which led to higher prices, since production was not greatly increased. The output of cement during the decade averaged about 5,000,000 barrels per year, but the value increased from \$4,485,744 in 1914 to \$8,034,540 in 1921, for a practically identical production, the increased value being due chiefly to the decreased buying power of money. The total value of the mineral products of the State for 1921 was \$56,375,543, compared with \$90,994,479 in 1920; \$61,862,232 in 1919; \$76,663,995 in 1918; and \$48,597,593 in 1914.

Manufactures. Missouri is an important industrial State. There are 13 cities with more than 10,000 inhabitants, containing 39.8 per cent of the total population of the State. In 1919 they reported 75.6 per cent of the value of the State's manufactured products. There were in the State, in 1909, 8375 establishments; in 1914, 8386, and in 1919, 8392. Persons engaged in manufacture numbered 185,705, 188,266, and 244,939, in those years, while the capital invested amounted to \$444,343,135, \$522,548,083, and \$938,760,773. The value of manufactured products in 1909 was \$574,111,070; in 1914, \$637,952,128; and in 1919, \$1,594,208,-

338. The large increase in value of the product in 1914-19 was due largely to changes in industrial conditions brought about by the War and cannot properly be used to measure the growth of manufactures during the census period 1914-19, but the increase in number of wage earners indicates a decided growth in the manufacturing activities of the State. Slaughtering and meat packing is the first industry in point of value of products, which amounted in 1909 to \$79,581,000; 1914, \$92,060,000; and 1919, \$247,477,000. Flour and gristmill products rank second in value: in 1909, \$44,508,000; 1914, \$38,686,000; and 1919, \$113,297,000. The manufacture of boots and shoes is third, with a productive value of \$48,751,000 in 1909; 1914, \$52,522,000; and 1919, \$142,466,000. The manufacture of automobile bodies and parts, in fourth place, had an output in 1909 valued at \$1,677,000; 1914, \$2,183,000; and 1919, \$71,939,000. The most important manufacturing cities are St. Louis and Kansas City. In St. Louis, in 1909, there were 2667 manufacturing establishments, with a product of \$328,495,000; in 1914, 2787 with \$360,480,000; 1919, 3205 with \$871,700,000. Kansas City, in 1909, had 902 with \$54,705,000; in 1914, 1052 with \$60,953,000; and in 1919, 997 with \$192,815,000. St. Joseph is also an important manufacturing city, having, in 1909, 261 manufacturing establishments, with a product of \$17,026,000; 1914, 267 with \$17,068,000; and 1919, 219 with \$50,697,000.

Education. There was steady development in the educational system of Missouri during the decade 1914 to 1924. During that period a new plan of inspecting, supervising, and classifying high schools was formulated and put into operation. The State was divided into five districts coterminous with the five State teachers' college districts, in each of which a high school inspector or supervisor was placed, who had his office at the teachers' college and was responsible for the advancement of secondary education in his district. The department also undertook two other outstanding projects, a State-wide survey of educational conditions, and the reorganization of curriculum courses of study and standards for classification of high schools of the State. Trained experts were directing both activities. Attention was also given to the development of the rural schools, and there was at the end of the period one rural supervisor for the State and five rural school inspectors; the work of these supervisors was to help the county superintendents in group and community meetings, to inspect rural schools, and in general to help teachers in their work. The plan calls for a conference of teachers, school board members, and patrons at the close of the administration work; at this meeting plans for school improvement, better supervision, and improved presentation of the work, together with the individual problems of teachers, were to be discussed and remedies suggested. The total enrollment in the elementary and high schools in 1913 was 690,484; in 1923 it was 736,592. In the latter year, the white males numbered 353,301, and the white females, 349,183; the colored males, 16,174; and the colored females, 17,864. The total expenditure for educational purposes in 1923 was \$40,499,939. The percentage of illiteracy in the State decreased from 5.4 in 1910 to 3.8 in 1920: in the native white population, from 4.3 per cent to

2.8; in the foreign-born white, from 10.2 to 10; in the colored, from 21.1 to 14.3.

Finance. For finance, see **STATE FINANCES.**

Political and Other Events. While Missouri was regarded as a solidly Democratic State for many years, it has been gradually shifting to the doubtful class. It was carried by Roosevelt and the entire Republican State ticket except governor in 1904, by Herbert S. Hadley for governor in 1908, and by the Republicans again in 1910. During the decade 1914-24, following the Republican split of 1912, the Republicans in the latter part of the period developed sufficient strength to elect candidates for governor and United States senator. At elections held in 1914 for United States senator and for representative in Congress, William J. Stone was elected to the Senate, and the Democrats elected the Representatives in all the districts except two. A proposed prohibition amendment to the constitution was defeated at this election. In 1916 elections were held for governor and other State officers. The Democratic nominee for governor, Frederick O. Gardner, was elected; the Democrats elected all the State officers except the State auditor. In the presidential election of that year, President Wilson received 398,032 votes; Charles E. Hughes, 369,339. A constitutional amendment providing for State-wide prohibition was defeated at this election, but an amendment providing for pensions for the blind was carried. Senator W. J. Stone died in 1918, and X. P. Willey was appointed by Governor Gardner to serve until the election of a successor. The Republicans elected their candidate for senator, Selden P. Spencer, who defeated the Democratic candidate, Joseph W. Folk.

In 1919, the last year of Governor Gardner's administration, he appointed Lieutenant-Governor Wallace Crossley as State Fuel Commissioner acting in conjunction with the Federal fuel authorities, to conserve and distribute properly the coal supply when a shortage was threatened by labor trouble in the mines. The Republicans in 1920 elected their candidate for governor, Arthur M. Hyde, and reelected Senator Spencer. In the presidential election of that year, Warren G. Harding received 727,162 votes; James M. Cox, 574,799. At a referendum vote at this election, the people approved the enforcement of prohibition throughout the State. In 1922 the most important political happening was the election of a United States senator. Senator James A. Reed was a candidate for reelection. He was opposed for the nomination by Breckinridge Long. Senator Reed, although he was bitterly assailed for his failure to support President Wilson in the Senate, and although the former President strongly voiced his objection to his reelection, was successful at the primaries and was nominated. In the election in November he defeated the Republican candidate, R. R. Brewster. On May 10, 1922, more than 2500 citizens of Missouri petitioned Congress to modify the Volstead Act by restoring light wines and beer. During 1923, at St. Joseph a trial of 76 so-called radicals, including William Z. Foster and others, was conducted. Foster was acquitted, but several others were convicted.

Legislation. The most important acts of the Legislature in the decade 1914-24 were as follows: The Legislature of 1915 enacted a measure designed to prevent dishonest advertising.

This prohibits misstatements of facts in any form of advertising matter. In 1917 the Legislature amended the laws relating to criminal procedure and abolished capital punishment, which was restored in 1919 at an extra session. Provisions were made for the voting of citizens absent on military service. An income tax was created and corporation, inheritance, and secured debt tax laws were passed. The secured debt law was declared unconstitutional. The banking laws were also amended in important details. By a provision of the Legislature in 1919, women were permitted to vote for president. The Legislature enacted a child labor law and a workmen's compensation law, the latter annulled by referendum. On January 6 the Legislature ratified the Federal prohibition amendment, and on July 3, in extra session, the Federal woman suffrage amendment. The Legislature of 1921 created a Commissioner of Agriculture; passed measures for the relief of the deserving blind; created a State Department of the Budget and social welfare boards in cities of the second and third class; amended the child labor laws, and created a municipal cooperative court in all counties having a population between 10,000 and 150,000. The law creating a Commissioner of Agriculture and Department of the Budget were later suspended by referendum and defeated.

The Legislature created a State Highway Commission in 1921 and provided for the construction of 7600 miles of hard-surface roads from a bond issue of \$60,000,000 voted by the people, supplemented by Federal aid. Much of this mileage was already under contract in 1924. The issuance of \$15,000,000 in bonds was authorized for the payment of a soldiers' bonus. The Legislature also created a State Department of Finance and passed a resolution to submit to the voters an amendment enabling women to hold any office in the State. This Legislature also provided for a system of workmen's compensation. This was suspended by referendum. In 1923 the Legislature passed a general prohibition act, enacted measures proposing to extend the voting privilege equally to men and women, submitted a proposed amendment for two additional judges on the Supreme Court bench, and passed a measure to facilitate the cooperative marketing of agricultural products. See CITY PLANNING.

MISSOURI, UNIVERSITY OF. A coeducational State institution at Columbia and Rolla, founded in 1839. The student enrollment increased from 2605 in 1914 to 3604 in the year 1923-24, with 1163 enrolled in the summer of 1923, and the faculty increased from 262 to 315 members. The library was increased from 165,000 to 271,000 volumes, the productive funds from \$1,250,000 to \$2,500,000, and the income from \$1,100,000 to \$2,600,000. A new building for the School of Journalism was given by Ward A. Neff in 1920, and a hospital, a gymnasium for women, a chemistry building, an agricultural building, and a War memorial building were erected in 1922. In 1921, \$50,000 was received for a home economics building, in 1922 in memory of their son, Lee H. Tate, and Mr. and Mrs. Frank R. Tate gave \$50,000 toward a law building; in 1923 they gave \$75,000. Albert Ross Hill, LL.D., was president until 1921; John Carleton Jones was acting president from 1921 to 1923, when he was succeeded by Stratton Duluth Brooks, LL.D.

MITCHELL, WILLIAM (1879-). An American army officer, born at Nice, France, and educated at George Washington University and the Army Staff College. He was with Gen. Fitzhugh Lee in Cuba and served in the Philippines in 1899. In 1903 he constructed the Alaskan telegraph system and in 1914 joined the French aviation forces in France. He was the first American officer to fly over the lines, commanded the air units of the 1st Army, and was chief of the Air Service in the Argonne offensive. He commanded the air forces at St. Mihiel and served at Cambrai, the Somme, etc. He wrote *Our Air Force* and many pamphlets and magazine articles. In 1920 he was appointed brigadier-general in the Air Service.

MOBILIZATION. See ARMIES AND ARMY ORGANIZATION.

MOFFAT TUNNEL. See TUNNELS

MOHAMMED VI (VAHID-ED-DIN) (1861-1926). A sultan of Turkey, brother of Mohammed V, whom he succeeded in 1918. He lived in seclusion until he became sultan and was suspected of having French sympathies. After the rise of the Nationalist movement under Mustafa Kemal Pasha, the sultan was merely a figurehead politically, although as caliph he was the supreme religious authority of the entire Moslem world. In November, 1922, he was deposed and left Constantinople on board the British warship *Malaya*, bound for Malta.

MOHLER, JOHN ROBBINS (1875-). An American pathologist, born at Philadelphia, Pa., and educated at Temple University, the University of Pennsylvania, and Marquette University. For several years he was a practicing veterinarian and was also in the employ of the Bureau of Animal Industry of the Department of Agriculture. In 1891 he was appointed assistant pathologist in the Bureau and was successively zoölogist, chief of the pathological division, assistant chief, and from 1917, chief of the entire Bureau. Besides translating several medical works from foreign languages, he was the author of many articles on pathology, bacteriology, and meat inspection. During the War he was a member of the Remount Board of the United States Army.

MOLDAVIA. See RUMANIA.

MOLEY, RAYMOND (1886-). An American educator, born at Berea, Ohio, and educated at Baldwin-Wallace College, Oberlin College, and Columbia University. He taught in several schools in Ohio until 1914. In 1916 he was appointed instructor and assistant professor of politics at Western Reserve University and from 1919 was director of the Cleveland Foundation. In 1918-19 he was also director of Americanization work under the Ohio State Council of Defense. He wrote *Lessons in Democracy* (1919); *Commercial Recreation* (1919); *Facts for Future Citizens* (1922); and various pamphlets and articles on the teaching of government.

MÖLLER VAN DEN BRUCK, ARTUR (1876-). A German writer, born at Solingen. He was educated and spent several years traveling in Germany, Austria, France, Italy, England, Scandinavia, and Russia. Besides editing the works of Dostoyevsky, he is the author of *Die Moderne Literatur in Gruppen und Einzeldarstellungen* (1900); *Die Variété: eine Kulturdraturgie* (1901); *Die Deutschen: Unsere Menschheitsgeschichte* (1904); *Zeitgenos-*

sen (1905), *Die Italienische Schönheit* (1913); *Der Preussische Stil* (1915); and *Das Recht der Jungen Völker* (1918).

MOLNAR, FRANZ (?-). A Hungarian playwright. He is the author of *Lihom*, which, played in New York City in 1922, presents a penetrating study of characteristic tendencies in a roughneck, and author also of *Launzi* which was unsuccessful in New York in 1923. His *Passions for Men* was seen in New York in 1923, and in the same year Eva Le Gallienne was starred in *The Swan*, a high comedy with a deft satirical thrust (1923).

MOLTKE, RAIMUND HERMANN SIEGFRIED (1869-). A German writer and economist. He studied in Leipzig and at the Art Academy in Berlin and later became librarian of the Chamber of Commerce of Leipzig. He is the author of *Gerse* (1895); *Aus Meiner Skizzenmappe* (1897), *Der Heilige Karl*, a play (1903); *Die Feder Geschafft* (1914), *Gott im Leide* (1915); *Kreuzwege des Lebens* (1916), and *Um die Mark Main* (1919). His most important works, on economic and historical subjects, are *Leipzigs Handelskorporationem* (1907); *Zuer Kapitel aus Leipzigs Handels- und Verkehrsgeschichte* (1912), *Friedrich List* (1913); *Katalog Altkaufmannscher Archive in Leipzig* (1913); *Die Deutsche Eisenbahn im Kriege* (1916); *Die Leipziger Messe im Kriege* (1917); and the biography, *Bernhard von Tauchnitz* (1916).

MOLUCCA. See DUTCH EAST INDIES.

MOMBERT, ALFRED (1872-). A German poet, born in Karlsruhe, and educated at the universities of Heidelberg, Leipzig, Munich, and Berlin. He practiced law for six years and then devoted himself to his literary work. His works include: *Der Sonnengeist* (1905); *Aeon, der Weltgesuchte* (1907); *Aeon vor Syrakus* (1911); *Der Himmlische Zecher* (1909); *Der Held der Erde* (1919); and *Aeon Zwischen den Frauen* (1920).

MONASTIR. See WAR IN EUROPE, *Balkan Front*.

MONDELL, FRANK WHEELER (1860-). An American public official, born in St. Louis, Mo., and educated in the public schools. For many years he was engaged in farming, stock-raising, and railroad construction. In 1887 he settled in Wyoming, where he took an active part in the development of the State. In 1909 he was elected a member of the first State Senate and from 1897 to 1899 was assistant commissioner of the Land Office. He was elected to Congress in 1895 and was successively reelected until 1922, when he was defeated. In the 66th and 67th Congresses he was majority leader on the floor of the House and took a prominent part in framing the legislation passed by that body. He took an active part in all the Republican conventions from 1902 to 1924, inclusive.

MONET, CLAUDE (1840-1926). A French landscape painter (see VOL XVI). During recent years Monet has continued to hold his rank as the foremost landscape painter of impressionism. For two years after the beginning of the War, he ceased painting, but during the third year he built a larger studio and completed, up to the time of the Armistice, about 14 large paintings, arranged in groups of three to five. The subjects were chiefly water-lilies,

and he presented his fine blue diptych on this subject to the French nation in honor of the Armistice. Exhibitions of his works were recently held in Paris and New York (1923).

MONGOLIA. A Chinese outer territory, with an estimated area of 1,367,000 square miles, and a population of about 2,500,000. The difficulties of communication because of lack of railways and the obstacles presented by the barren reaches of the Desert of Gobi, which cuts into the heart of the region, made for a sparsely settled population. Agriculture was impossible, with the result that the inhabitants were hunters and raisers of camels, horses, and sheep. In the period 1914-24 the Chinese were steadily penetrating into Inner Mongolia and the Desert of Gobi and beginning to apply themselves to the tillage of the soil. Inner and Outer Mongolia were joined in 1917 by a motor transport service plying between Urga and Kalgan. Urga was the chief town and centre of population. During the decade 1914-24, Mongolia's fortunes were linked with those of Russia and China. Up to the Revolution, Russian penetration into Outer Mongolia continued; a loan arranged in 1913 was financed on the security of internal revenues, a bank was established with a Russian directorate, in 1914 a scheme was projected for the financing and construction of Mongolian railways. The overthrow of the Czar not only checked the completion of these enterprises but also put Outer Mongolia at the mercy of marauding bands. Fear of Bolshevik incursions, as well as the threat of Semenov's forces operating near the border, impelled the autonomous government of Outer Mongolia to appeal to China for aid. In November, 1919, the reigning prince, the Living Buddha or Hutuktu, prompted by his advisers, asked for the cancellation of the charter of independence; some days later the Chinese government acceded by denouncing the Russo-Chinese and Russo-Mongolian treaties of 1913-14. The Chinese did not maintain their position long. Early in 1921, Baron Ungern von Sternberg, heading remnants of Semenov's anti-Bolshevik troops, marched on the Chinese at Urga, captured the town, and put the garrison to the sword. The Hutuktu was compelled to announce his sovereignty once more, though his policies were plainly dominated by the Baron Ungern. The Peking government was defied, and troops were even sent into Inner Mongolia. Ungern could not stand up against the Bolshevik army of the Far Eastern Republic and in a series of engagements his troops were defeated and he himself captured. He was executed on Sept. 15, 1921. Russian influence again became paramount. Soviet troops remained at Urga; a Mongolian national government, taking control, adopted a consistently friendly attitude toward Soviet Russia. In 1923 a Russian mission proceeded to Peking for the purpose of restoring friendly relations and reestablishing the economic agreements of 1913-14. In June, 1924, a treaty was signed which called for the restoration of Mongolia to China. Inner Mongolia, during the period, continued to be administered by Chinese officials appointed through Peking. See CHINA; RUSSIA.

MONITOR. See VESSEL, NAVAL.

MONTAGU, EDWIN SAMUEL (1879-1924). An English public official, author of the so-called

Montagu Plan (see INDIA). He was educated at Trinity College, Cambridge, and from 1906 to 1908 was Parliamentary Secretary to the Chancellor of the Exchequer. He was secretary to the Prime Minister from 1908 to 1910; from that year to 1914, Parliamentary Under-Secretary of State for India. He served as chancellor of the Duchy of Lancaster in 1915 and as Financial Secretary of the Treasury from 1914 to 1916. He was Minister of Munitions and a member of the War Committee in the latter year and Secretary of State for India from 1917 to 1922. From 1906 he was a member of Parliament from Cambridgeshire. He was made a member of the Privy Council in 1914.

MONTAGUE, WILLIAM PEPPERELL (1873-). An American professor of philosophy, born at Chelsea, Mass., and educated at Harvard University. In 1903 he became a member of the faculty of Columbia University, when he was appointed full professor in 1920. One of the six authors of the Neo-Realist programme, he has written numerous essays on the reduction of consciousness to a form of energy and on the implications of realistic philosophy in the realm of what are ordinarily called spiritual values.

MONTANA. Montana is the third State in size (146,997 square miles) and the thirty-ninth in population; capital, Helena. The population increased from 376,053 in 1910 to 548,889 in 1920, a gain of 46 per cent. The white population increased from 360,580 to 534,260; the Indian population from 10,745 to 10,956. There were, in 1910, 1585 Japanese, and in 1920, 1074; the negro population also decreased, from 1834 to 1658. The native-born white population increased from 286,936 to 440,640; the foreign-born white, from 91,644 to 93,620. Both urban and rural populations mounted during the decade, the former from 133,420 to 172,011, and the latter from 242,633 to 376,878. The growth of the principal cities was as follows: Butte, 1910, 39,165; 1920, 41,611; Great Falls, 13,943 to 24,121; Billings, 10,031 to 15,100.

Agriculture. While the population of the State increased 46 per cent in the decade, the number of farms increased 120 per cent (from 26,214 in 1910 to 57,677 in 1920), and the total acreage in farms increased to 35,070,656 from 13,545,603, a gain of 158.9 per cent. The improved land in farms increased also, from 3,640,309 to 11,007,278 acres. The percentage of land used for agricultural purposes in 1910 was 14.5; in 1920, 37.5. The total value of farm property showed an apparent increase from \$347,828,770 in 1910 to \$985,961,308 in 1920, or 183.5 per cent; the average value per farm, from \$13,269 to \$17,095. In interpreting these values and indeed all comparative values in the decade 1914-24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 57,677 farms in 1920, 50,271 were operated by owners, 899 by managers, and 6507 by tenants. The comparative figures for 1910 were 23,365, 505, and 2344. White farmers in 1910 numbered 25,018; in 1920, 56,614, of whom 41,051 were native and 15,563 foreign-born. Of the 1063 colored farmers in 1920, 987 were Indians. Farms free from mortgage in 1920 numbered 16,365, compared with 18,014 in 1910; those under mortgage, 29,897 compared

with 4820. The number of dairy cows increased to 153,425 in 1920 from 77,527 in 1910; "beef cows," from 372,798 to 514,853; while sheep decreased in number from 4,959,835 to 2,082,919. The area under irrigation increased from 1,679,084 acres in 1909 to 1,681,729 acres in 1919. The estimated production of the chief farm crops in 1923 was as follows: corn, 9,016,000 bushels; spring wheat, 44,764,000; winter wheat, 12,546,000; oats, 23,051,000; barley, 2,161,000; potatoes, 5,091,000, and hay, 1,940,000 tons. Comparative figures for 1913 are: corn, 882,000 bushels; wheat, 20,873,000; oats, 21,750,000; barley, 1,860,000; potatoes, 5,040,000; and hay, 1,188,000 tons.

Mining. Montana is an important State in the production of minerals. In former years gold, silver, and copper were the most valuable products of the mines, latterly they were surpassed by coal. The progress of the mining industry, 1914-19, is indicated by comparative figures. The production of coal in 1914 was 2,805,173 short tons, valued at \$4,913,191; 1915, 2,789,755 short tons, \$4,526,509; 1917, 4,226,689, \$8,919,136; 1918, 4,532,505, \$11,444,875; 1920, 4,413,866, \$13,923,000; 1921, 2,733,958, \$8,921,600; and 1922, 2,572,221 short tons. The production of silver varied from 12,016,460 fine ounces in 1914 to 16,494,366 in 1916; 16,797,479 in 1918; 12,579,178 in 1920; and 12,468,151 in 1922. In production of copper, Montana ranks second among the States; it is surpassed only by Arizona. In 1914 the copper output was 233,229,640 pounds; 1916, 352,928,373; 1918, 323,174,850; 1920, 177,059,260; 1921, 48,098,730; and 1922, 165,754,442. The diminished production in 1921 was due chiefly to business depression which diminished the demand for copper. Comparative figures for gold, lead, and zinc are as follows: 1914, gold, \$4,117,911; lead, 9,656,008 pounds; zinc, 111,580,544; 1916, gold, \$4,550,494; lead, 13,595,136 pounds; zinc, 229,259,075; 1918, gold, \$3,104,764; lead, 37,135,875 pounds; zinc, 209,258,148; 1921, gold, \$1,480,763; lead, 20,366,917 pounds; zinc, 23,275,966; 1922, gold, \$1,656,757; lead, 29,767,479 pounds; zinc, 11,069,818. A considerable amount of petroleum is also produced in the State, the output increasing from 340,000 barrels in 1920 to 1,509,000 barrels in 1921, and 2,449,000 barrels in 1922. In addition to the minerals noted above, quantities of graphite, iron ore, and stone are also produced. The total value of the mineral production in 1921 was \$30,161,734, compared with \$85,885,403 in 1920; \$73,630,824 in 1919; \$139,331,507 in 1918; and \$54,244,899 in 1914.

Manufactures Montana is not one of the important manufacturing States. See UNITED STATES, *Manufactures*.

Education. Montana has been one of the most efficient States in the conduct of its educational system, the Russell Sage Foundation in 1920 placed the Montana school system first among those of the United States. The public school fund, which was greatly increased during the decade 1913-23 by the sale of school lands and by grants of the State, amounted to more than \$20,000,000 and contributed an annual revenue, together with the amount received from leases of school lands, of more than \$1,000,000. The Legislature was liberal in the enactment of laws relating to schools. Development in vocational education was marked; the Smith-Hughes Law, providing Federal aid to

States, was accepted by the Legislature in 1917, and provisions were made for the coöperation of State and local boards of education in vocational training. The boards of trustees of the school districts of the States were authorized to establish and maintain Americanization schools for all mentally normal persons over the age of 16. One phase of the development is indicated by the increase in enrollment; in the public schools in 1914, 85,728 were enrolled; in 1922, 122,380 (elementary schools, 99,011). In the high schools of the State, in 1921-22, the enrollment was 18,514. The total disbursement for schools in 1922 was \$8,646,758. The percentage of illiteracy in the State decreased from 5.5 in 1910 to 2.8 in 1920. In the native-born population it remained for both periods at 0.4 per cent; among the foreign-born white population it decreased from 9.2 per cent to 6; in the negro population it decreased from 12.6 to 8 per cent.

Finance. For finances, see STATE FINANCES.

Political and Other Events. The political control of Montana in the decade 1914-24 fluctuated between the Republican and Democratic parties, with the latter ahead for a larger portion of the time. An election held in 1914 for representative-at-large was carried by the Democrats. At this election a prohibition amendment was carried. On Sept. 6, 1914, Mayor Lewis J. Duncan of Butte was removed from office after trial in the district court for neglect of duty in connection with miners' strikes. The elections of 1916 were notable in that Jeannette Rankin was chosen the first woman member of the House of Representatives. The Democrats elected their candidate for governor, S. V. Stewart; Henry L. Myers, Democrat, was re-elected to the Senate. In the presidential voting, President Wilson received 101,063 votes; Charles E. Hughes, 66,750. In 1917 there were many industrial disturbances in the mines of the State, and on August 2 of that year, Frank Little, organizer and agitator of the Industrial Workers of the World, was lynched in Butte for attempts to organize a strike in the metal mines and for denouncing the army and the Federal government. The State was on the point of persecuting him for these utterances and attempts when he was seized at night and hanged. In the elections of 1918 Miss Rankin was defeated for reelection to the House of Representatives by Carl Riddick. Senator T. J. Walsh was re-elected to the Senate. The Republicans came into power in 1920 and elected Joseph M. Dixon governor, together with other State officers. In the presidential voting of this year, Warren G. Harding received 109,430 votes; James M. Cox, 57,372. In 1922 elections were held for United States Senator; Burton K. Wheeler, the Democratic candidate, was elected. In this election two constitutional amendments were adopted. One permitted the consolidation of city, county, and town governments; the other created a State Board of Equalization. The voters also approved a referendum measure of the soldiers' bonus. This was afterward declared unconstitutional by the Supreme Court, and the Assembly voted to submit to the people in 1924 the question of amending the constitution so as to permit the granting of such a bonus.

In 1924 both Senators from Montana were much in the public eye on account of their prominence in investigations held by the Senate

Senator Walsh practically conducted the investigation into the alleged frauds and the leasing of oil reserves, while Senator Wheeler was responsible for and took a prominent part in the investigation of the administration of H. M. Daugherty, Attorney-General of the United States. Senator Wheeler was indicted in Montana for alleged infraction of the law which prohibits members of Congress from taking part in litigation in which the government is concerned. An investigation held by a Senate committee headed by Senator Borah exonerated Senator Wheeler.

Legislation. The most important acts of the Legislature in the decade 1914-24 are noted below. The Legislature of 1915 passed a measure providing for the submission of the question of prohibition to the people by referendum, to be voted for in 1916. This was carried. The Legislature of 1917 amended the laws relating to the administration of justice in the courts. It also authorized cities to adopt a commission form of government and amended the prohibition laws. On July 30, 1919, the Legislature ratified the woman suffrage amendment. At this session of the Legislature a law was passed providing for a State budget. In 1921 the Legislature revised the tax laws and imposed new taxes on the production of oil, gas, minerals, etc. In 1920 measures were passed preventing the holding of land by aliens. A measure was also enacted granting a modified old-age pension. Laws were passed putting into effect constitutional amendments passed in 1922.

MONTANA, STATE UNIVERSITY OF. A co-educational institution at Missoula, founded in 1895; a part of the University of Montana which comprises the State University at Missoula, the State College at Bozeman, the State Normal College at Dillon, and the State School of Mines at Butte. The student enrollment of the State University rose from 220 in 1910 to 1595 in the year 1922-23, with 515 in the summer of 1923. In 1923-24, the faculty had 84 members; the library contained 100,000 volumes, and the income was \$470,000. Six new buildings were completed in 1923, including a library, gymnasium, forestry building, two residence halls, and a central heating plant, bringing the total number of buildings to 20, and the investment in buildings, equipment, and grounds, to \$2,250,000. E. O. Sisson was president from 1917 to 1920 and was succeeded by Charles H. Clapp, Ph.D., in 1920.

MONTEMEZZI, ITALO (1875-). An Italian composer, born at Verona. He received his musical education at the Conservatory of Milan. Next to Puccini he is the most talented of living Italian composers. In 1919 he visited the United States, conducting the American première of his opera *La Nave* (Chicago Opera Association, Nov. 18), which had its world première in Milan (1918). His other works include the operas, *Giovanni Gallurese* (Turin, 1905), *Hellera* (ib., 1909), *L'Amore dei Tre Rè* (Milan, 1913; New York, 1914), and *La Principessa Lontana* (not yet produced); and a cantata, *Il Cantico dei Cantici*.

MONTENEGRO. The history of this state during the War was obscure, both because of its military unimportance, and more largely, because of its doubtful loyalties. From 1914 to 1918 a division of sentiment ever widened the breach between the partisans of the ruling family and the growing group that looked to Serbia for

the fulfillment of racial and nationalistic aspirations. On Aug. 8, 1914, Montenegro declared war on Austria-Hungary. The fear on the part of King Nicholas and his sons that victory for the Allies would mean the submergence of their dynasty led in 1915 and 1916 to a series of intrigues with Austria whose purpose was interpreted by Slav patriots as an endeavor to erect a Slav state in the South, ruled by one of Nicholas's sons and virtually under Austrian domination. Montenegro was overrun by the Austrian army early in 1916; in the same year, having failed to gain over the Central Powers, Nicholas abandoned his country and retired to France. This absence strengthened the hand of the Slav nationalists. In 1917, Montenegrins met with Serbs, Croats, and Slovenes at Corfu, where the pact setting forth their common principles was issued. On Nov. 26, 1918, the stamp of popular approval was put on this declaration when a National Assembly repudiated the dynasty and declared the union of Montenegro with the other southern Slav peoples. The court party, supported by Italians who sought to drive a wedge into Slav unity by encouraging Montenegrin independence, maintained that the Assembly had been elected under unfair conditions, with Serbian troops occupying the country. The course of events made even these few opponents confess defeat; Nicholas died in March, 1921; the Crown Prince Danilo abdicated in favor of a young nephew; France and England withdrew diplomatic recognition. When, in 1921, it was evident that Montenegrin delegates to the Jugo-Slav Constituent Assembly were unalterably in favor of union, it became clear that the history of Montenegro as an independent state was closed. See *JUGO-SLAVIA, History*.

MONTEUX, PIERRE (1875-). A French conductor, born in Paris. He studied at the Paris Conservatoire under Berthelier (violin: first prize), Lavignac (harmony), and Lenepveu (fugue). For some years he played the viola, first in Colonne's orchestra, then at the Opéra Comique, and during this period appeared with various ensemble organizations. In 1904 he began his career as conductor with the Concerts Monteux in Paris, at which he produced chiefly new works of impressionist composers. In 1911 he became conductor for Diaghilev's Ballet Russe in Paris and subsequently made four European tours with that organization, with which he also came to the United States in 1916. During the summer of 1917 he gave a series of concerts with the Civic Orchestra in New York, and from 1917 to 1919 he was conductor of the French operas at the Metropolitan Opera House. From 1919 to 1924 he was conductor of the Boston Symphony Orchestra. When he assumed the leadership, the once famous orchestra was almost completely demoralized (see *MUSIC, Orchestras*), but he succeeded in bringing the organization back to its former high level of excellence.

MONTFORT, EUGÈNE (1877-). A French novelist. He was the editor of the literary review, *Les Marges*. In his novels he showed a predilection for the sea, particularly for the picturesque Mediterranean and the port of Marseilles. In several of his novels he showed himself a master of description and psychological analysis. His works include: *Les Cœurs Malades* (1904); *Le Châlet dans la Montagne* (1905); *La Maîtresse Américaine* (1906); *La Turquie* (1912); *Les Noces Folles*

(1913); *La Belle Enfant, ou l'Amour à Quarante Ans*; *Mon Brigadier Triboulère* (1918); *Un Cœur Vierge* (1920); *La Soirée Perdue* (1921); *Briolan Marim* (1922).

MONTGOMERY, ROBERT HESTER (1872-). An American lawyer and accountant, born at Mahanoy City, Pa., and educated in the public schools. For many years he was an accountant in New York City. In 1902 he was admitted to the bar. He served as instructor in economics and assistant professor of law at Columbia University from 1912 to 1919, and in the latter year he was appointed professor of accounting there. He served in the Spanish-American War, and during the War in Europe he was attached to the General Staff in Washington. He also served on the War Industries Board and in several other important capacities. He was a member of many legal and economic societies and author of *Income Tax Procedure* (1917-22); *Excess Profits Tax Procedure* (1920); and *Auditing Theory and Practice* (1921).

MOON, PARKER THOMAS (1892-). An American educator, born in New York City, and educated at Columbia University. In 1913-14 he was William Mitchell fellow at Columbia and was Gilder fellow in 1914-15. In the latter year he was appointed instructor in history, and in 1919 assistant professor, at Columbia. In 1921 he became managing editor of the *Political Science Quarterly*. He was a member of the staff of the American Commission to Negotiate Peace in 1918-19. He is a member of several economic societies, and author of *A Syllabus of Imperialism and World Politics* (1919); and *The Labor Problem and the Social Catholic Movement in France* (1921). He also contributed to periodicals and year books.

MOORE, CLARENCE LEMUEL ELISHA (1876-). An American mathematician born in Ross County, Ohio, and educated at Ohio University and Cornell. He was assistant in mathematics at Ohio and held a similar appointment at Cornell. In 1904 he was called to the Massachusetts Institute of Technology, where in 1920 he became professor. Among the subjects in which he has made special investigations are geometry of the sphere, geometry of the circle in space, and the differential geometry of hyperspace.

MOORE, GEORGE EDWARD (1873-). A British philosopher. He was educated at Trinity College at Cambridge and was appointed Lecturer on Moral Science at that university in 1911. He became one of the leaders of the realistic group of philosophers, constituted around the scientific researches of which Cambridge was the centre. His volume on *Principia Ethica* (1903) was an attempt to apply the method of scientific realism to the field of morality and value judgments, but the attempt was only partially successful. Among his other works are a popular exposition of ethical theory (*Ethics*, 1912) and a volume of collected *Philosophical Studies* (1922). In 1920 Professor Moore became the editor of the British philosophical periodical, *Mind*.

MOORE, HARRY TUNIS (1874-). An American bishop, born at Delavan, Wis., and educated at Hobart College and the Western Theological Seminary. In the same year he was ordained priest in the Protestant Episcopal Church and served as rector in several cities of Nebraska, Texas, Illinois, and other States. He

was rector of St. Matthew's Cathedral in Dallas, Texas, 1907-17, and in the latter year was appointed coadjutor bishop of the Diocese of Dallas.

MOORE, HENRY LUDWELL (1869-). An American economist, born in Charles County, Md. He studied at Randolph-Macon College, in Vienna, and at Johns Hopkins University, where during 1896-97 he was instructor of political economy. In 1897 he became professor of political economy at Smith College (Northampton, Mass.). From this position he resigned in 1902 to accept a similar chair at Columbia University. In addition to many articles on the statistical aspects of his specialty, he is the author of *Laos of Wages* (1911); *Economic Cycles, Their Law and Cause* (1914); and *Forecasting the Yield and Price of Cotton* (1917).

MOORE, HENRY THOMAS (1886-). An American psychologist, born at Ansonville, N.C., and educated at Yale and Harvard Universities. He taught at Simmons College and after 1915 at Dartmouth. He is the author of *The Genetic Aspect of Consonance and Dissonance* (1914); *Pain and Pleasure* (1917); and *Modern Psychology for the Beginner* (1922).

MOORE, HUGH KELSEA (1872-). An American chemist, born at Andover, Mass., and educated at the Massachusetts Institute of Technology. He began his professional work as a chemist with the Electro-Chemical Company in Rumford Falls, Me., in 1897. Three years later he became connected with the American Electrolytic Company and with the Burgess Sulphite Fibre Company (1903-10). On the consolidation of several sulphite paper pulp mills as the Brown Company, he became its chief chemical engineer. His original investigations were chiefly concerned with various processes in paper pulp making and its bleaching, on which he obtained many patents. He invented a continuous process for the hydrogenation of oils, and in 1897, the unsubmerged cathode cell. In recognition of "the best contributions to applied science since 1913" he received the gold medal of the American Institute of Chemical Engineers, of which he became a vice president. During the War he was a member of the Council of National Defense and also a member of the division of chemistry of the National Research Council. In addition to many chemical papers he is the author of *The Human Elements in the Mill* (1918) and *Why the Church Fails to Interest People Enough to Attend* (1918).

MOORE, JOHN BASSETT (1860-). An American jurist and diplomat (see VOL. XVI). He served as delegate to the Pan-American Financial Congress in 1915 and was vice president of the International High Commissions organized by that conference. In 1921 he was appointed judge of the Permanent Court of International Justice. His later works on politics and diplomacy included *Principles of American Diplomacy* (1918).

MOORE, JOHN MONROE (1867-). An American bishop, born at Morgantown, Ky., and educated at Lebanon College and Yale and in Germany. He was ordained as a preacher in the Methodist Episcopal Church and filled pastorates in St. Louis, San Antonio, and Dallas, Texas. For several years he was managing editor of *The Christian Advocate* and secretary of home missions of the Methodist Episcopal Church, South, from 1910 to 1918. In the lat-

ter year he was elected bishop and given charge of work in Brazil. He was a member of several important church societies and was the author of *Etchings of the East* (1909); *The South To-day* (1916); *Brazil—An Introductory Study* (1920), and *Essential Objectives in Missionary Endeavor* (1922).

MOORE, RICHARD BISHOP (1871-). An American chemist, born at Cincinnati, Ohio, and educated in England and France and at Chicago University. He was instructor in chemistry at Missouri; and during 1905-11, professor of chemistry at Butler College; and thereafter physicist at the Bureau of Soils of the Department of Agriculture. In 1912 he became connected with the United States Bureau of Mines, whose chief chemist he became in 1919. His original investigations were largely concerned with the properties of rare gases in the atmosphere, and the metallurgy of rare metals, especially tungsten, uranium, and vanadium, and more recently the metallurgy of radium, on which he wrote valuable papers. He is the author of *A Laboratory Chemistry* (1904).

MOORE, UNDERHILL (1879-). An American lawyer and educator, born in New York City, and educated at Columbia University. From 1892 until 1907 he practiced law in New York City. After service on the faculty of the Universities of Kansas and Wisconsin, he was appointed professor of law at Columbia University in 1916. He served in the Spanish-American War. He wrote several books on legal subjects and contributed to the *Columbia Law Review* and other law publications.

MORAND, PAUL (1888-). A French novelist, born in Paris of a French father and a Russian mother, and educated at the Sorbonne. He entered the French diplomatic service and was attached to the embassies at London, Rome, and Madrid. As a man of letters he rose to prominence with his novels, *Ouvert la Nuit* and *Tendres Stocks*, descriptions of cosmopolitan Paris after the War. His other works include *Lampes à Arc*, *Feuilles de Température*, *Fermé la Nuit*, and *Levis et Irene*.

MORAVIA. See CZECHO-SLOVAKIA

MORAVIAN CHURCH, THE (UNITAS FRATRUM). This denomination, tracing its origin to the followers of John Huss and Jerome of Prague, was first organized in Bohemia in 1457. Its members found their way into Pennsylvania in 1740. Its two chief centres in the United States were Bethlehem, Pa., and Winston-Salem, N. C. The denomination had no formal statement of creed peculiar to itself; it is evangelical in belief, in harmony with other Protestants. One explanation of its smallness is that it refrained on principle from seeking proselytes at the expense of other Christian bodies. Its polity was a modified episcopacy; its ritual, liturgical. After the beginning of the War, the administration of the foreign missions was decentralized; the American branch of the church had special responsibility for those in Nicaragua and for the Eskimo and Indian work in Alaska and California. It also rendered aid during the 10 years to other missions of the Moravian Church in Labrador, the West Indies, Dutch Guiana, the Cape Province of South Africa, Tanganyika Territory, and among the Tibetan-speaking peoples of the Western Himalayas and the lepers of Jerusalem. It also supported a college and seminary at Bethlehem, Pa., and several board-

ing schools, throughout the period. In 1913 the communicant membership in the United States and Canada was 19,463; in 1923 it was 23,723. The number of churches increased from 122 to 128; the number of ministers, from 142 to 147. Of these, 33 were either released for temporary service elsewhere or were in partial or complete retirement on account of age or ill health, etc.

MORESNET. See EUPEN, MALMÉDY, AND MORESNET.

MOREY, CHARLES RUFUS (1877-). An American educator and author, born at Hastings, Mich., and educated at the University of Michigan. From 1900 to 1903 he was a fellow of the American School at Rome. In 1903-04 he was a fellow at Princeton University, and in 1906 he became head of the Princeton summer school. He was appointed professor of art and archaeology there in 1918. A member of many learned societies, he was the author of *East Christian Paintings in the Freer Collection* (1914); *Lost Mosaics and Frescoes of Rome* (1915), and *Romanesque Sculpture* (1920).

MORGAN, EDMUND MORRIS, JR. (1878-). An American jurist and educator, born at Mineral Range, Ohio, and educated at Harvard University. In 1905 he began practice in Duluth, Minn., remained there until his appointment as professor of law at the University of Minnesota in 1912. From 1917 he was professor of law at Yale University. He was several times city attorney of Duluth. In the War he served in the judge advocate-general's department with the rank of lieutenant-colonel. He was the author of *Introduction to the Study of Law* (1917) and *Cases of Common Law Pleading*.

MORGAN, JOHN PIERPONT (1867-). An American financier (see VOL. XVI). He took a prominent part in the financial aspects of the War and following its outbreak made the first loan of \$12,000,000 to Russia. His firm was appointed commercial agent of the British government in the United States in 1915 and conducted purchases of all munitions and supplies in the United States. In the same year a loan was made of \$50,000,000 to the French government, and he organized a syndicate of about 2200 banks and floated a loan of \$500,000,000 to the Allies. After the War he was frequently called on to advise the American and foreign governments in financial matters and made several trips to Europe to investigate and report on financial conditions there.

MORGENTHAU, HENRY (1856-). An American diplomat (see VOL. XVI). In 1913 he was appointed ambassador to Turkey and served until 1916. From 1914 he was also in charge of the interests of Great Britain, France, Italy, Russia, Serbia, and other countries in Turkey. In 1919 he was a member of the commission appointed by President Wilson to investigate conditions in Poland. He was appointed ambassador to Mexico in 1920, but owing to the severance of relations between the United States and that country, he did not serve. He was vice president of the Near East Relief from 1919 to 1921. He wrote *Ambassador Morgenthau's Story* (1918) and *All In a Lifetime* (1919). Decorations were conferred on him by various countries for his services during the War.

MORINI, ERIKA (1906-). An Austrian violinist, born in Vienna. She received her first instruction from her father, who was the director of his own music school in Vienna, and

completed her studies under Otakar Sevcik. Hers is a case of remarkable precocity, for when she made her début in Berlin, under Nikisch, in 1917, the critics made no allowance for her youth, but spoke of her work as the equal of that of the most famous of the younger generation of violinists. Her American début at New York (Jan. 26, 1921) was one of the musical sensations of the year, and since then she has been heard in the United States every season, both in recital and with the foremost orchestras. She made her first visit to London in 1923.

MORISON, SAMUEL ELIOT (1887-). An American historian, born in Boston, Mass., and educated at Harvard and in Paris. After serving a year as instructor in history at the University of California, he was instructor and lecturer in history at Harvard from 1915 to 1922, when he became Harold Vyvyan Harmsworth professor of American history at the University of Oxford. He served as a private in the United States Army in the War and was attached to the Russian division of the American Commission to Negotiate Peace in 1919. He was a member of many learned societies and wrote *Life of Harrison Gray Otis* (1913); *History of the Constitution of Massachusetts* (1917), and *Maritime History of Massachusetts* (1921).

MORLEY, CHRISTOPHER (DARLINGTON) (1890-). An American editor and writer, born in Haverford, Pa. He graduated from Haverford College in 1910 and from that year to 1913 was a Rhodes scholar at Oxford. He served on the editorial staff of several publications and journals and from 1920 to 1924 conducted a column in the *New York Evening Post*. In the latter year he joined the staff of the *Saturday Review of Literature*. His books in prose and verse include *The Eighth Sin* (1912); *Songs for a Little House* (1917); *The Rooking Horse* (1919); *Travels in Philadelphia* (1920); *Pipefuls* (1920); *Tales from a Rolltop Desk* (1921); *Chimney-smoke* (1921); *Where the Blue Begins* (1922); *The Powder of Sympathy* (1923); *Inward Ho!* (1923); and *Parson's Pleasure* (1923).

MORLEY OF BLACKBURN (JOHN MORLEY), 1ST VISCOUNT (1838-1923). A British public official and man of letters (see VOL. XVI). From 1910 to 1914 he served as Lord President of the Council but resigned in the latter year after the declaration of war with Germany, which he opposed. He retired to his country home and devoted himself to the writing of a volume of recollections, which was published in 1917. In 1914 he published notes on politics. A complete edition of his works was brought out in 1921.

MORNINGSIDE COLLEGE. An institution at Sioux City, Iowa, founded in 1889. The student enrollment grew steadily from 584 in 1913-14 to 1300 in 1923-24, and the budget increased in the same period from \$60,000 to \$150,000. A chair of religious education, departments of economics and sociology, and a complete course in public school music were established, and additional faculty members attached to several other departments. Three fireproof buildings, Main Hall, a conservatory and a gymnasium, and a temporary science hall were built. An athletic bowl and bleachers was constructed. President, Frank E. Mossman, A.M., D.D.

MOROCCO. The largest of the Barbary states, in northeastern Africa. Since 1912

about 95 per cent of its area has been a French protectorate; the rest, except for the free zone around Tangier (q.v.), was under the protection of Spain. Total area, 231,500 square miles. The Spanish zone included 8280 square miles in the North. However, Spanish claims also took in the 9500 square miles in the Cape Juby region (southern zone) and the 580 square miles of Ifni on the west coast. By 1921 the French had effectively occupied 92,664 square miles. An official French census in 1921 gave the population for the French zone as totaling 5,400,000; urban population, 537,071. Of these, 399,979 were Mussulmans, 65,510 Jewish natives, and 66,875 Europeans (1025 British, 41,028 French, 14,114 Spanish, 9155 Italian). The largest cities in the French zone, with populations for 1921, were: Casablanca, 101,690 (35,283 Europeans); Marakesh, 139,874 (1956 Europeans); Fez, 70,540 (2217 Europeans); Rabat, 30,953 (9226 Europeans); Meknes, 36,592 (2622 Europeans). For the Spanish zone (northern), the population was estimated at 550,000; for Tangiers, at 50,000 (12,000 Europeans). Tetuan, in the Spanish zone, had 30,000 inhabitants. Immigration, which had languished during the War, became considerable again after 1918. In that year, 22,139 immigrants arrived; in 1919, 31,797 (14,929 French); in 1920, 27,797 (14,721 French). See TANGIER CONTROVERSY.

Industry. Agricultural and pastoral pursuits occupied four-fifths of the native population. Of the 25,000,000 acres in the French zone capable of cultivation, only 6,000,000 acres were being tilled. Barley and wheat received the most attention; other crops were beans, oats, maize, and millet. In the regions of Fez, Mequinez, Rabat, and Donkkala, 14,247 acres of vineyards were cultivated by natives; European vineyards covered 3715 acres (1921). Fruit trees, notably the olive, orange, lemon, palm, and almond, were beginning to play an important part. Stocks in 1921 in the French zone comprised 6,733,022 sheep, 2,040,304 goats, 1,517,117 cattle, 115,036 pigs, 420,232 asses, 202,006 horses and mules, 98,252 camels. Minerals included phosphates (80,583 tons exported in 1922), iron ore (115,489 tons exported in 1921 from the Spanish zone), and copper, lead, petroleum, and manganese. In the French zone in 1921 were to be found 268 industrial establishments with 4060 employees and a total invested capital of 173,298,090 francs; the capital invested in 1918 had been only 35,246,000 francs. As a result of European occupation, steady advances were made. The construction of roads, harbors, and sanitary measures were the particular concern of the French. The harbor of Casablanca received particular attention. The Spanish concerned themselves with irrigation projects as well as the expansion of the port facilities of Ceuta and Larash.

Commerce and Communications. The trade of the French zone increased regularly. In 1913 imports and exports had been 181,426,000 francs and 40,180,000 francs; by 1921 they had increased to 909,164,220 and 306,446,857. The 1921 imports originated in the following proportions: France and Algeria, 50 per cent; Algeria (land frontier), 20.7 per cent; United Kingdom, 16 per cent; United States, 9 per cent. The following, in order, received French Morocco's exports: France and Algeria, Spain, the United Kingdom, Italy. Imports from the United States were valued at \$214,460 in 1913

and at \$5,725,000 in 1921. The chief exports in 1921 were barley, eggs, beans, linseed, wool, and almonds. The following indicates the quantity, by quintals, of animal products exported for 1913 and 1920: cowhides, 15,544 and 5065; sheepskins, 18,730 and 12,878; goatskins, 16,815 and 18,407; wool, 38,897 and 15,633; eggs, 23,465 and 42,240; wax, 1141 and 1586. That the increase in trade was real, in spite of the inflation of the franc, may be seen by the fact that 2,921,000 tons of shipping entered French Moroccan ports in 1912 and 4,516,592 tons in 1921. The trade of the Spanish zone was as follows: imports and exports for 1913 were 25,335,000 and 2,876,000 pesetas; for 1921, 72,552,340 and 6,431,000 pesetas. The trade for Tangier was as follows: imports and exports for 1913 were 24,455,000 and 3,408,000 francs; for 1921, 59,379,252 and 4,522,460. Under the French administration, road building went on rapidly so that by 1922 2590 miles were open for use. As part of the same general plan for the opening up of the protectorate, military lines of 2 foot gauge were converted into standard gauge lines. There were 820 miles of such roads in 1922. The principal lines were the Fez-Oudja (223 miles), Fez-Casablanca (210 miles), Casablanca-Marrakesh (171 miles). In the Spanish zone a meter gauge line ran from Ceuta to Tetuan, and another from Rio Martin to Tetuan. Telephone and telegraph communications were widely extended, and wireless stations were erected at Fez, Marrakesh, Mogador, Tangier.

Government. In the French zone, as a result of increased activity, administrative costs mounted steadily. Expenditures in 1916-17 were 45,389,000 francs; in 1922, 261,171,495. Revenues continued in excess during the whole period with the result that the debt service carried annually was conspicuous. Of the 1922 budget, 44,730,154 francs were applied to the public debt, which in that year totaled 705,624,000 francs, of which 300,000,000 francs had been floated in 1922 as the first section of an authorized loan of 700,000,000 francs. The scheme encompassed a great series of public works, including the development of harbors, roads, water power resources, phosphate works, posts, telegraphs and telephones, health service, forestry, public instruction, etc. The budget for the Spanish zone in 1922-23 balanced at 17,097,268 pesetas. Education, under the foreign influence, made great advances. In 1912, the French zone had only 37 schools; by 1921, it had 192 with 25,159 pupils in attendance.

History. The partial withdrawal of French troops on the outbreak of the War, and the ever-present anti-European feeling which German agitators continually fostered, aggravated the unruliness long chronic in Morocco. As the War continued, French occupation was extended; the Tafilalet region was subdued by 1917, and an uprising of the Ait Atta there was put down, after desultory fighting, by 1919. France's policy of continuing public works and of befriending native chieftains stood her in good stead, for many of the powerful native leaders remained consistently friendly. In 1919 and 1920, as a result of trouble in the Sifru region and the Gharb, the French were able to push further into the interior, so that by 1923 most of the country, with the exception of the Middle Atlas, was effectively occupied. An exceptionally able administrator, Marshal Lyautey, occupied the post of President-General during the whole

period; and under his energetic direction remarkable progress was made in sanitation, road construction, railway-building, and education.

The Spanish problem in Morocco was less easily solved. Because of the tardy development of the Spanish zone and the difficulties of communication, the native independent temper was less easy of subjugation. Brigandage continued the rule, the Rif and Jebala tribes were particular offenders. Most of the dissident spirits gathered around Raisuli, one of the important chieftains. From 1916 to 1919 all attempts to eject him from the Tangier-Tetuan road which he held were unavailing; when he finally evacuated the country he merely moved to another centre of operations. The upshot was that by 1920 the Spanish were abandoning one interior post after another. In 1921, the fighting broke out with greater fierceness. Under the Rif attacks, Spanish forces lost Nador, Zeluan. Mt. A-rut, Sheshuan, Tefer, and even Penon de Valez, an island east of Ceuta. In September and October of the same year, strong Spanish forces carried the war into the Rif country and after many engagements retook Nador and Zeluan and cleaned out the heights around Melilla. Desultory fighting continued throughout 1922. That the country was not pacified and could not be so long as the inefficient Spanish military juntas continued to exert a preponderant influence in Morocco, was indicated when the Rif tribes once more took up arms in 1923 and occupied the Tetuan-Sheshuan line. The action indicated how universal disaffection was, for it followed the pledge of loyalty given the Spanish occupation by Raisuli, about whom, heretofore, most of the rebellious forces had gathered. The influence of this succession of reverses on the local situation was momentous. (See SPAIN.) In July, 1922, the Spanish High Commissioner-General, Berenguer, was forced to resign; his successor, Gen. Ricardo Burguete, found it necessary to retire in December; and in September, 1923, because of the unsatisfactory handling of the whole situation, the Spanish government was seized in a coup d'état and a military dictatorship under General Rivera was created. In spite of the lofty pretensions of the Directorate, Morocco remained unconquerable, the continued impertinences of the tribesmen only revealing the impotence of Spain the more clearly. Rivera had announced in the beginning his intention to accomplish the extrication of his country from her Moroccan entanglement. But no party favored such a move, and it was doubtful whether Rivera could take the step even if he would. The result was repeated Rif victories. In 1924 engagements were reported in which a Spanish Foreign Legion column was lost, several Spanish airplanes brought down, and a Spanish cruiser openly shelled. Early in 1924, 80,000 tribesmen were marching on Melilla; among the Spanish troops gathered to oppose them, a mutinous spirit was plainly visible. To July, 1923, the cost of pacification since 1909 was put at 2,494,000,000 pesetas, and the end, evidently, was not yet in sight. For the Tangier controversy, see TANGIER. See also SPAIN and WAR IN EUROPE.

MORRIS, JAMES CRAIK (1870-). An American bishop, born at Louisville, Ky., and educated at the University of the South, the Louisville Law School, and the General Theological Seminary. He became a priest in the

Protestant Episcopal Church in 1896 and was the curate of churches in Texas and New York. From 1901 to 1916 he was dean of St. Mary's Cathedral in Memphis, Tenn., and from 1916 to 1919, rector of Grace Church in Madison, Wis. In 1920 he was consecrated bishop of the Panama Canal zone and parts adjacent.

MORRIS, ROBERT TUTTLE (1857-). An American surgeon, born in Seymour, Conn., and educated at Columbia University. He settled at first in Albany. After removing to New York, he became a professor of surgery at the New York Post-graduate Medical School in 1895. He is the author of many books, including *How We Treat Wounds To-day* (1886); *Lectures on Appendicitis* (1895); *Dawn of the Fourth Era of Surgery* (1910); *Microbes and Men* (1918); *A Surgeon's Philosophy* (1918); *Doctors vs. Folks* (1918); *The Way Out of the War* (1918); *Nut-growing* (1921). As the titles imply, some of these books are semipopular and others non-medical in scope.

MORROW, DWIGHT WHITNEY (1873-). An American lawyer, born at Huntington, W. Va., and educated at Amherst College and Columbia Law School. In 1899 he began the practice of law in New York City as a member of the firm of Simpson, Thatcher, and Bartlett. In 1914 he became a member of the firm of J. P. Morgan and Company. He took an active part in civic matters in New York City and in New Jersey. He was director of the War Savings Committee of New Jersey (1918). During the War he served with the Military Board of Allied Supply and received the Distinguished Service Medal.

MORTAR, TRENCH. See TRENCH WARFARE MATERIAL.

MOSELEY, GEORGE VAN HORN (1874-). An American soldier, born in Evanston, Ill. He graduated from the United States Military Academy in 1889 and was commissioned 2d lieutenant in the cavalry in the same year. He rose to the rank of major in 1916 and in 1917 was appointed colonel in the National Army, with the command of the 5th Field Artillery. He was appointed chief of the 4th Section of the General Staff at General Headquarters in 1918 and had general charge of the strategic supply, transportation, construction, and evacuation of the American Army in France. He was a member of several important commissions, including the Harbord Commission to the Near East, where, after commanding the 2d Field Artillery Brigade, he was assigned as assistant to General Dawes in 1921. He was awarded the Distinguished Service Medal and was given decorations by the Belgian, British, French, and Italian Governments.

MOSUL. See MESOPATAMIA.

MOTHERS' PENSIONS. "Mothers' pension" laws, or laws providing for public aid to dependent children in their own homes, are intended to conserve family life by preventing the break-up of homes after the death, desertion, or disability of the father. The first State-wide mothers' aid law was passed in 1911, two years after the White House Conference on the Care of Dependent Children, called by President Roosevelt, had declared as its fundamental proposition that children should not be deprived of home care except for urgent and compelling reasons, and that "children of parents of worthy character . . . and children of reasonably efficient and deserving mothers who are without

support of the normal breadwinner, should, as a rule, be kept with their parents, such aid being given as may be necessary to maintain suitable homes for the rearing of children." The "mothers' pension" movement became an effective answer to the arguments of opponents of child labor legislation that children of widowed mothers would be helpless if they were not permitted to work. By the close of 1913, 19 States had State-wide mothers' pension or aid-to-mothers laws, and Missouri had provided for such aid in Kansas City and St. Louis. By 1924 such laws were in effect in 42 States, Alaska, and Hawaii.

At first the aid was usually limited to widows, but the conception of this method of provision for children has gradually widened, until by 1924 only four States of the 42 in which laws were in operation limited the grant to children of widows, though all the States included widows directly or by implication. The Colorado act included a parent, or other person designated by the court, who because of poverty was unable to provide properly for a dependent child. Children of widowed or deserted mothers, and of mothers whose husbands were serving penitentiary sentences or were physically or mentally incapacitated, were commonly included. The ages under which children were eligible for aid ranged from 14 to 17 years and one State (Ohio) mentioned no age limit; in many States the upper age limit had been made to correspond with the upper age limit of the child labor law, so that aid might be continued until the child was legally permitted to go to work. In the majority of States maximum amounts were specified, ranging from \$8.66 to \$35 a month for one child, with additional amounts (usually smaller) for each additional child. Frequently the maximum amount for a family of any size was specified in sums ranging from \$40 to \$60, but in many States there was no such limitation. The amount of aid granted to each family can be adjusted to the actual needs of the family only if the maximum amount authorized by law is sufficiently high or if no limit is specified. The administration of the aid-to-mothers law was vested either in a court having juvenile jurisdiction, a county or town board granting poor relief, a county board of public welfare, a special county board, or a State board. There was some form of State supervision in 23 States in addition to those in which definite administrative authority was lodged in a State board.

Survivors' insurance under governmental auspices, providing pensions for both widows and orphans, existed in Germany, France, Holland, and Austria, by 1924. In Great Britain, in that year, a measure to establish a mothers' pension system was in preparation. Canada, Denmark, and New Zealand also had made public provision for mothers with young children to support.

MOTOR SHIP. See SHIPBUILDING AND NAVAL ARCHITECTURE; SHIPPING.

MOTOR VEHICLES. Despite the marked advances in the design and production of all forms of motor vehicles during the decade 1914-24, it is believed by those familiar with automotive engineering that so far as designs are concerned there is still room for improvement. The most apparent improvement was in simplifying

and strengthening the mechanism so that cars of all types were reliable in action and capable of running thousands of miles without mechanical failure and of serving their owners for two or three years without overhauling and with only the most cursory repairs and attention. Of the three well-known forms of motive power, steam, electricity, and the internal-combustion motor, the last reigned almost supreme; by far the greatest number of motor vehicles in use depended on it for propulsive power.

Electric Automobile. Electric automobiles were still used in fair numbers. Storage batteries were increased in capacity without a proportionate increase in weight, by more careful design and construction, and were installed, especially on vehicles intended for commercial use, in shock-insulated containers which were readily accessible for examination and easily changed for fully charged batteries as replacements. This was valuable in cases where it was not always possible to lay up the vehicle for the time necessary to recharge the battery if exhausted in service.

Gas-electric Trucks. Combination gas-electric trucks have been designed and put to practical use. In these, an internal-combustion motor drives a generator, which in turn keeps a charge of electricity in the battery. The wheels are driven by electric motors; in some cases, there is a separate motor in each rear wheel. In special applications, such as fire apparatus of the heavier types, there may be a motor in each of the front wheels and none in the rear. There are other forms which have a driving motor in each of the four wheels, all of which may be moved at an angle from the normal direction of vehicle movement to make steering easier. There is still another system in which a small engine is operated at constant speed while the vehicle is in motion, regardless of the vehicle speed, the generator supplies current to a driving motor, and the storage battery, which is smaller than that ordinarily used in an electric automobile, is "floated on the line" so that it absorbs excess current when power requirements are less than that supplied by the engine-generator combination, and it gives out electricity to the power motor when conditions of road or gradient are such that more than the normal energy output is required. Such combinations are cumbersome and relatively inefficient and have not won much recognition.

In order to increase the cruising radius per charge, some makers of electric vehicles use as motive power a motor which can be turned into a generator by a simple control lever movement when coasting down hills; advantage can be taken of the conversion of mechanical power due to vehicle momentum produced by gravity into electrical energy which is "stored" in the storage battery of the vehicle. Tests made by competent drivers have shown an increase per charge in cruising radius of from 10 to 15 per cent when the driving motor may be used as a dynamo under favorable conditions.

Trackless Trolleys. Still another form of motor vehicle using electric motors for power is a hybrid between the usual form of electric rail car and the self-propelled motor vehicle; it is built just like an electric automobile as far as chassis and body construction go, as well as in the placing of the driving motor and the character of control and power transmission ele-

ments. No storage battery is provided in some cases, but a trolley pole taking current from a pair of conductors overhead is used. In other forms, a battery of limited capacity is supplied to take care of cross-overs or to permit the vehicle to change from one line to another at points where the current conveying conductors themselves do not change. Owing to the use of rubber tires, these trackless trolleys, as such vehicles are called, cannot use rails as a return; so the current must enter the vehicle circuit by one trolley wheel, and after it has done its work, it passes back into the return conductor of the line through the trolley wheel which is electrically insulated from the other. The overhead conductors must also be carefully separated from each other. The vehicle is steered from one side of the road to the other just as the more conventional automobile is and it can thus pass around slower traffic that might retard a car running on rails. The expense of operation is reduced over the form needing rails to run on because no roadbed need be provided other than the highway used by all vehicular traffic.

Steam Automobiles. Steam automobiles are rapidly decreasing in number in the United States, where their application in the past has been mostly for passenger use; but they are still used to some extent in England for commercial purposes. Several marked improvements have been made in steam automobiles and some of the objections formerly advanced against them are no longer tenable. One of these was the frequent refilling of the water-supply tank, which in the case of the earlier Stanley steamers was necessary every 25 or 30 miles. This was because the steam was exhausted directly into the air after it had passed through the engine. The modern steam automobile exhausts the steam into a condenser mounted at the front of the chassis just as the radiator or water cooler is in vehicles propelled by internal-combustion motors. The steam condenses, and the cylinder oil is separated from it; the resulting water obtained by cooling the steam is pumped back into the tank and used again as boiler-feed water. The cruising radius on one tank of water is increased from 6 to 10 times what would be possible without the condenser.

The other big improvement has been the use of the Dohle combustion system, in which the usual form of Bunsen or Argand burner flame or "fire" is replaced by a more intense blow torch or blast flame, which burns in a closed combustion chamber, under the boiler, lined with refractory material. This reduces the fire risk incidental to the use of the older form of Bunsen burner. Not only is a hotter fire obtained, but it is more easily started. The older form of burner was started from a "pilot" or small auxiliary burner which was started initially by preheating with a plumber's blow torch. It took 15 to 20 minutes to start the generation of steam with the fire-tube boiler and old burner combination before enough steam had been generated to supply the engine. In the new combustion system, an electrically driven air blower supplies the blast and vaporizes the fuel sprayed into the air stream thoroughly. So completely are the two mixed that the resulting vapor may be ignited almost instantaneously by an electric spark plug such as used in internal-combustion motors; as a flash boiler is used, steam generation starts almost as soon as the combustion chamber is filled with burning gas. A generator driven from the

steam engine while the vehicle is in motion keeps the storage battery charged. The battery supplies the blower motor with current and furnishes the igniting spark for the electric "pilot" and current for the usual complement of lamps used in night driving. The engine used in either case is the simple, two-cylinder double-acting type, directly geared to the rear-axle differential-drive gear. Much better results are obtained with kerosene or fuel oil in the blast combustion system, and the burner cannot clog so easily as when a Bunsen burner is used with fuels of other than high volatility, when imperfect combustion causes carbonization of the numerous fine fuel vapor spray orifices.

Internal-combustion Motors. The most notable change between 1914 and 1924 in automobiles utilizing internal-combustion motors for propulsion was in the power plant. No passenger automobile worthy of the name is built with less than four cylinders, and while the majority of motorists use four-cylinder cars because these are produced in such large quantities, the six-cylinder type is also very popular and is favored by most builders of passenger cars. Eight-cylinder engines are used to a limited extent, the V-type being favored in some quarters and the eight-in-line or straight-eight by other makers. There is no "best" type; each fills a real demand. For the low- and medium-priced car and commercial vehicles, it will be difficult to replace the economical, simple, and easy-to-maintain four-cylinder engine. For 1924, 120 chassis models of passenger cars were produced by 95 manufacturers. About 70 per cent of these were equipped with six-cylinder engines; this form is thus favored by most designers. The four-cylinder type, which is used on about 80 per cent of the automobiles manufactured, was found on about 20 per cent of the models, while the eight-cylinder was used on only 10 per cent of the models. Racing engines have demonstrated that by the use of more costly construction, such as a counterbalanced crankshaft, a four-cylinder may be run with very little vibration. The increase in cost might be just as well employed in building six-cylinder engines as in improving the four-cylinder, because no four-cylinder can give the overlapping explosions or power impulses of the six-cylinder engine. This explains why designers favor the six-cylinder form. Designers of "luxury" cars provide eight-cylinder engines, because the power impulses occur with such frequency that an almost continuous power application to the driving wheels is secured, and the resulting smooth action is reflected in the riding qualities.

The efforts of designers of internal-combustion motors for vehicle use seem to have had two main objectives; first, to secure maximum efficiency; secondly, to secure quiet operation and freedom from vibration. As a quiet engine is usually efficient, improvements in engine construction to attain one object often effect the other. The automobile engine of 1924 differed from that of 1914 in numerous respects. It was smaller; that is, its cubic capacity was less; yet the power developed was greater. Higher compression pressures are used, which mean greater power to the explosion. Marked improvements in lubrication systems, lighter reciprocating and rotating parts, and improved materials permit of higher speeds. Of valve materials available, a silicon-chromium steel alloy will withstand a white heat repeatedly and also repeated cooling

VIEWS OF HAYNES SIX-CYLINDER UNIT POWER PLANT

without warping or scaling. Aluminum alloy pistons of the split skirt type may be as closely fitted to the cylinders as cast-iron pistons weighing two or three times as much; with no loss of reliability or endurance, they permit the engine to run at much higher speeds because the inertia forces are reduced. Connecting-rods are being made of duralumin, an aluminum-magnesium alloy which has the strength of steel and may be heat-treated after forging, as steel is and yet weighs only one-third as much. Pressure-feed oiling systems are generally used, even on low- and moderate-priced cars. Systems of this type have positive oil supply to the various main bearings, and passages drilled in the crankshaft supply the connecting-rod big ends. As the pressure produced by the positive acting mechanical pump may run as high as 80 or 90 pounds per square inch, it will be evident that an oil film may be maintained on all important bearings even at high engine speeds.

Improved Fuel. Not only the physicist and mechanical engineer are concerned with improving engine efficiency; the chemist has also helped.

A large and prominent company, the General Motors Corporation, has developed in its research laboratories a treatment for gasoline that will permit engineers to obtain double the mileage possible with untreated fuel. In brief, it was determined that the knocking noticed in the average engine when climbing a hill with gas throttle wide open could be eliminated by adding about one-tenth of 1 per cent by volume of a liquid called tetra-ethyl-lead to the gasoline. While such a discovery increases the efficiency of the present types of engine and adds to the comfort of the driver, its greatest importance lies in the fact that engines can be built in the future to use this fuel with twice the amount of compression of present-day engines. When this is done, without any decrease in engine dimensions or sacrifice of speed and hill-climbing power, twice the present mileage per gallon of fuel will be obtained.

Even in engines of the eight-cylinder type, every care is taken to secure balanced operation. In the 1924 Packard, a type of crankshaft is used marking a departure from usual straight-

eight practice Four crankpin throws, two at each end of the shaft, are set at right angles to the centre four throws. This makes possible an interlocking firing order which cancels both the primary and secondary forces and eliminates vibration completely. The secondary unbalanced forces are completely neutralized or "cancelled out" because in any engine employing reciprocating and rotating masses in balance at all times, no vibration will be transmitted throughout the car at certain critical engine speeds. Inherent balance is secured in the Cadillac V-type, eight-cylinder engine by a new arrangement of the crank throws, and compensators or counterweights are added. The four cranks are in two planes at right angles to each other, instead of in one plane as in previous V-eight practice. This type of engine, which is really a twin four, —formerly used a short, compact crankshaft similar to that employed in a four-cylinder engine. The new arrangement may be easily understood; if the crankpin at the forward end of the shaft be considered to correspond with the figure XII on the clock dial, the second crankpin would fall at III, the third crankpin at IX, and the fourth pin at VI.

Engine Refinements. Having greatly reduced vibration by lightening and balancing reciprocating as well as rotating parts, the next effect to secure is quiet engine operation. The thorough enclosure of all working parts formerly left in the open, as valve springs and valve lifting tappets or push rods and rocker arms, has made it possible to lubricate these parts and reduce noise by the reduction of mechanical depreciation and resulting lost motion or rattle, as well as by the deadening effect enclosure has on minor sounds. Sleeve valve motors of the Knight design are much more extensively used both in Europe and the United States than formerly, and of course the sliding sleeves work without the clatter found in poppet valve engines after they have been used for a time. The valve operating camshaft drive has also been improved. Where a gear train is used, the gears have angularly placed teeth, and one or more gears of the train are made of some sound-absorbing material, such as treated, compressed cotton or phenol condensite. A very popular method of driving the camshaft and auxiliaries is by silent chains of the link-belt form; automatic tightening devices are provided to take care of the stretching of the chains in service.

Ignition Systems. Ignition systems have been greatly improved, and nearly all passenger cars use a single coil-distributor battery system. Air-cooling is also receiving practical application; the leading exponent of this form of engine for automobiles, the Franklin Company, developed a type of engine in which a blower rotor member on the crankshaft supplies an air blast through jackets which confine it to the cylinder walls and other parts to cool the engine directly, without the use of water as an intermediary heat-absorbing medium. Such a cooling system is independent of climate, as it cannot freeze at extremely low temperatures or boil away at high temperatures.

Starting and Lighting Systems. The electric starting and lighting systems have been simplified and are now practically meddle-proof. The Bendix drive or automatically engaging drive pinion has greatly simplified the mechanism necessary to put the engine in motion.

GENERATOR AND STARTING MOTOR USED ON SOME MODELS OF CHEVROLET AUTOMOBILES

The upper figure shows the generator which has important components of ignition system, such as induction coil and timer distributor, mounted thereon. Below is the starting motor, having the Bendix automatic starting pinion shift. When the motor is started by the switch, the armature rotation automatically engages pinion with gear teeth cut on flywheel.

There is no need of shifting gears or clutches in the modern starting system. A pressure of the foot on the starting switch button or pedal starts the electric motor turning. A pinion having a spiral thread cut in its bore is mounted on the motor armature shaft so that the rotation of that member causes the pinion or small gear to move laterally as well as to rotate until it meshes with and turns the flywheel, which has corresponding teeth cut around its outer periphery. Sufficient reduction is secured so that the electric motor rotates the crankshaft of the automobile power plant and starts the engine on its cycle of operations. As soon as the engine starts, the electric motor is disconnected from the battery and the pinion automatically moves on the spirally threaded armature shaft until it is out of engagement with the flywheel.

Generators. The generator has also been greatly simplified. The most popular forms employ the third brush system of current output regulation instead of the centrifugal governors, slip clutches, separate resistances, etc., of the older systems. A simple form of automatic current cut-out prevents the battery from discharging back through the generator when it is not turning fast enough to generate charging current. The single wire system is also a step forward in simplifying the layout. Instead of using two wires for each circuit, only one insulated wire is used, the metal frame of the car is used for a return or ground, and one

pole of each appliance, such as lamp bulbs, horn, etc. is grounded to the frame or some metal part in good electrical contact with it. The wire is carried in a metal sheath to prevent chafing the insulation, and every precaution is taken to make all connections in such a way that no trouble will be experienced. Such a system is known as a two-unit system when separate starting motors and generators are used, but the Delco one-unit system is also deservedly popular. In this, a single motor-generator suffices. Two commutators are provided on the armature shaft, one of these is used when the machine is used as a starting motor, and the other commutator and set of brushes come into action automatically when the engine has started and is running fast enough to turn the armature shaft by an automatic driving clutch.

Carburetors. There was considerable change, during the period 1914-24, in the form of carburetor; and devices using automatic air valves,

which were formerly very popular, were used less than the compensating jet type as exemplified in the Zenith carburetor. The automatic air-valve type was apt to be noisy on account of "fluttering" of the valve, and the moving parts sometimes gave trouble by premature wearing or loss of adjustment. There are no rapidly moving parts in modern carburetors, only the float feed control mechanism, which is very simple and not apt to get out of order. The Zenith carburetor has two jets, one inside the other, projecting into the venturi of a plain-tube mixing chamber. No adjustment is provided at the spray nozzles, and by utilizing an ingenious hydraulic-pneumatic principle, compensation is provided automatically, as the throttle is opened and mixture proportions best suited for various operating conditions provided. Another popular carburetor is known as the metering-pin type. In this, an automatic air valve carries a needle or pin which regulates the opening of the spray nozzle; as more air is admitted to the mixture by the lift of the valve, the metering pin also lifts and permits an increased flow of liquid fuel. A very practical modern device is

THE ZENITH CARBURETOR
This fuel vaporizing device gives automatic mixture compensation without air valves.

Packard Fuelizer applied to twin-six engine provides warm fog or vapor to mixture so as to make easier starting of engine in cold weather.

the "fuelizer" in its various forms. This makes starting easy at low temperatures when vaporization of fuel by ordinary methods would be

difficult. The Packard fuelizer, which may be considered representative of devices of this character, consists of a chamber which is an auxiliary to the carburetor in which the vapor may be ignited by an electric spark passing between the electrodes of a spark plug. The combustion is not complete, because the air supply is limited; but a warm fog is produced which heats the rest of the mixture so that it ignites readily in the engine cylinders even in zero weather. Another carburetor auxiliary is an air filter or cleaner. Chemical analysis has disclosed that the carbon deposit in the combustion chambers of automobile engines is composed largely of road dust sucked in on the aspiration stroke through the carburetor. Various forms of filters and separators are provided through which all air passing into the carburetor must first go in order to cleanse it of dust particles. Considerable depreciation of engine parts has also been attributed to the abrading action of the non-combustible mineral matter drawn into the engine with the fuel mixture. The simplest and most compact device operates on the centrifugal separator principle. A rapidly revolving fan wheel throws the dust particles aside as the entering air-stream passes through the device and clean air enters the engine.

Fuel Supply. The gravity feed of fuel to the carburetor has been perfected by the use of a small auxiliary container known as a "vacuum" tank which draws its supply of fuel from the main tank, which may be placed at any desired point on the chassis, by utilizing engine

TYPICAL MODERN FUEL SUPPLY SYSTEM
A vacuum tank is interposed between main fuel container and carbureting device.

suction. Its mechanism is so simple and its action so positive that most of the automobiles built at the present time have this method of fuel supply incorporated in their construction. The suction chamber is connected to the intake manifold of the engine by a short tube and with the fuel tank at the rear of the chassis by a length of tubing. A simple float mechanism is used to shut off the fuel flow when the float chamber is full. This trips a lever carrying two valves, one of them shutting off the suction pipe, the other opening an air-valve which admits air from outside. A flap valve opens at the bottom of the float chamber and permits the fuel to flow into the supply chamber connected with the carburetor by suitable piping. When the upper chamber empties itself, the float falls, and the suction valve unseats to let the engine create a partial vacuum in the float chamber. The pressure of the air on the liquid fuel in the main tank raises it to the auxiliary tank in the engine compartment. Pressure feed by engine-driven air pump and auxiliary hand-operated air pump is found only on a few high-priced cars. Very little use is made of the cowl tank or the

method of securing gravity feed by placing the tank under the front seat. The Ford car is the

THE STEWART VACUUM TANK

Almost universally used as a means of fuel supply, is placed near the carburetor, which it supplies. It draws gasoline from a tank at rear of chassis.

- A—Suction valve for opening and closing the connection to engine intake manifold
- B—Atmospheric valve permitting or preventing an atmospheric pressure condition in upper chamber.
- C—Pipe connecting tank to engine intake manifold.
- D—Pipe connecting vacuum tank to main gasoline supply tank.
- E—Lever to which two coil springs S are attached. This lever is operated by movement of the float G.
- F—Short lever operated by the lever E and in turn operating valves A and B.
- G—Float.
- H—Flapper valve in the outlet T, closed by suction whenever the valve A is open, but opening when the float valve has closed suction valve A and opened atmospheric valve B.
- K—Line to carburetor extended on inside of tank to form pocket for trapping water and sediment.
- L—Channel space between inner and outer shells connecting with air vent R.
- R—Air vent over atmospheric valve for preventing an overflow of gasoline in case the position of vehicle should ever be such as to raise the gasoline supply tank higher than the vacuum tank.
- T—Outlet at bottom of float reservoir, in which is the flapper valve H.
- W—Plug for temporary removal while driving to service station in case of trouble due to leaky float and for giving access to tank for wetting valves with gasoline when dry and for washing dirt or sediment from flapper valve H.
- U—Guide for stem of float G.

only passenger automobile using the latter location. The Overland uses a cowl tank. Some motor trucks of the speed wagon type have the fuel tank carried on the dash or bulkhead separating the engine from the driver's compartment.

Formerly, several types of clutches received almost equal application; the cone clutch was very popular, and the multiple-disc clutch ran it a close second. Single-plate clutches were in

the minority. In 1924, on the basis of the number of models of cars produced rather than the number of any one model in use as a gauge of popularity, the cone clutch was used on only 3 per cent of the models, the multiple-disc clutch on 43 per cent, and the single plate clutch on 54 per cent. The all-metal plate clutch was seldom used; designers favoring the multiple-disc system used plates faced with Raybestos friction material, alternately with metal plates. The most popular single-plate clutch design has a driven member of cast iron engaging "floating" discs or rings of woven asbestos friction material interposed between it and the two driving faces, also of cast iron.

Gearsets. Considering change speed gearing, practically all passenger cars with the exception of the Ford employ the sliding gear system. The conventional gearbox operates on the selective principle, which means that it is possible to engage any desired set of gears directly from neutral without first passing through lower ratios, as was necessary with the progres-

sive system. The flexible control possible with the modern engine, even the four-cylinder form, has made the use of more than three forward speeds and one reverse unnecessary except on the heavy passenger cars and commercial vehicles which use four speed gearsets. In fact, several motor trucks are equipped with "two range" gearsets. By the use of two sets of constant mesh gears between main and counter shafts, either of which may be used at will, it is possible to have a high speed range for all favorable conditions and a low speed range when loads are heavy or roads are poor. By this construction it is possible to convert the usual three-speed selective gearset into one giving six forward speeds and two reverse. Numerous motor-

truck designers now provide what is known as a "power take-off" on the gearset, this being a short shaft driven by the gearing so that engine power may be delivered to a screw hoist mechanism to operate a dump body or to a winch or windlass carried by the chassis for hoisting. Some passenger car gearsets have a power take-off, so that an engine-driven tire pump may be attached to the gearset. The 1914 disharmony of opinion regarding gearbox placing resolved to that form of unit power plant in which the change speed gears are mounted in a case forming an extension of the clutch housing member which is bolted to the engine. All parts are thus maintained in line and the alignment cannot be influenced by chassis frame deflection or distortion. The unit power plant construction was found in 1924 on 85 per cent of passenger cars and most trucks not of long wheelbase. The amidship location was found on only 13 per cent of passenger-car models. Whereas 20 per cent of 1912 models had the gearset attached to the rear axle, in 1924 only one make of car used this construction. One make had the gearbox mounted at the front end of the torque tube.

The full-floating axle was found in 1914 on more than 60 per cent of the models, but it lost ground steadily, and in 1924 was used on only 16 per cent. The semi-floating axle, which was considered suitable only for cheap and light cars in 1914, and as a result of this belief was found on only 20 per cent of the models, gained ground and occupied the same position in 1924 that the full-floating type did 10 years previously, as it had come to be used on 60 per cent of the models. Improvements in axle steels and housing construction, as well as the use of a smaller number of bearings and simpler construction, all contributed to the popularity of the semi-floating design. In an endeavor to combine the good features of both semi-floating and full-floating types, an intermediate design known as the three-quarter floating was evolved and was found on about 20 per cent of the models. Practically all axles used in passenger-car construction were of the bevel gear drive type, but straight-tooth bevels were found only on the Ford; all other automobiles were driven by spiral bevel gears because of their greater quietness. Worm-drive axles were found only on electric passenger cars but were very popular in motor-truck construction. The bevel pinion type of differential mechanism is universally used, and while various forms of positive differentials were devised in an attempt to prevent loss of traction of the wheel that has the poorest adhesion to the ground, few of these were applied as standard equipment except in motor trucks.

Brakes. Two of the most discussed innovations in the 1924 automobiles were four-wheel brakes and balloon tires. There is no question but that four-wheel brakes have many advantages, but there is also much to be said against them. Some makers furnished them as standard equipment; others supplied them optionally. The principle of operation of front-wheel brakes is the same as that of the members on the rear wheels, and no argument is possible against any motor vehicle's stopping quicker if all four wheels are retarded than if only the traction members are stopped. Provision must be made, however, to prevent locking of the front wheels

TYPICAL THREE FORWARD-SPEED AND ONE REVERSE SELECTIVE SLIDING GEARSET

sive system. The flexible control possible with the modern engine, even the four-cylinder form, has made the use of more than three forward speeds and one reverse unnecessary except on the heavy passenger cars and commercial vehicles which use four speed gearsets. In fact, several motor trucks are equipped with "two range" gearsets. By the use of two sets of constant mesh gears between main and counter shafts, either of which may be used at will, it is possible to have a high speed range for all favorable conditions and a low speed range when loads are heavy or roads are poor. By this construction it is possible to convert the usual three-speed selective gearset into one giving six forward speeds and two reverse. Numerous motor-

when the brakes are applied, on account of the danger which attends the stopping of a rapidly moving vehicle when the front wheels are displaced by the steering mechanism in rounding curves. As long as the ability to steer a car depends on the rolling motion of the front wheels, stopping this must make the car more difficult to control. The wear on the brakes will be less when four are used to stop the car than when only two are employed. It is stated that half the pressure of the foot on the brake pedal will stop the car in the same distance as with two wheel brakes and that the same exertion will stop it in half the distance. Engineers who favor four-wheel brakes do not all agree on the type of brake or on the method of operation. Some favor internal expanding bands or spreading shoes; others favor external constricting bands. While in most cars the brakes are actuated by mechanical linkage and equalizers, some makes have hydraulic operation. In the last-named system a master cylinder is mounted on the transmission case; the brake pedal is attached to a piston rod which forces oil out of the cylinder through pipes running to the brake and operating cylinders at the wheels. This method provides for compensation or equalization to make sure that all brakes are applied equally without mechanical linkage. To show how rapidly four-wheel brakes were gaining in favor: in 1923 only one American model furnished them as standard equipment, 20 per cent of the models had the emergency brake on the drive shaft and service brakes on the rear wheels, and 76 per cent had both sets of brakes on the rear wheels only. In 1924 about 14 per cent of the models had four-wheel brakes as standard equipment, 29 per cent had one of the braking effects on the drive shaft, and 57 per cent of the models had both brakes acting on the rear wheels. Nearly 20 per cent of the models have four-wheel brakes optional at extra cost.

Tires. No discussion of recent features of motor vehicles would be complete without brief mention of low-pressure, oversize, light-walled tires known as "balloon" tires. The essential feature is the cushioning effect obtained from a low-pressure tire on rough roads. Of equal im-

portance with the increased comfort to passengers is the effect on the mechanism and the car body. So far, no way has presented itself of making deliberate comparisons between high-pressure and low-pressure tires in preventing a

car from developing rattles, creaks, and mechanical depreciation, because balloon tires are of such recent derivation. In 1924 there were three types of balloon tires ranging from oversize cords through semiballoon tires intended to fit the same rims as for high-pressure tires to the true balloon tires, which have great width and which require special small-diameter wheels and wider rims. That a marked improvement in riding comfort will be obtained from a tire having an internal pressure of 30 pounds over one carrying the same load on a lesser volume of air at 70 to 80 pounds' pressure is obvious. The side walls of a true balloon tire are lighter and more flexible than those of a high-pressure tire, because the tire is supposed to yield to minor obstacles, such as stones in the road, instead of riding over them. Experiments have shown that balloon tires, when properly selected, should be as enduring and give as long life as the high-pressure tires they replace. It is also stated that they are not liable to puncture any quicker than tires having heavier side walls and treads, because they yield and throw aside a puncturing object which would penetrate a more rigid tire.

Most motor vehicles are sold with a very complete equipment. Stock cars are furnished with bumpers, luggage carriers, rear stop signals, windshield cleaners, shock absorbers, thermostatic water-circulation regulators, disc wheels, and numerous other devices. Bodies were greatly improved in appearance, and even those fitted to low-price chassis were complete in appointments and graceful in outline. The demand was increasing for closed cars of the sedan and coupé type, and the majority of people purchasing new cars were ordering the all-year, all-weather closed bodies instead of the open models. A new process of body painting greatly increased the life of the finish over the process which, developed in carriage shops, was formerly almost exclusively used for motor vehicles. Instead of being applied with a brush, the new material, a modified pyroxilin lacquer, is sprayed on the body; when it hardens it gives a celluloid-like coating which cannot be scratched by dust, affected by road tar, cracked by extremes of heat and cold, or deteriorated by exposure to weather. The high finish obtained by the use of gloss varnish is lacking, but a practical finish is secured which does not soon lose its lustre.

Commercial Vehicles. In the field of commercial vehicles, the most marked development of the decade 1914-24 was in motor busses for transportation as a public utility. Busses came to be operated with much success in city services as auxiliaries to the electric street railways, as well as traction line feeders, on inter-city lines, for de luxe tours, for schools, and for sightseeing. They have become a very definite part of the United States' transportation system. Just as motor trucks successfully proved their economy and dependability as independent freight

carriers, the motor bus was fast becoming a vital factor in passenger transportation. Special chassis designs were evolved for carrying bus bodies. By dropping front axles, undersliding the front and rear springs, and in some instances having the frame side members dropped between the springs, busses were evolved which were easy of access and had a low centre of gravity. When a bus body is mounted on the usual type of commercial automobile chassis, it is apt to sway in turning corners, to skid on slippery streets, and to be uncomfortable for passengers. In order to secure easy riding, special spring suspensions and giant pneumatic tires are employed.

Very heavy loads are now carried on large cord tires, and even freight trucks are carried by the more resilient instead of the solid rubber tires. Truck tires are made 8 to 10 inches in width and 40 to 42 inches in diameter, with extra-heavy treads and side walls so that internal pressures from 120 to 130 pounds may be safely withstood. Bus bodies are sometimes carried by special resilient supports, either in the form of rubber pads or metal spring members attached to the chassis frame. One marked improvement was the use of rubber shock absorbers or insulators at the spring ends to replace metal shackles, which soon wear. It is stated that a life of 100,000 miles is not uncommon with the rubber insulators, which act to reduce vibration. The rubber blocks are molded in suitable shapes to carry the spring leaf ends and permit the spring leaves to flatten out under load and to move as the spring deflects under the influence of varying highway surface contour. The blocks of rubber are carried in malleable iron housings forming part of the chassis and are easily renewed when worn.

Motor Rail Cars. Many railroad lines have lost so much of their freight and passenger traffic because of the greatly increasing use of motor vehicles that they have found it unprofitable to operate the usual steam train on short lines. The modification of the motor vehicle known as the rail car has come to the rescue, and motor-truck engineering is followed in many respects. In some cases, the rubber-tired wheels are replaced with flanged metal wheels adapted to run on rails; no other change is made in the chassis. The use of antifriction bearings of the ball and roller type, alloy steels, and aluminum and pressed-steel sections assures heavy-duty qualifications with the economy of light weight. The power plant, change speed gearing, clutch, and power transmission are modified from motor-truck types. The engines are truck engines and usually of the four-cylinder type. Between the engine and the main transmission an auxiliary reverse transmission is installed which serves to change the direction of main drive shaft rotation when it is desired to reverse the car, and as many reverse speeds as there are forward drive ratios are thus provided. Small rail cars with a passenger capacity of 30

SIDE ELEVATION OF CHASSIS FOR MOTOR BUS

Four driven wheels are employed to support load. Note drop frame to provide low centre of gravity.

persons may be operated for \$.30 per car mile, and as the rate on short line work may be from \$.04 to \$.05 per mile per passenger, such cars can show a profit even if the car does not carry its full capacity on all trips. These cars climb grades well and are controlled much like a motor truck: the engine speed is varied by spark and throttle control; gear shift is made by lever, and the clutch is actuated by pedal control. Of course, the operator is relieved of steering; when a wheel is provided, it is used to operate one set of brakes. Most rail cars are provided with air brakes.

Unit Containers. In freight transportation, containers usually thought of as individual boxes, which can be loaded and sealed by the shipper and transported to the consignee on motor-truck chassis, freight car, boat, or all three, without disturbing the contents, offer great possibilities in the coordination of all transportation facilities and the expediting of freight movement. Some motor-truck manufacturers supply special chassis for handling unit containers, in which mechanism actuated by the engine to facilitate moving them is incorporated in the truck chassis. The demountable body in its various forms was in some use in many parts of the country. It is probably more adaptable for general purposes of motor cartage than the unit goods container.

American Motor Vehicle Industry. The magnitude of the motor vehicle industry can be grasped by considering a few production figures for 1923. It is stated that in the United States over 3,636,500 passenger cars were produced; of this number 80 per cent of the output were cars selling at less than \$1000. Of all these cars, 33 per cent were closed models. Over 300,000 motor trucks were built, and 45,000 motorcycles were delivered. The growing use of the tractor is reflected by a production of 125,000. The number of cars in use can be realized by the production of tires; 40,000,000 shoes and tubes were needed to supply the demand. That the United States was very much in the lead in producing motor vehicles is evident from a comparison of its production with that of Europe. France produced 125,000 passenger cars and trucks; England, 78,000; and Germany, 35,000 motor vehicles. One American manufacturer, Ford, produced more automotive vehicles in a month than the 80 manufacturers of France did in a year, with the English production thrown in for good measure; over 200,000 cars and trucks have been turned out of the Ford shops in 30 days.

In 1912, 356,000 passenger cars were built, with a total value of \$335,000,000. In 1923, the 3,636,500 passenger cars had a value of \$2,250,000,000 in round numbers. In 1912, 22,000 motor trucks valued at \$43,000,000 were made. In 1923, 376,257 trucks valued at \$267,500,000 were produced. It was stated by *Automotive Industries* in its statistical number for 1924 that 18,241,477 cars and trucks were in use in the world, and of this number over 15,000,000 were in use in the United States. A few figures will be of interest in showing how the automotive industry helps other industries. In 1923, 41,400,000 square feet of plate glass was built into automobile bodies and windshields. Of leather and imitation leather, 246,840,000 square feet was used; upholstery cloth consumption was 18,585,600 yards. The industry used 32,089,200 square feet of top material.

The automotive consumption of steel in its

various forms was 11 per cent of the total tonnage and 16 per cent of the total output value. It is stated that 3,470,000 tons of steel, valued at \$300,038,000, were used. Each of the States of California, New York, Ohio, and Pennsylvania has over 1,000,000 cars and trucks registered; New York leads with 1,214,642 registrations, and California follows closely with 1,100,283. In spite of these staggering figures, the saturation point did not appear to have been reached by 1924. Reckoning the life of the average motor vehicle at five years, the industry would have to produce over 3,000,000 motor vehicles every year just to replace those worn out in service. Over 2,750,000 persons are employed in the motor vehicle industry and closely allied lines. The gasoline consumption for 1923 was 5,404,184,000 gallons. To keep the vast number of automotive vehicles in repair there are over 70,000 service stations and repair shops. Nearly 50,000 car and truck dealers supply the demand for vehicles, and 66,000 supply stores take care of the demand for accessories. Nearly every suburban home of persons in moderate circumstances now has either a one- or two-car garage, and over 50,000 large public garages are needed in the United States to provide storage facilities for people living in congested areas. See **INTERNAL-COMBUSTION ENGINES; ARTILLERY.**

MOULTON, ARTHUR WHELOCK (1873-). An American bishop, born at Worcester, Mass., and educated at Hobart College, the General Theological Seminary, and the Episcopal Theological School. He was ordained a priest in the Protestant Episcopal Church in 1901. From 1900 to 1918 he was curate and rector of Grace Church, Lawrence, Mass. He served in the War as a chaplain in the field artillery and at a base hospital in France. In 1920 he was consecrated bishop of Utah. He wrote *Memoir of Augustine H. Amory* (1909), and *It Came to Pass* (1916).

MT. EVEREST. See **EXPLORATION, Asia.**

MT. HOLYOKE COLLEGE. A college for women at South Hadley, Mass., founded as a seminary in 1837 and given the college charter in 1888. The enrollment increased from 790 in 1914 to 864 in 1918, dropped to about 800 for each of the succeeding years until 1923-24, when it rose to 946. The faculty increased from 114 to 134 members during the decade. The library grew from 64,000 volumes in 1916 to 82,852 in 1924. A \$3,000,000 endowment fund was nearly achieved. The student-alumnæ hall, containing an auditorium, banquet rooms, committee rooms, etc., was built in 1916; Williston Hall, the biological building burned in 1917, was replaced by a temporary building in the next year and by a new permanent building in process of construction in 1923-24. Two new dormitories were built in the latter year, one to replace Rockefeller Hall, which was destroyed by fire in December, 1922. In 1919 an alternative method of matriculation by comprehensive examinations as well as by examination in individual subjects was instituted, and the former method of matriculation by certificate from approved schools was discarded. In 1923, a general examination in the senior year on work in the major subject was made a prerequisite of graduation. President, Mary Emma Woolley, A.M., LL.D., Litt D., L.H.D.

MOVING PICTURES. The 10 years from 1914 to 1924 witnessed an extraordinary de-

velopment of the moving pictures, as an art, as an industry, and as an educational medium. Before 1914, the moving picture was regarded as a "freakish fad" which would enjoy its temporary period of popularity and would vanish; since then, the moving picture became firmly established as the only truly universal form of entertainment in the world. There is a steady increase in the number of theatres and of patrons, and in the number of schools, colleges, churches, and industrial corporations using the moving picture for educational purposes. There were in 1924 approximately 18,000 film theatres in the United States, with an average daily attendance of 12,000,000. In 10 days, the paid admissions at film theatres equal the total population of the country. The same figures, of course, do not apply to other countries, as the United States was actually the birthplace of the moving picture, and was furnishing in 1924 over 90 per cent of the world's supply of films. But in Europe, and particularly in Great Britain, France, and Italy, the popularity of the cinema was incredibly great. The gradual rehabilitation of Germany was resulting in increasing interest in moving-picture exhibition and production. South America and Japan were both enormous fields for the distribution of pictures. In Australia, it was estimated that half the total population attended the film theatres every week, a higher average, unquestionably, than in any country outside the United States.

The centre of moving-picture production was established in Los Angeles, Cal., in 1914, and that city, together with its suburbs, notably Hollywood and Culver City, attracted most of the large producing units. New York City, always the financial centre of the industry, was second to Los Angeles in point of production, although in later years there was a marked tendency to move the studios nearer to the source of capital. The number of producing units outside these two localities was negligible.

There are six stages in the preparation of a moving picture. First, its story is purchased from the author; secondly, it is adapted to the screen by a continuity writer; thirdly, the director and the cast are chosen; fourthly, it is actually photographed in the studio and at suitable exterior locations; fifthly, it is assembled in crude form and equipped with "subtitles" or "captions"; sixthly, it is edited and cut down to the required length. The unit of moving-picture measurement is the "reel," which contains about 980 feet of film. Pictures may be of any length, from 1 reel to 12, although 5, 6, or 7 reels is the average for so-called "feature pictures." The running time for one reel through a projection machine is approximately 12 minutes. The film itself is manufactured of a standard size and material so as to be available for use in projection machines in all countries of the world. After the completion of a moving picture, it goes through three stages: exploitation, distribution, and exhibition. For purposes of distribution, the United States is divided into exchange districts. Copies of the pictures are delivered to the exchanges and are rented through them to the theatre owners for purposes of exhibition. This service is given at various fixed rates to the exhibitor, the rate depending on the assumed value of each picture and depreciating as time goes on and the picture assumes wider circulation. "First-run houses," theatres which show pictures which

have not been exhibited in their district before, sometimes pay as much as \$20,000 for the rental of a picture for one week. So high are the running expenses of such theatres that it is often necessary for them to take in \$25,000 a week at the box-office before they can declare a profit.

The amazing progress of the moving picture has depended almost entirely on the development of the photoplay as a medium of entertainment. It is through this form that the moving picture achieves its widest popular appeal. The original photographs are made not only in the large moving-picture studios that have become so common, but it is often desirable to transport a company of actors long distances to make even one reel under the exact natural surroundings called for by the story to give it a proper historical setting. Thus, some films have been made in the desert of Sahara, in the South Seas, or in the most inaccessible portions of the Alps. Examples of pictures thus produced were *If Winter Comes* (England), *Ben Hur* (Italy), *The Arab* (Tunis), *The White Sister* (Italy) and *The Bright Shawl* (Cuba). All these were made by American producing companies, with American actors and American technical staffs. The first photoplays were one or two reels in length, but with the production in 1912 of *Queen Elizabeth* and *The Prisoner of Zenda*, the vogue of the "feature film" commenced. From then on, it became necessary to protract all photoplay stories to five reels, or about 5000 linear feet of film, whether the conditions warranted it or not. Victor Hugo's *Les Misérables* and Rudyard Kipling's *A Man There Was* had to be shortened and lengthened, respectively, until they approached a common size. In 1915, however, David Wark Griffith revolutionized all the theories of motion-picture production with *The Birth of a Nation*, which was the first multiple-reel photoplay. He proved that one picture could provide an entire evening's entertainment, and that the public would pay as much to see it as they would pay to see a play on the speaking stage. Consequently, *The Birth of a Nation* paved the way for a great flood of 8-, 10- and 12-reel pictures. Another type of photoplay, the serial, came into popular favor at this time. The serial is presented in episodic form, two reels at a time, and is usually melodramatic in nature, so that the suspense will be carried over from week to week. Most serials average 30 reels in total length, although several have materially exceeded that number.

The development of the photoplay has rested with a few genuine artists and a host of imitators. Griffith, in *The Birth of a Nation*, introduced the first battle scenes, and his pictures of the Civil War served as models for all the war pictures made between 1914 and 1919. Mary Pickford's popularity inspired countless golden-haired ingenues, just as Charlie Chaplin caused all film comedians to adopt black mustaches and grotesque shoes. William S. Hart was responsible for the Wild West cowboy melodramas, and Douglas Fairbanks for the acrobatic-hero farce-comedies. When George Loane Tucker produced *The Miracle Man*, he promoted a wave of religious enthusiasm in the films. The success of Theda Bara in *A Fool There Was* started the "vampire" craze which lasted for several years. In the same way, the demand for "mother-love" themes originated with *Humoresque* and for symbolism with Griffith's *Intolerance*. The Richard Barthelmess picture, *To Pable*

David, created a vogue for rugged mountaineer dramas; Rex Ingram's production, *The Four Horsemen of the Apocalypse*, inspired many imitators to dwell on the terrible ravages of war; and *The Covered Wagon* promoted a revival of interest in the pioneer days when the West was first settled. After the War the screen reflected the general trend toward realism, and so-called "costume dramas" in historical settings fell into popular disfavor. But then, for the first time in seven years, films were imported from Germany, and they tended to reverse the situation. The first of these, *Passion*, was based on the story of Madame DuBarry and the French Revolution, and it was followed by a number of others, including *Deception*, *Gypsy Blood* and *The Loves of Pharaoh*—all costume dramas. Not all of these German pictures were successful financially, but they inspired many American producers to attempt photoplays of a historical nature. Examples of films that demonstrate this influence are Douglas Fairbanks's *The Three Musketeers* and *Robin Hood*, and Griffith's *Orphans of the Storm* and *America*.

The Germans also introduced a distinct innovation, the futuristic photoplay, as exemplified by *The Cabinet of Dr. Caligari* and *The Golem*. These two pictures proved that the effect of a supernatural story may be vastly increased by the use of weird, impressionistic settings. They disclosed a fourth dimension on the screen. The great possibilities of the screen as a medium for the development of fantasy were demonstrated with startling effect by Douglas Fairbanks in *The Thief of Bagdad*. It was also proved in a number of notable productions that a moving-picture camera could photograph the subtler emotions, and that screen drama could be derived from the minutest details as successfully as from the most stupendous pictorial effects. A whole new school of moving-picture direction arose as a result, and its products were increasingly in evidence. In this way, the moving picture again invaded the particular province of the stage. *The Dramatic Life of Abraham Lincoln* represented the first attempt at a biography on the screen. It told the story of Lincoln's life with no superficial fictional frills added, and its success attested the popularity which this sort of narrative might achieve. It will be seen that the photoplay is rapidly emerging from its early limitations. It no longer depends on swift-moving melodrama, violent action, and expansive scenic investiture; it is relying more and more on delicacy and subtlety; it is delving deeper into the profundities of human emotion.

While the photoplay has effected substantial progress, other moving-picture forms have not stood still. The number of non-dramatic films produced each year is increasing at an enormous rate. Several companies are devoted exclusively to the production of travel pictures, which form a regular feature of almost every programme. One of these, *Nanook of the North*, was released as a regular "feature" and achieved considerable popularity. Showing the life of the Eskimo, it possessed anthropological as well as geographic value, and served to concentrate interest on the possibilities of this type of film. Yale University produced an inclusive history of the United States, in short installments, picturing all the major events from the landing of Columbus to the present; the educational value of such a work is obvious. The story of the Bible

has been similarly set forth on the screen. Moving pictures have been used widely by the various "Safety First" movements, by the Boy Scouts, by charitable institutions, by boards of trade, by anti-tuberculosis crusaders, by the Young Men's Christian Association, and by departments of the United States government for purposes of propaganda or public instruction. They are exhibited regularly in many prisons for the entertainment and diversion of the inmates. The most important field for moving pictures, aside from the photoplay, is the recording of news events. Every theatre includes a "news reel" on every bill, and the preparation of these pictures entails great expense and much work in all parts of the world. A fairly complete record of the War was made by the thousands of cameramen who followed the armies and navies and will remain as a historical document of vast importance. Four weeks after the Japanese earthquake, in September, 1923, pictures of the devastation caused by it and of the subsequent relief work were being shown all over the United States. During the War aeroplane photography was developed extensively because of its obvious military value. The moving picture was used to record the effects of shell fire, enemy operations, and strategic positions. Similar strides were made in submarine photography. By placing a camera in a water-tight compartment, which is lowered into the water, pictures of submarine life were made at great depths.

Since the invention of the moving picture and the realization of its practicability, scientists and engineers have concentrated on two developments: color photography and the synchronization of pictures and sound. Both of these problems have proved extremely difficult of solution, and neither has as yet approached perfection in its solution. Many color processes are in use, but none of them is really adequate, and all are expensive. The necessity of employing only two primary colors, on either side of the film, has placed a distinct limitation on this form of photography, and while certain colors, notably reds, may stand out effectively, others, notably natural greens, will present a false and washed-out appearance. Hand coloring has been employed at various times, but this process is slow, arduous and prohibitively costly. At the coronation of King George V, and the subsequent Durbar in India, Charles Urban made moving pictures with the Kinemacolor process; but these were crude and productive of considerable eye strain. Following this, color was used only in travel pictures and in the photography of rare flowers, birds, or precious stones. The first full-length photoplay to be made entirely in color was *The Glorious Adventure*, a costume drama of the Restoration period in England, which failed of substantial success. With the development of the Technicolor process, color photography made a distinct advance, and this has been used successively in several pictures, notably *Toll of the Sea*, *the Ten Commandments*, and *Wanderer of the Wasteland*. Considerably less progress was made in the perfection of talking-moving pictures. Edison's kinetophone, (q.v.), first put before the public in 1912, was an almost total failure, as were the devices developed by Gaumont and Clermont-Huet in Europe at the same time. All these processes attempted to achieve synchronization between pictures and sound by means of a phonograph at-

tached to the controlling current of the projection machine. More recently Dr. Lee De Forest made successful experiments in photographing the human voice, converting sound waves into light waves, and so reproducing them on film. This discovery led him to the development of the Phonofilm, on which are photographed both the pictures and the sound at the same time. When run through the projection machine, the light waves are converted back into sound waves and transmitted through a microphone, so that the synchronization is necessarily perfect. No attempt has been made to produce a full-length picture with this process, but it has been used successfully in transcribing short speeches and in reproducing musical scores. Dr. De Forrest made a complete record of the musical score of *The Covered Wagon* and reproduced it on the film itself, so that the picture might be shown with its own orchestral accompaniment.

In 1909 the National Board of Censorship was organized for the purpose of regulating the moral tone of photoplays. This was a voluntary, unofficial group, with no legal standing, and was formed by the moving-picture producers themselves. With the advent of official State and municipal censorship, the National Board was rendered obsolete; local governments took its work into their own hands. Seven States enacted moving-picture censorship laws (Pennsylvania, Ohio, Kansas, Maryland, Florida, Virginia, New York), and similar measures were adopted in numerous cities and towns. Censorship became a formidable menace, in view of the fact that different standards obtained in different localities. There have been cases of the total rejection of a picture in one State and its approval, unchanged, in another. Often pictures are so materially cut by censor boards as to make them utterly unintelligible. Thus, photoplays must frequently undergo radical revision every time they pass a State line. This situation, of course, has worked great havoc on the moving-picture industry, and determined efforts have been made to defeat censorship bills wherever they have been proposed. With this idea in mind, the Motion Picture Producers' and Distributors' Association was formed in 1922, with Will H. Hays as its president. Since then, moving-picture censorship has gained no ground. It was decisively defeated by popular referendum in Massachusetts in 1922 and has been effectively kept out of the statute books in 14 other States since then. In the meantime, the Hays organization coöperated extensively with women's clubs and civic organizations in an effort to censor moving pictures from within.

The moving-picture play as a distinct artistic form grew out of the moving picture in much the same way as the regular drama developed from the crude mimicry of early times. The process of evolution in the one case, however, occupied only a few years, while in the other it extended over centuries. Just as the most primitive forms of drama were probably no more than rude attempts to portray or caricature actual events in the lives of persons and animals, so the first moving pictures were mere photographic transcripts from life, with little or no attempt at artistic arrangement.

But when the public had once become accustomed to the novelty of the moving picture there was a natural falling off in attendance at the places of exhibition, and it became necessary to invent some further means of entertainment.

The exhibitors hit upon the obvious device of telling a story by means of the pictures. At first the attempts were confined largely to broad comedy or farce of the slap-stick variety; but the popular success of these crude efforts opened the eyes of both public and producers to the artistic possibilities of the new form of entertainment, and photographic dramatizations of popular stories and plays began to appear.

These attempts at story-telling were decided improvements over the original pictures. They were far from satisfactory, however, because the producers had not yet realized that a new technique was necessary and were trying merely to duplicate the effects of the legitimate stage. It was only after long experiment that the advantages and limitations of the art as a distinct form revealed themselves and the moving-picture play as we know it to-day was evolved.

Technically the new form is perhaps more closely related to pantomime than to drama. There is this essential difference, however: in pantomime we accept the convention that there is a race of beings whose natural language is gesture and who are therefore capable of expressing all their thoughts and emotions without the assistance of words, while in the motion picture we imagine the characters to be speaking as in ordinary life though, by convention, we are unable to hear them.

It is this convention of silence which has imposed the chief limitations on the moving-picture play as an artistic form. So long as the characters in the moving-picture play can express nothing that cannot be conveyed by means of gesture or facial expression the moving-picture playwright would naturally be limited in the choice and treatment of his theme to the more elemental emotions. The moving-picture play does not, as a rule, therefore, attempt to deal in psychological subtleties or nice shades of character, but relies for its effect mainly on plot, as does the pantomime. It has an advantage over pantomime, though, in its use of captions or leaders. These are printed matter—inscriptions, letters, dialogue, headings, etc.—thrown on the screen to explain a scene or sequence of scenes that would not be intelligible from the acting alone; but the tendency, however, is to dispense with these devices wherever possible and allow the story to unfold itself in action. Nevertheless, as noted above, there were signs in the latter part of the decade under review that the motion picture could enter further into the psychological domain than had been supposed, and there were a number of film productions in 1923 and 1924 which by the skillful use of suggestive detail and by a more confident appeal to the imagination of the audience vied with the best of the stage plays in expressing the subtler emotions.

In structure the moving-picture play follows the Elizabethan rather than the modern tradition. Change of scene is frequent, and there is no obligation on the part of the playwright to arrange the events of his story so as to fall into the ordinary divisions of time and space which is obligatory to the contemporary legitimate dramatist. If in the course of the play some of the characters move from Europe to America, the spectators may take passage with them and witness the events on the journey; if the hero and heroine steal into the garden for five minutes, they may follow and see precisely what

happens instead of trusting their report when they return to the drawing room. This flexibility of form lends an impression of greater continuity in action and makes possible a wealth of detail and added air of veracity that renders the moving-picture play a dangerous rival to the type of regular drama in which character and psychology are subordinate to plot. Already there is a tendency on the part of writers of melodrama to imitate the dramaturgy of the moving-picture play.

It is in connection with the representation of dramatic scenes in the form of so-called photoplays that the moving-picture industry finds its widest application. Depicting current events in this way of course aroused interest, but this does not bulk large in connection with the portrayal of successive scenes from some new or standard play in which the action follows along rapidly and emphasizes the dramatic succession of incidents. This involves the reduction of a play to a simple scenario or story, or it may be the construction of a scenario or outline from new and original ideas. Once this is done the work of staging and photographing the scenes must be started. This involves large expense and considerable time, as many of the situations may be modified as the work proceeds, to give them proper dramatic value and effect. For production on the large scale that is now necessary, when moving-picture plays as regards not only elaboration but even in prices charged for admission and seats are in some cases put on a level with actual stage productions, extensive workshops and large studios are increasingly common. Several photoplays may be in process of production simultaneously, and a large force of costume makers, scene painters and other assistants are employed, together with the necessary workshops for developing and finishing the films as rapidly as possible. The expense for the duplication of a film, once it is made, is not large proportionately, and as soon as films are released for rental the profits, according to the popularity of the subjects, are very large. When a film has been made and found satisfactory for exhibition it is imprinted with the name of the manufacturer and copyrighted. A film may be run about 500 times in the hands of a careful operator before its condition renders its projection unsatisfactory by reason of streaks and spots that appear greatly magnified upon the screen; in addition to which there is a certain increased fire danger from the frayed and split condition of the edges when exposed to the intense heat in front of the lantern.

MOWREER, PAUL SCOTT (1887-). An American newspaper correspondent, born in Bloomington, Ill. He studied at the University of Michigan and began his newspaper career as a reporter in Chicago, in 1905. He was a correspondent at the front in the 1st Balkan War and again in the War in Europe from 1914 to 1918. In 1921 he acted as special correspondent of the Disarmament Conference. He wrote *Hours of France*, poems (1918), and *Balkanized Europe—a Study in Political Analysis and Reconstruction* (1921). He also contributed many articles to magazines on world politics.

MUDANIA, ARMISTICE OF. See PEACE CONFERENCE AND TREATIES; SMYRNA; TURKEY.

MÜLLER, GEORG ELIAS (1850-). A German psychologist. He completed his analysis of memory (*Analyse der Gedächtnis-Stetigkeit*) in 1917. As representative of the associationistic school, he opposed the relativistic notions of the proponents of the *Gestaltpsychologie* (see PSYCHOLOGY, Perception). His book on *Complextheorie und Gestalttheorie, ein Beitrag zur Wahrnehmungs Psychologie* (1923), is a defense of associationism against its critics.

MÜLLER, HANS (1882-). An Austrian writer and dramatist, born at Brunn, and educated at the University of Vienna. He traveled extensively in Germany, Austria, Italy, France, Belgium, Holland, and England. He is the author of *Dammer* (1900); *Die Lockende Geige* (1903); *Der Garten des Lebens*, a Biblical epic (1904); and *Die Rosenlaube* (1909), all verse. He also wrote several volumes of fiction, among them *Buch der Abenteuer* (1905), *Geheimnissland* (1909), and *Traume und Schaume* (1911), besides a volume of sketches, *Die Kunst Sich zu Freuen* (1917). His reputation rests chiefly on his plays, which include: *Das Wunder des Beatus* (1910); *Gesinnung* (1912); *Der Reizende Adrian* (1913); *Die Blaue Kuste* (1914); *Könige* (1915); *Violante* (1916); *Der Schöpfer* (1918); and *Die Sterne* and *Die Flamme* (1920).

MÜLLER-FREIENFELS, RICHARD (1882-). A German writer, born at Ems, and educated at the universities of Munich, Berlin, Geneva, Tübingen, Paris, London, and Zurich. He traveled in Europe, Asia, and Africa. His works include: *Psychologie der Kunst* (1912); *Deutsche Denker und die Phantasie* (1916); *Personlichkeit und Weltanschauung* (1918); *Psychologie der Religion* (1920); *Philosophie des Individualismus* (1920); *Psychologie des Deutschen Menschen* (1921); *Bildungsdeeen und Erziehungsmöglichkeiten* (1921); and *Irrationalismus* (1922).

MÜLLER-URY, ADOLFO (1864-). A Swiss-American portrait painter (see VOL. XVI). He painted a portrait of Mrs. Woodrow Wilson (1916); of President Wilson delivering his "war speech" before Congress on Apr. 3, 1917; of Cardinal Mercier, during his visit to the United States, for the Catholic University at Washington; of Pope Pius XI in 1922, and many others.

MUNDELEIN, GEORGE WILLIAM (1872-). An American cardinal, born in New York City, and educated at Manhattan College, St. Vincent Seminary, and in Rome. He was ordained priest in 1895 and served as associate secretary to the bishop and as pastor in Williamsburg, Pa., from 1895 to 1897. From the latter year until 1909 he was chancellor of this diocese. In 1903 he was appointed censor of the Liturgical Academy, the only American holding that office. In 1906 he received the appointment of domestic prelate and in 1909 was appointed titular bishop of Loryma and auxiliary bishop of Brooklyn, N. Y. He held this office until 1916, when he was made archbishop of Chicago. In 1924 he was elevated to the rank of cardinal.
